Italian Parliament opening, 474. Death of Mazzini, 946.

ASIA.—Wreck of a Steamer, 154. Famine in Persia, 154. Terrific Storms in China, 154. Japanese Order of the Daimios abolished, 154. The Town of Shamaka destroyed by an Earthquake, 794. Lord Mayo, Governor-General of India, assassinated, 794. Revolution in Philippine Islands, 794. British Expedition against the Looshais in India, 794.

AFRICA.—Collision of Steamers, and drowning of 75 Pilgrims, 474.

EDITOR'S LITERARY RECORD.

Herbert Spencer's Principles of Psychology, 138. Professor Bascom's Science, Philosophy, and Religion, 139. Porter's Elements of Intellectual Science, 139. Arnot's Parables of our Lord, 139. Cuyler's Heart Life, 139. Gardiner's Harmony of the Gospels, 139. Miller's Songs of the Sierras, 140. Bryant's Odyssey, 140. Fetridge's Paris Commune, 141. Juvenile Books, 142. Miscellaneous, 143. Reclus's The Earth, 296. Dana's Corals and Coral Islands, 297. Abbott's Water and Land, 297. Prime's Around the World, 297. A Boy's Journey round the World, 297. Abbott's The Baby's Things, 297. Songs of the Heart, 297. Saunders's Festival of Song, 298. Songs of the Spirit, 298. Poets of the Nineteenth Century (New Edition), 298. Miscellaneous Holiday Books, 298. Dogs and their Doings, 299. Du Chailu's Country of the Dwarfs, 299. Richard Vandermark, 300. Farjeon's Joshua Marvel, 300. Mrs. Craik's Hannah, 300. Children's Stories, 300. Tuckerman's Life of John P. Kennedy, 301. Miscellaneous, 301. Culture and Religion in some of their Relations, 459. Park Street Pulpit, 459. Pond's The Seals Opened, 459. Barrows's Sacred Geography and Antiquities, 459. Collected Writings of J. H. Thornwell, 459. Meline's Mary Queen of Scots, 460. Rawlinson's Five Great Monarchies, 460. Smith's Ancient History of the East, 460. Lossing's History of England, 461. Life and Letters of Catharine M. Sedgwick, 461. Abbott's Louis Philippe, 461. Hallam's Middle Ages, 461. Longfellow's Divine Tragedy, 461. Butler's Poems, 462. Whittier's Child Life, 462. Words of Cheer for the Master's Workers, 462. T. A. Trollope's Durnton Abbey, 462. Miss Marryat's Prey of the Gods, 462. Mrs. Stowe's My Wife and I, 462. Mrs. Whitney's Real Folks, 463. Miss Alcott's Aunt Jo's Scrap-Bag, 463. Miscellaneous, 463, 464. Paine's Physiology of the Soul and Instinct,

as distinguished from Materialism, 618. Tyerman's Life and Times of John Wesley, 618. Taine's History of English Literature, 619. Forster's Life of Charles Dickens, 619. Chicago and the Great Conflagration, 620. Alford's Greek Testament, 620. Walden's Our English Bible and its Ancestors, 621. Bacon's Inside View of the Vatican Council, 621. Beard's Eating and Drinking, 621. Hinton's Health and its Conditions, 621. Nichols's Fireside Science, 621. Half-Hours with Modern Scientists, 621. De Vere's Americanisms, 622. Eggleston's Hoosier School-Master, 622. Smith and Schaff's Theological and Philosophical Library, 777. Manning's Half Truths and The Truth, 777. Jowett's Dialogues of Plato, 777. Moffat's Comparative History of Religions, 778. Max Müller's Science of Religion, 778. Porter's Sciences of Nature versus the Science of Man, 778. David's Positivist Primer, 778. M'Clincktock and Strong's Cyclopædia of Biblical, Theological, and Ecclesiastical Literature, 778. Van Oosterzee's Theology of the New Testament, 779. Farjeon's Blade-o'-Grass, 779. Collins's Poor Miss Finch, 780. Mrs. Buddington's Can the Old Love? 780. Cecil's Tryst, 780. Miscellaneous, 780, 781, 782. Fields's Yesterdays with Authors, 933. Drake's Dictionary of American Biography, 934. King's Mountaineering in the Sierra Nevadas, 934. H. H.'s Bits of Travel, 934. Hawthorne's French and Italian Journals, 934. Johnson's Translation of Lucretius, 934. Platt's Landmarks, and Other Poems, 934. Figuiet's The To-morrow of Death, 935. Talmage's Abominations of Modern Society, 935. Deems's Life of Jesus, 935. Baring-Gould's Legends of the Patriarchs and Prophets, 936. De Mille's American Baron, 936. De Forest's Overland and Kate Beaumont, 936. Miscellaneous, 936.

EDITOR'S SCIENTIFIC RECORD.

Cutting Glass and Stone by Sand Blast, 143. Extraction of Copper from refuse Pyrites, 143. Poisonous Animal Emanations, 143. Metallic Soap, 143. Artificial Porphyry, 143. Pelouze Method of preserving Meat, 144. Metachloral, 144. Removal of

Grease Spots, 144. Poison Serpents in India, 144. Animal Origin of Petroleum, 144. Keeping Fish fresh with Sugar, 144. Extraction of Aniline Dyes from Fabrics, 144. Cost of Artificial Ice, 145. Photographing Magnetic Curves, 145. Effect of Cold on

EDITOR'S SCIENTIFIC RECORD—Continued.

Iron and Steel, 146. Preparation of Albumen from Blood, 146. Theory of Cholera, 146. Dyeing Wool Aniline Blue, 146. Difference of Mean Temperature at various Heights, 146. Combustion of Coal Dust, 146. Extirpation of Serpents in the West Indies, 146. A new Cinchona Alkaloid, 147. Industrial Novelties in the London Exhibition of 1871, 147. Chloral Hydrate and Cod-liver Oil, 147. Asepsin, 147. Habit of Horned Toad, 147. Hydrobromate of Codeia, etc., 148. An Eighth Rib in Man, 148. Acetate of Zinc a Precipitate of Hæmin, 148. Mind in lower Animals, 148. Barytes White, 148. Teeth of the Sturgeon, 148. Was the Pre-glacial Heat caused by a Meteoric Body? 148. Copying Pictures by Collodion, 149. Hydramyle, 149. Extinction of the Moa, 149. Coccoliths of Vegetable, not Animal Origin, 149. Are frozen Plants killed in freezing or in thawing? 149. Electro-Acupuncture of the Arch of the Aorta, 150. Calvert on Spontaneous Generation, 150. Mr. William Thompson on Darwinianism, 150. M'Donald's Theory of Nervous Action, 150. Physics of Arctic Ice in Scotland, 150. Scarcity of Remains of the Upper Jaw of Marsupials, 150. Vertebrates of Australia, 151. Cleaning Diatoms, 151. Fungi in Potable Water, 151. Asphalt for Paving, 151. Test for Benzole, 151. Apenite, a new Building Material, 151. Pincus on Hair Disease, 151. Silk-worm Rearing in California, 152. Cœrulein, a new Coloring Matter, 152. Rats in the Laccadive Islands, 152. Parkes's Improvement in the Manufacture of Steel and Iron, 152. Prize for Rhea Fibre Machines, 152. Printing on Tin, 152. Summary of Scientific Progress, 302. Blue Dye from Molybdenum, 303. Freezing of Water, 304. Action of Magnetism on Gases traversed by Electrical Currents, 304. Influence of Cold on the Strength of Iron, 304. Duckham's Self-indicating Weighing-Machine, 304. Watering Streets with Saline Solutions, 304. Temperature required to kill Microscopic Organisms, 304. Proof of the Nebular Hypothesis by the Spectroscope, 305. Parallax of a Star, 305. New Species of Sieboldia in China, 305. Carbolic Acid in Snake Poisoning, 306. Transparent Green Varnish, 306. Variation of Color in Birds with the Locality, 306. Celestial Origin of Positive Electricity, 306. Graphite in Gray Oxide of Iron, 306. On Nomenclature of Units of Force and Energy, 307. New Coloring Matters, 307. Solvent of Indigo, 307. Malleable Bronze, 307. Arsenious Acid and Albumen, 307. Lieurnur Method of removing Night-Soil, 307. Ointment for Gun-Barrels on the Sea-Shore, 308. Electroplating Metal with Nickel and Cobalt, 308. New Fossil Crustaceans, 308. Water-proofing Preparation, 308. Colors of Fossil Shells, 308. Parkes on Effect of Diet and Exercise on Elimination of Nitrogen, 308. Gilding and Silvering Silk, 308. Inhalation of Dust by Workmen, 309. Illustration of Psychic Force, 309. Nickel and Cobalt Plating in the Wet Way, 309. Duration of Vision, 309. Removing the Smell of Petroleum, 309. Injury of great Battles to Vegetation, 310. Researches upon Tobacco-Smoke, 310. Parchment-Paper, 310. Stones in the Stomach of Cod-Fish, 310. Difference in Gravity of Islands and Continents, 310. Chloromethyl as an Anæsthetic, 310. Balestra on the Miasm of the Pontine Marshes, 311. Cause of the increased Explosiveness of certain Bodies, 311. Report of the Tidal Committee of the British Association, 311. Fletcher's Rhysimeter, 311. Proposed Connection of Science and the British Government, 312. Colombian Cure of the Bite of a Poisonous Serpent, 312. The Nature of Comets, 464. Holmes's Inextinguishable Signal-Lamp, 464. Relation of Radiation in the Tropics to Zodiacal Light, 465. Nutrition of Young Fish in Hatching Establishments, 465. Phosphorous Bronzes, 466. Platycnemic Skeletons in the Denbighshire Caves, 466. Richardson's Hypothesis of a Nervous Ether, 466. Dinas Stone, a new Fire-proof Material, 467. Effect of Heat on Animals, 467. Carnine an Element of Meat Extract, 467. Ammonia Engines, 468. Velocity of Meteoric Stones, 468. Relation of Atomic Weights

of Bodies to their Spectra, 468. Prehistoric Modes of Sepulture, 468. Geology of the Alps, 468. Dambose, an Ingredient of Borneo Caoutchouc, 469. Substitute for Bichromate of Potash, 469. Relations of Ganoids to Plagiostomes, 469. Heat of Combustion of Stone-Coal, 469. Lawn Sand, 469. Cure of Flatulency, 470. Explosion of Gun-Cotton at Stowmarket, 470. Acridine, a new Anthracene Derivative, 470. Peculiar Effects of Curare Poison, 470. Air-Cushion for the Feet in Railway Travel, 470. Effect of diminished Pressure on Animals, 470. On Heat evolved in the Formation of Aqueous Solutions, 471. Carbolic Acid not a perfect Disinfectant, 471. Summary of Scientific Progress, 622. Great Continental Glaciers, 624. New Form of Sensitive Flame, 625. Hygraffinity, 625. Tacchini on the Protuberances of the Sun, 625. Simple Construction of Concave and Convex Mirrors, 625. Microscopical Sections of Rocks, 625. Exploration of the "Grotto of the Dead" in France, 626. Removing the Odor of Carbolic Acid, 626. Characters of pure Glycerine, 626. Preparation of Hides, 626. Influence of Heat on the Human Body, 626. On the Extinct Batrachian Fauna of Ohio, 626. Ornithological Publications in 1870, 627. Elimination of Nitrogen in Cases of Fever, 627. Explosion in the Sun, 627. Change in the Habits of the Kea Parrot of New Zealand, 627. Physiological Action of Aconite, 627. Dextral Pre-eminence, 628. Difference of Bacteria from Fungi, 628. Microscopic Forms in the Atmosphere, 628. Relationship of the Earth's Magnetism to the Rotation of the Sun, 628. Character of Scott's Selenitic Mortar, 629. Physical Atlas of France, 629. Immunity of the Pig from Injury by Serpent Bites, 629. Guatemala as a Resort for Consumptive Persons, 629. Iodized Cotton in Surgery, 629. Cause of Smokiness in Quartz Crystals, 630. Oyster Beds of Germany, 630. Eucalyptus a Febrifuge, 630. Clearing Bean of India, 630. New Location of Tin, 630. Destruction of infected Germs in Cotton, 782. Canada Oil for extracting Fats, 782. Silvering of Glass Plates and Globes, 782. Vogel on the Spectra of the Planets, 783. Action of Anæsthetics on the Nervous Centres, 783. New reducing Agent, 784. Indications of Stopping-Places in Railway Trains, 784. Mental Characteristics of lower Animals, 784. Mineral Cotton, 784. Protest of London Physicians against prescribing Alcohol, 784. Secchi on Solar Protuberances, 785. Dyeing Alpaca with Iodine Green, 785. Preparation of Fuel from fine Coal, 785. Is there a resisting Medium in Space? 785. European Expositions of 1872, 785. Suggestion for dispensing with Smoke-Stacks, 786. Use of Sulphites in Disease, 786. Dank's Puddling Machine, 786. Safety-Matches, 786. New Discoveries of the Mammoth in Siberia, 786. Classification of Odors, 787. Registering Apparatus for Passenger Cars, 787. Influence of Scarcity of Food on Woman's Milk, 787. Preservation of Jelly-Fish, 787. Labels on Bottles, 788. Characteristics of higher Groups of Mammals, 788. Faye's View of the physical Condition of the Sun, 789. New Fossil Sirenian in Belgium, 789. Croton Chloral, a new Hypnotic, 789. Eggs of the Moa, 789. Artificial Epilepsy, 789. Darwinian Idea of the Origin of Insects, 789. Spectrum of the Aurora, 937. Spectrum of the Zodiacal Light, 938. Weakening of Fatal Maladies, 938. The Calorigen—a New Heating Apparatus, 938. New Minerals, 938. Flora of the Canaries, 939. Spectroscopical Phenomena of Argus, 939. Respiration in Fish, 939. Improved Stove, 939. Detection of Alcohol in Water, 939. Stowmarket Gun-cotton Explosion, 939. Variation in the Size of Blood Corpuscles, 939. New North American Serpents, 940. Discovery of a Prehistoric Corpse, 940. Sensibility of Iridium, etc., to Mercurial Vapor, 940. Origin of Nerve Force, 940. Prehistoric Beads, 941. Professor Gill's Arrangement of Mollusks, 941. Sea Water in Bread-Making, 941. Laws of the Winds in Europe, 941. Chemical Inventions in the London Exposition of 1871, 943. Movement of Stars in Space, 943.

ENGLISH IN SCHOOL.....	William Atkinson	373
ETERNAL CITY, THE.....	Lyman Abbott	1

HARPER'S NEW MONTHLY MAGAZINE.

No. CCLIX.—DECEMBER, 1871.—VOL. XLIV.

THE ETERNAL CITY.

SITE OF THE FORUM ROMANUM, FROM THE SLOPE OF THE CAPITOLINE HILL.

Temple of Antoninus and Faustina.

Temple of Saturn.

Excavations on the Site of the Basilica Julia.

Temple of Castor.

SO far back in the remote ages of antiquity that the memory of man, preserving the incident, has failed to preserve the date, a group of ancients gathered on an Italian hill-side to mark by a furrow the boundaries of a city which they proposed to found. Every detail of the required ceremony, at once civil and religious, was observed with care. A lucky day was chosen. The plow was of bronze. It was drawn by a cow and a bull yoked together. The cow was placed on the inner side. The earth was thrown inward.

At every point where a gate was to be erected the plow was lifted and carried across the unbroken sod. So, if we may credit an ancient though not very trustworthy tradition, the city of ceremonies was founded by a ceremony far older than itself. So was established, with no dream of its future greatness, the city which for so many centuries made itself the mistress of the world.

Its first conquests were by its arms. Extending gradually its boundaries, it embraced at last almost the entire civilized

world. "I am a Roman citizen" was passport and safe-conduct in every tribe and province. Falling to pieces, corrupted by its own greatness, the Roman empire lost not its sway, but only changed its sceptre. The emperor gave place to the pope. The

supreme authority was transferred from the palace of the Cæsars to the Vatican. The legions of vanquished soldiers gave way to hordes of invincible monks, the tyranny of a Nero and a Caligula to that of the Inquisition and the Jesuit fathers. And again for centuries Rome ruled the world, which seemed by the irruptions of the Northern barba-

rians to have broken the yoke, which was really only changed, not lightened.

Thus Rome has a double history. There is a classic and there is an ecclesiastical Rome, a pagan and a Christian Rome, a Rome of the Cæsars and a Rome of the popes. And as it has a double history, so there is a double city—a city of antique ruins

Staircase of the Church of Arauceli.

THE TABULAEUM, FROM THE STREET ARAUCELI.—GRAND STAIRCASE.

There is nothing in the site of Rome to account for its imperial supremacy. It has conquered its place in the world's history

despite its location. There is no great military strength in its position. The surrounding country offers no advantages for a great city. Its position debars it from commerce. The Tiber does, indeed, connect it with the sea; but the Tiber, a narrow and rapid stream, is at once too large to be harmless and too small to be of use. Fed by the Apennines, it is, like all mountain streams, subject to sudden changes in the volume of its waters. Again and again it has poured down upon the city which it cuts in two an overwhelming torrent, inundating all the lower portions, and bringing death and desolation with it. Yet it will admit no ships of large burden. Its depth is only from fifteen to

twenty feet, its breadth in Rome but 185, and its tortuous course and rapid current make navigation difficult and dangerous. The surrounding country is so malarious in character that, in certain seasons of the year, a night spent by a stranger without the city walls is almost certain death. The hills are deserted, the valleys but illy cultivated. Yet it is certain that the Campagna did not always possess the character that now belongs to it. The sites of thriving towns, once the peers of Rome itself, are now occupied only by a few shepherds and cattle stalls. The plains once occupied by the magnificent villas of the Roman nobility, where Pliny and Scipio and Augustus and Hadrian had their summer retreats, and where Horace wished he might spend the closing years of his old age, are now abandoned by all who can escape their dangers, while those who remain attest by their gaunt and hollow cheeks and sallow complexions how dangerous is the climate even to those who survive the deadly miasma.

The river Tiber, flowing with a crooked course, but in a general southerly direction, divides the city of Rome into two unequal portions. On the western bank is St. Peter's, and the Vatican, and the Castle of St. Angelo, and the Corsini Palace. Here is what is known as the Leonine City, within which the papal authority is, at the time of our writing, confined. On the eastern bank are the famous Capitoline, Palatine, and Aventine hills; between them and the river lies modern Rome; while in the valley bounded by the Palatine and Capitoline hills on the one side, and the Quirinal and Esquiline hills upon the other, was the ancient Roman Forum, the heart of classic Rome. Here stood the ancient Capitol upon the Capitoline Hill; here in the valley below still stand the remains of many of the ancient temples; here in close proximity are the far-famed arches of Septimius Severus and Titus and Constantine; here is the pavement where Cæsar walked and where Cicero pleaded; while not far distant are the Coliseum, and the palace of the Cæsars, and the baths of Caracalla, and Trajan's Column, and the Pantheon. Thus, by the river and the hills, Rome is divided into three cities—ecclesiastical Rome on the west bank, modern Rome on the east bank, and classic Rome upon the hill-sides and in the intervening valleys still further east. It is to this latter Rome we introduce our reader in these pages.

We take our stand at the foot of Capitoline Hill. The street of Araceli leads us hither from our quarters in the modern city upon the river bank. A double flight of stairs is before us leading up to what constituted the heart of ancient Rome. Usage, if not absolute law, required that the temple of the tutelary deity should be placed upon the point whence the widest view of the city

could be obtained. On the southwest apex of this double hill, therefore, stood the triple temple of Jupiter, Juno, and Minerva, overlooking the surrounding city. On the opposite end stood the citadel of Rome, the impregnable fortress with which every considerable city was provided, and whither, in direst calamity, its soldiery might retreat to make a last defense. Between the two was the *Tabularium*, or, as we should call it, the hall of records, where the archives of the empire were preserved.

We turn to the left, and ascend the long flight of stairs which leads us to the site of the ancient citadel. Classic, sacred, and modern Rome are curiously intermingled in the scene before us. The steps swarm with beggars, who for the love of the Virgin beseech our charity. To beg is no dishonor and hardly a misfortune in Rome. The Church which has canonized poverty can not restrain it. Where saints are beggars, beggary is no reproach. Indiscriminate charity fosters a laziness which perpetuates the vice. While the pope was still master of Rome he gave annually to its paupers two or three thousand crowns. We are not good Romanists. The love of the Virgin has no power over our indurate hearts. We pass the swarm of professional beggars, and enter the Church of Santa Maria Araceli. We give the church the benefit of its full title. But in common conversation no one does so. It is simply the Church of Araceli. Owing to the number of churches erected in Rome to the honor of the Virgin Mary, the first name ceases to be significant, and it is accordingly dropped by common consent.

The Church of Araceli affords a curious though not remarkable illustration of the extent to which in Rome the ancient and the ecclesiastical are commingled. To the faithful it would appear as a fine instance of the method in which the Romish Church has consecrated to the service of God the fruitage of the heathen. The wine, they would tell us, is none the worse because idolatrous hands cultivate the grape, if pious hands have been laid upon the cup. To the Protestant it appears to afford a curious emblem of the manner in which the Church of Rome is composed of Christian doctrine and heathen rites and ceremonies. We are standing on the site occupied in the days of Paul by a temple to Juno Moneta. The unfinished church is largely composed of the remains of heathen temples. The great granite pillars which support the nave have been dug from the ruins of Rome. Every where this fact is repeated. Old walls and temples are converted into church edifices. Ruins of the past are made quarries to serve the ecclesiastical purposes of the present. Why not? Can the dead past ever do man a better service than when it becomes a quarry out of which we gather our material of ex-

STATUE OF MARCUS AURELIUS.

perience wherewith to construct for the future?

To the Catholic, however, the fact that he stands in the midst of the reconstructed ruins of classic Rome is nothing. The grand fact is that he is under the roof which covers the sacred form of the Bambino.

The Bambino is a wooden figure made to represent the infant Jesus. We are assured that it was made from a tree of the Mount of Olives, and carved by St. Luke. I hope he was a better physician than artist; for the figure itself is artistically not widely different from such as stand in inviting attitudes at the entrances of our cigar-shops—perhaps a trifle more delicate in style. It has a side chapel all to itself. It is carefully preserved in a casket of wood. Its dress is

of the finest fabrics, trimmed with lace, and it is literally covered with jewels, which are stuck all over it, as though it were a pin-cushion. For the Bambino, perhaps from its medical carver, has inherited a wonderful power. Better far in the eyes of the faithful than hydropathy, homeopathy, or allopathy is Bambino-pathy. In times of dire distress it is taken from its chapel, carried to the sick-bed, placed at the foot, and made the recipient of prayers for succor and deliverance. And such prayers are always heard. The jewels which cover its gaudy person are a part of the fees which it has received for these services. But they are only a part. The Bambino practice is wonderfully profitable to the priests—so profitable that there are several imitations in other

THE CLOACA MAXIMA.—UPPER END, NEAR THE JANUS QUADRIFRONS.

cities. But the original and genuine Bambino, the gift of the medical apostle, is to be seen only in the Church of Araceli, on the Capitoline Hill, at Rome.

On the opposite end of the Capitoline Hill stands, as we have said, the ancient temple of Rome's tutelary deity—Jupiter. On either side were temples to Juno and Minerva. On the brow of the hill, looking down into the Forum below, was a gigantic statue of Jupiter, who thus surveyed the throngs of Roman politicians in all their public gatherings. Was it intended that he should symbolize the truth that their crookedest ways and most secret and sinuous dealings were known to Him with whom we have to do? If so, his presence was a failure. For Washington is purity itself compared with ancient Rome. The corruption of the modern Church is inherited from that of the ancient Capitol. Nevertheless, Jupiter's presence was not in vain, since, if we may credit Cicero, the detection of Catiline's famous conspiracy was due to this lynx-eyed statue. Here, too, in later times stood statues representing each nation in Rome, with bells hanging from their hands. Whenever any commotion or rebellion took place in any subject nation the sensitive statue took the

alarm and rang out the warning with its bells.

Incredible? My dear Sir, nothing is incredible in Rome.

The temple itself, if we may credit the accounts of contemporaneous writers, was a marvel of architectural beauty. It is a singular circumstance—it is hardly superstitious to consider it a singular circumstance—that it was destroyed by fire in the same year in which the Temple at Jerusalem was destroyed by the Romans. It is as if God would protest that his own Temple was not destroyed by the power of the tutelary deity of the city which He selected to administer the divine judgments on the Jewish nation. In its subsequent restoration under Domitian (after a second burning) its magnificence was enhanced at the expense of true architectural taste. The age was one of display, and the gilding of the temple alone is said to have cost over \$12,000,000. If we may believe Martial, the expenses of this restoration were such as to bankrupt not merely Domitian, but even Jupiter himself. If the emperor were to call in his debts, says the poet, though the god were to put up Olympus at auction, he could not pay a shilling in the pound.

This ancient temple is now supplanted by

a remarkable museum. One of its galleries is occupied wholly by busts of ancient celebrities. A day of study here will give the visitor who is accustomed to read the enigmatical language of physiognomy a truer conception of Rome's departed heroes than many days spent in analyzing those delineations of their character which literature affords. Here is Cato, "a peevish school-boy with big ears, rigid, drawn features, and distorted cheeks, a grumbler and narrow-minded;" Aristotle, with "a full, complete head, like that of Cuvier;" Marcus Aurelius, "a noble, melancholy head, that of a man mastered by his intellect, a meditative idealist;" Demosthenes, the man of action, "the brow somewhat retreating, the eye keen as a rapier;" Terence, "an absent-minded dreamer, with low brow, small skull, and a melancholy, impoverished look;" Tiberius, "not a noble head, but well qualified to carry the affairs of an empire, and to govern a hundred million men;" Nero, looking "like an actor or a leading singer at the opera, vain and vicious, and diseased both in imagination and in intellect;" Vespasian, "a powerful man, firmly relying on well-poised faculties, ready for any emergency, circumspect, and worthy to be a renaissance pope."* Here, too, adjoining, is a gallery of pictures representing in succession every phase of art from the most spiritual to the most sensual, from Raphael to Titian. As one looks upon some of the scenes here portrayed—as one notes what pictures attract the crowds of gazers, both men and women—he wonders no longer that Rome is the most licentious of modern cities, and that traffic in vice is pursued with unblushing effrontery; and he forms a new resolve to do deadly battle to the influence of the same nefariously seductive art striving in painting and engraving in our own country to debauch American youth to the level of the Roman peasantry.

Let us return to the grand staircase; pass up its broad flight of stone steps, by the basalt lions guarding its base; by the two colossal statues of Castor and Pollux, that once adorned the theatre of Pompey, and that now crown the summit of the staircase; by the statue of Marcus Aurelius in the centre of the grand square which occupies the centre of the hill; by the *Tabularium*, which we have now no time to visit; and, turning to the right or to the left to pass around it, on the one side by a viaduct, on the other by a flight of steps, prepare to descend into the old Roman Forum.

But first we stop to look a moment upon the scene, and to conjure up the story of its wondrous past. "Soldiers," said Napoleon in the presence of the Pyramids, "forty centuries contemplate your actions." From Cap-

itoline Hill we contemplate the action of centuries long gone by, yet never to be obliterated from the memory of man so long as poetry charms and history inspires.

This scene of desolation upon which we are now looking contains probably more memorials of ancient history, and by its monuments more directly connects the past with the present and the future, than any space of ground of equal area in the known world. There is but one city whose historic associations are as interesting as those of Rome—Jerusalem. And the sacred sites in Jerusalem are involved in obscurity which there is but faint hope will ever be fully cleared away by research. Originally a marsh overflowed by the continual inundations of the Tiber, the valley between the Palatine, Capitoline, and Quirinal hills was available neither for purposes of business nor of habitation until reclaimed by human art. An embankment of massive stone-work was therefore constructed on the bank of the river, and drains of colossal size were built to carry off the stagnant water. Tradition declares that these improvements, or at least the germ of them, were made as far back as the days of Romulus. Part of the Tiber embankment and the mouth of the great sewer, the *Maxima Cloaca*, still remain.

The ground thus reclaimed from the river, lying as it did between the three chief hills of Rome, became naturally the common meeting-place of its citizens. The old Forum was an oblong space, the longer sides of which measured about two hundred yards; the shorter not far from seventy. Round this confined space were grouped the most important buildings of republican Rome—the temples of the most ancient and venerated gods, the Senate-house, the Comitium, and the Rostra. Upon it stood the statues of a legion of national heroes, and above it rose on one side the glittering temple of Capitoline Jove and the inviolate citadel, and on the other sides the mansions of the senators, or, in later times, the palaces of the emperors.

By the artist's aid the reader may stand upon the slope of Capitoline Hill and look down upon this, the most interesting spot of ancient Rome. In the foreground, upon the left, are all that remain of the once magnificent temples of Vespasian and of Saturn. Upon the right the site of the Basilica Julia is marked by recent excavations. Three solitary pillars indicate the probable location of a temple of Castor. In the distance are to be seen the Arch of Constantine and the ruin of the Coliseum. In this Forum, if we may believe the records of ancient Rome, in which myth and history are inextricably intermixed, Virginius, whose deed of doubtful heroism Macaulay has celebrated in his "Lays of Ancient Rome," slew his daughter to save her from dishonor; and from the crowd here gathered to avenge her death Appius Clau-

* The description and analysis are Taine's. See Taine's *Italy*, Am. ed., p. 114.

TEMPLE OF VESPASIAN.

dius fled to the refuge in the neighboring Mount Palatine. Here, in token of the vengeance of the gods, the earth yawned into a fearful chasm, which nothing could close till into it had been cast the most precious thing in Rome; and into it rode full armed for battle Manlius Curtius, type of the Roman hero, and the vengeance of the gods was sated, and the solid earth closed again over his tomb. Up and down the middle of this Forum, in the days of Cicero, paraded the briefless barristers waiting for a cause. If antiquity gives respectability, the peripa-

tetic advertisers who ornament our public streets are pursuing a most respectable avocation. Here stump-speaking had its birth. Hence we derive our name of rostrum, for, from wooden platforms here constructed, and decorated with the beaks of captured ships, the demagogues of ancient Rome harangued the tumultuous people. In this Forum, which, like a New England court-house, was both the site of judicial trials and of public popular gatherings, Cicero delivered those orations whose eloquence has outlived the temples of gods and the memorials of empires.

*Arch of Septimius Severus.*

THE TABULARIUM, FROM THE ROMAN FORUM.

*Ruins of Temples of Saturn, Concord, and Vespasian.**Basilica Julia.*

Here, with grand but undeserved honors, took place the funeral of Claudius, his shameless foe. Here the horrible wars of Sylla and Marius were followed with executions yet more horrible, until the Forum ran red with blood, and the people, wearied with internecine strife, were ready to accept the comparative peace and prosperity which the empire afforded. Here Cæsar fell, victor of many battles, to be at last the victim of assassins; and this is the scene of that grand funeral occasion which Shakspeare has con-

verted into a drama more true, because more life-like, than history itself. Up the *Sacra Via* passed those magnificent triumphal processions which characterized the reign of the emperors, and marked by their ostentation and display the decay and approaching dissolution of Rome: for he who devotes to celebrating exploits those energies which should be devoted to performing them has already ceased to be great; and this is as true of nations as of individuals. Surrounded by the temples upon whose ruins we are

TRAJAN'S COLUMN, WITH THE BASES OF THE COLUMNS OF THE BASILICA ULPIA AND THE CHURCH OF
NOME DI MARIA.

The rising ground on the right is a part of the Quirinal Hill.

looking, or within their walls, took place the trial of the primitive Christians, whose only offense against good morals was that they refused to participate in a religion which Rome's wisest philosophers, with unanimous voice, pronounced a fraud; and thus in imperial Rome grew up that spirit of persecution which the Christian Church failed to exorcise, but which, driven from the city for a season, returned to ecclesiastical Rome in sevenfold force, like the devil in the parable.

Let us take a writer's privilege, and, by an aerial flight, place ourselves at the opposite

end of the ancient Forum. We have before been looking down upon the Forum. Now we reverse our position. We have been looking from the Tabularium; now we look toward it.

The débris of centuries has accumulated here. To reach the ancient pavement it is necessary to dig five, ten, fifteen feet below the level of the present city. The modern viaduct along which the traveler now descends is raised, as the reader will perceive, considerably above the ancient pavement, which is only in places exposed to

BASE OF TRAJAN'S COLUMN.

view by recent excavations. In the foreground, on our left, is so much of the foundation of the Basilica Julia as is now uncovered, while the mound of earth upon the right indicates the nature and the depth of the deposit of rubbish which has to be removed. The arch upon the right is that of Septimius Severus; the pillars upon the left, what remains of the temples of Saturn, Concord, and Vespasian; while the great building in the centre, at the rear, is the Tabularium. The ancient walls and arches may still be seen in the foundation of the new building, which is built upon the ruins of the old. The tower belongs to one of the palaces upon the Capitoline Hill. The group of buildings upon the extreme right is a part of another of these palaces.

Resuming our original station, and descending more leisurely the viaduct which leads from the hill to the Forum, we will visit and study a little more in detail some

of the objects of more special historic interest.

We pass down the hill by the elevated roadway seen in the engraving, leaving to our left the ruins of the temples of Saturn and Vespasian. Of both but a few columns are left standing. The identity of the latter, built by Domitian, A.D. 94, in honor of the emperor for whom it was named, is uncertain, and the columns which are supposed to mark its site are chiefly interesting as an illustration of the mutability of that human greatness which depends upon material memorials for perpetuating its renown. Born about the same time as the apostle Paul, living in the same era, and possessing the highest position to which the ambition of man could then aspire, the temple erected to his honor has fallen into such irretrievable ruin that even its identity is a matter of conjecture; while the letters of his contemporary, written with no thought of future renown,

with probably no expectation of their permanent existence, are multiplied in myriad copies, and engraven imperishably upon myriad hearts. A yet more striking illustration of the perishable nature of all such material monuments will be presently afforded us as we walk down the Forum. For we shall pass by the site once occupied by an equestrian statue of Domitian, of which all that is known is the description of it afforded by Dion Cassius, who prophesies that time will be unable to injure so noble a statue, and that it will outlast the Eternal

City itself. Alas for the prophet! No vestige of the horse or its imperial rider remains.

Upon our left is the excavation which marks the site of the Basilica Julia. These basilicæ, though in name Greek, were in character Roman. They afforded at once a place for mercantile exchange and for the courts of law. They were sometimes very considerable in size, the Basilica Julia being more than three hundred feet in length and over sixty feet in breadth. But they were neither very ornamental nor, despite a

SHOPS IN TRAJAN'S FORUM.

TEMPLE OF ANTONINUS AND FAUSTINA.

certain architectural display, would they be accepted in our age as very convenient, since they rarely had a central roof, and were often without side walls. These skeleton edifices, thus composed often merely of rows of pillars, became the architectural model of the Christian church, and it is said that the Basilica of St. Peter was itself constructed by the Emperor Constantine in the first half of the fourth century. Passing the Arch of Septimius Severus and the site of the ancient Temple of Concord, we pause one moment to conjure up the scene when, from the steps of this temple, to the excited crowd thronging the Forum, Cicero delivered his third oration against Catiline. Then, leaving the Forum Romanum for the present, we pass through crooked streets to the site not far distant of Trajan's Forum.

Trajan's Forum marks, in some respects, an era in Roman history; for under Trajan and his successor, Hadrian, the rage for

building reached its height. His Forum, for which a space was cleared between the Quirinal and the Capitoline hills nearly equal to the area of the other imperial fora in Rome, was long one of the wonders of the world. Here stood his equestrian statue, which gave rise to the oft-repeated story of the Emperor Constantius. Visiting Rome, he expressed his astonishment at the magnificence of the city, and his despair of ever being able to rival the colossal structures of Trajan, adding that the only thing which he would dare to attempt to imitate was the equestrian statue. Thereupon an attending prince replied, "Your majesty must first build, if you can, a stable like this in which to stall the horse you propose to make, if he is to be properly lodged." Not only Italy itself, but the provinces of the remotest West and East, were, during this era, covered with huge engineering undertakings—engineering rather than architectural: aqueducts,

bridges, viaducts, amphitheatres, and basilicæ.

Of all these varied works—indeed, of all the monuments of Rome or even Italy—Trajan's Column, still standing comparatively intact, majestic in the midst of ruins, is one of the most interesting and instructive. Originally it was hedged in with public buildings, the upper part alone being visible from the square. It appears to have been the intention of the architect, not that the column should be viewed, as we now view it, as a whole, but that the colossal statue of the emperor should be raised on high far above his splendid group of buildings. But he stands there no longer. Carried off during the robberies committed at Rome by the Byzantine emperors, A.D. 663, his statue was replaced by Sixtus V. with a statue of St. Peter, who from this lofty eminence surveys the city which, until so recently, his supposed successors ruled.

That which gives to this column its peculiar celebrity, however, is the magnificent wreath of bass-reliefs which winds around the shaft, and contains the history of two campaigns against the Dacians. The story of these campaigns is told with wonderful skill. There are said to be more than five hundred sculptured figures of men upon the column, and the higher they are placed the larger are their dimensions, that the effects of the increased distance may be counteracted. The whole carving, from base to summit, is executed with equally minute care. Bridges being constructed, Roman causeways laid, forts attacked with all kinds of

military engines, the charge of cavalry, the rout and confusion of a defeated army, are all most vividly depicted. Trajan in person traverses the ranks on foot, or mounts a temporary platform and harangues his men, or receives with simple dignity the submission of the enemy, or marches with all the pomp of a Roman procession under the triumphal arch. The soldier-like simplicity and *bonhomie* of the great military emperor are strikingly portrayed. There is no silken tent, or richly decorated chariot, or throne, or canopy of state to be seen. His colonel of the guards sits beside him as an equal. In the midst of a battle the emperor tears up his robe to bind the wounds of his soldiers. He is present every where, wearing a sword and fighting in person. Nothing could be more illustrative of the state of Roman affairs in that iron age, when, as in the olden times, rough and unlettered warriors, fresh from the camp, swayed the destinies of the empire. The descriptions of Livy and Polybius, Cæsar and Tacitus, receive life and movement and interest as we look at the actual figures here sculptured—the Pretorian Guards, marked by their belts over the left shoulder; the fierce-looking standard-bearers and centurions, with their heads covered with wolves' skins, and the shaggy manes of lions streaming down their backs; the rank and file, carrying enormous stakes; the master-masons, sappers, and pioneers, with their axes and crow-bars; the lancers, the heavy and light cavalry, and the royal chargers; the Sarmatian horsemen, clothed, riders and steeds, in complete scale-

BASILICA OF CONSTANTINE.

ARCH OF TITUS.

armor; and the Moorish cavalry, riding without reins. But this study can not be pursued to advantage at the column itself. The buildings whose galleries formerly afforded a good view of the column are now destroyed, and the history which Trajan's architect designed to preserve must now be read from the models and engravings in the museums.

A certain mournful interest attaches to this scene of ruined splendor in the story it recalls of the fate of the architect who planned and directed the original construction, Apollodorus by name. Hadrian, having designed a temple for Venus and Roma, sent his design to the famous architect of his predecessor's public buildings, nominally for

criticism, really for applause. But Apollodorus was a better artist than courtier. He sent back word that if the colossal statues of the goddesses—which Hadrian had placed in a sitting position—wished to stand up, they would not find their house high enough. The enraged emperor was the more incensed because the caustic criticism was so just, and the unfortunate architect paid the penalty of his candor with his life.

Almost as significant as Trajan's Column are the ruins of Trajan's shops. If the one attests the splendor of his monuments and public edifices, the other equally attests that there was no commensurate regard to comfort in private edifices. A brick building two stories high, the first containing small

ARCH OF TITUS.—TRIUMPHAL CAR AND PROCESSION.

rooms about ten feet square, the offices and shops of notaries and clerks; the second, built not upon the first, but upon the hill behind, and constituting their dwelling-houses—such were the shops of Rome, if we may judge from their dismantled ruins. And this was the Broadway and the Fifth Avenue of an age which produced a Trajan's Column and a Hadrian's Mausoleum.

Returning to the Roman Forum, and re-passing again the Arch of Septimius Severus, we stand before the Column of Phocas. But not long; for there is little in the column, and nothing in the memories it awakens to

arouse our interest. Erected by a cringing courtier to a brutal emperor, it obtrudes itself on the sacred ground of the Roman Forum, while the statues and memorials of heroes, whose names are well worthy of being perpetuated, are destroyed by the combined ravages of time and Vandalism. Passing along the side of the Basilica Julia, by the three columns which remain to mark the site of the Temple of Castor, we reach the site of the rostra erected by Julius Cæsar at the southeastern end of the Forum. The old rostra were at the other end of the Forum. By separating them from their former con-

nection with the Senate, Cæsar indicated that the appeal must henceforth be made not to a privileged class, but to the masses. For ancient, like modern, Cæsarism pretended to be based upon the will of the people. Directly opposite, and upon our left hand, are the remains of the Temple of Antoninus and Faustina, dedicated by Antoninus to his wife, A.D. 141, and re-dedicated after the emperor's death to Antoninus himself. The change which has been wrought in the surface of Rome by the accumulations of débris received a striking illustration at this point. Originally it stood at some height above the level of the Forum. The entrance is now sixteen feet below the surface. Within this ruined temple a Roman Catholic church has been constructed. Thus the edifice erected by the emperor who was one of the brightest lights and most earnest advocates of heathenism, and under whose reign a bitter persecution of the Christians took place, has been, we might almost say, miraculously preserved amidst ruined temples, whose site is only marked by isolated columns, that, consecrated to the worship of Christ, it may testify how puerile are the efforts of the strongest and the wisest to withstand the progress of Christianity.

Almost equally significant is the fact that the Forum and Temple of Peace, built by Vespasian after the conquest of Jerusalem

to celebrate his triumph, has undergone such complete obliteration that even the exact site of it remains in uncertainty. It was somewhere between the Temple of Antoninus and the Basilica of Constantine, which, however, we do not stop long to examine; for just before us is the object which perhaps of all others in Rome possesses the greatest interest to the Christian: it is the Arch of Titus.

It was the custom in ancient Rome to award to any conqueror returning after a signal victory a triumphal procession. He entered the city bearing the trophies of his victory with him. Triumphal arches, sometimes temporary in their character, sometimes more durable, were constructed, beneath which the procession marched, and which sometimes remained as a memorial. The Arch of Titus was erected to celebrate his victory over the Jews in the capture and destruction of Jerusalem, and contains upon the interior a magnificent alto-relievo representing the triumphal procession. Upon the one side the emperor is represented in his triumphal car, drawn by four horses, and surrounded by his guards and suit; while upon the other are portrayed a number of persons carrying the spoils of the Jewish Temple in triumph. It affords the only definite representation we have of the sacred vessels described in the Scriptures, and is

THE COLISEUM, FROM THE PALATINE HILL.

On the left is the top of the Arch of Titus and the ruins of the Temple of Venus and Roma, with the Meta Sudans; on the right the Lateran Palace and Basilica; and in the background the hills of Tusculum on the right, and of Præneste on the left.

invaluable as a historic testimony to the truthfulness in the minutest details of the biblical descriptions of the Temple furniture.

During our walk down the Forum the ruins of the Coliseum have been most of the time in view, and toward them we have been steadily though slowly approaching. Leaving Palatine Hill, formerly covered all over with imperial palaces, behind us, we stand at last before what is the grandest ruin in this city of ruins, and architecturally the greatest curiosity in what M. Taine has well called "a grand old curiosity shop." Since no one obtains from a single visit to the Coliseum any adequate conception of its past or even present grandeur, it can not be expected that either the pen of the writer or the pencil of the artist will be otherwise than inadequate to portray it. For centuries piece after piece has been carried away, first by noble, then by priestly, and finally by itinerant robbers. Whole palaces have been constructed of its materials. It has served the purpose of a private castle, of a hospital, of a saltpetre manufactory, and of a miscellaneous quarry. Two-thirds at least of the original structure have disappeared under this long process of Vandalism, and yet it is estimated that the present value of the ruins which still remain is not less than two and a half millions of dollars. It is now consecrated to the memory of the martyrs whose blood was formerly shed within its arena.

Grand as these ruins are—grandest of all seen on a moonlight night—they afford but an imperfect hint of the stupendous character of what was unquestionably, in its prime, the grandest edifice ever erected for purposes of public entertainment. Let the reader conjure up, if he can, six acres of ground inclosed in an elliptical building 564 feet in length and 467 in breadth, the slopes of the vast concave surrounded with sixty to eighty rows of marble seats, from which 80,000 spectators look down upon the scene below. And what a scene! In comparison with the effects here wrought the most perfect scenic changes of the modern theatre sink into insignificance. To-day the arena is filled with a spacious and shady forest transplanted from neighboring hills. Beneath their shade are gathered ostriches, stags, fallow deer, wild boars, lions, leopards, bears, counted by the hundreds, and pursued in mimic chase for the amusement of the throng. To-morrow the forest is removed, and the smooth floor of the arena is prepared for some gladiatorial combat. Anon, by subterranean pipes, the level plain is converted into a wide lake, covered with armed vessels, and filled with monsters of the deep. The sublimest building in Rome was also the unmistakable monument to its degradation and decay. When Rome was no longer brave to do battle for humanity, or even for itself, it gathered here to gloat over intolerable cruelties, and

to glory in massacres of unoffending Christians, or of inoffensive beasts.

The tourist will find in the Eternal City a guide-book entitled "Rome in Eight Days." When one has spent eight days in Rome he begins to realize how ludicrous is such a title. To keep pace with the explorations and archæological discoveries continually in progress there will of itself suffice to absorb all one's attention; and if in the few pages allotted to us we had attempted to give the reader any thing like an account of the entire city, we should have left him in ignorance of the whole of it. Under our guidance he has visited only the heart of ancient Rome, and looked superficially upon a few of the more important objects of interest grouped about the ancient Forum.

AN AUTUMN MEMORY.

THE leaves of the maple are crimson and gold,
As here to-day in its shade I lie;
And the pearly peaks of the clouds, uprolled,
Loom up like castles within the sky.

Afar in the distance the purple hills
Are wrapped in a veil of slender mist,
That over the landscape the wide air fills
With the tint of the tenderest amethyst.

The golden reed on the hill-side grows,
Nodding its head to the winds that blow,
And the flame of the gaudy sunflower glows
In the farm-yards down in the vale below.

There the river glides on its winding way,
By fields that are crowned with the ripened corn,
Whose broad leaves shine in the sun to-day
Like the flaming banners that gild the morn.

And my thoughts, like a tide that leaves the shore
To wander out toward the open sea,
Turn back to an autumn gone before
In the golden days that were dear to me.

The maple's leaves have the same rich glow,
The same clouds float through the azure sky,
The same waves flow, and the same winds blow,
On this autumn day as in years gone by.

I can see no changes, save those in me,
Since the time when we floated down yonder stream.
Oh! I wish that the past again might be,
Which at present seems but a beautiful dream,

When we floated along on yon river's breast,
Down past the woods that are flushed with gold,
Till the sunset burned in the reddening west,
And deepened to twilight, purple and cold.

I, with a hand on each listless oar,
Just guiding our course round each silvery bend;
While alone in the stern sat Eleanor—
Can you paint me the picture, my artist friend?

With sometimes a song on those lips so rare—
The song you can't paint, I know full well—
But the exquisite face, and the falling hair,
And the love in the eyes I would have you tell.

I would have you paint well the graceful head,
And the girlish form in its crimson shawl.
Did you ask me just now if she were dead?
No; years bring changes, my friend; that's all.

Adown Life's river in daylight and dark,
Through shadow and sunshine, we're floating now;
But each of us sails in a different bark,
With different angels to guide the prow.

THE HAUNTED LAKE.

J. Fenimore Cooper

UP in the hill country of New York, far from cities, sequestered in its little valley, fed by crystal springs in its secret depths, lies the Haunted Lake—smiling, sparkling, shimmering, shining, under the clear heaven, all by itself, as fair and pure as on the radiant morning of creation's first day. In the low countries round about on every side the hills are gathering together. First a gentle swell rolls over the even surface of the green meadow, and the grain fields climb ambitiously over the rounded hills, raising their smooth heads here and there; then comes a bolder ascent, with sunny pastures stretching up its sides, ending in unfenced woodland, and the edge of rockyspurs thrown out from stony ledges, where, piled one upon another, the crags and cliffs rise higher and higher, until they reach the outlying flanks of the mountains which stand around the Haunted Lake—fair Mount Vision at the foot, turning her back upon old Crumborn down the valley, and at the head the Sleeping Lion majestically guarding the northern

pass. The trees sweep down the eastern side in almost unbroken columns, beeches and maples crowding together near the water, while higher up the dark pines close over the carpeted aisles below, and whisper from tree to tree their secret messages, until the old patriarchs standing against the sky on the mountain-top catch the low murmurs, and, shaking their heads mysteriously, sigh to each other in the passing breeze. In among their twisted roots grow the variegated mosses and the trailing arbutus, often wet with the silver spray of some little spring gently creeping along, and dropping timidly from rock to rock, until, with growing confidence, it bounds over the cliff, and goes dancing and frolicking down the mountain-side into the lake below, where wave the green rushes, and where float the great water-lilies with their golden crowns.

At the foot of Mount Vision a little river leaves the lake, and steals away under shady banks, gently and unobtrusively rippling along between the broad meadows, and grad-

ually gathering strength from every hill-side brook as it rolls onward toward the south, through the rich farm lands, by crowded cities, over the boundary lines of great States, and across the feet of cloud-capped mountains, until, its journey ended, the mighty Susquehanna, born in the Haunted Lake, five hundred miles away, meets the salt-water where the ocean thrusts up into the land the long arm of Chesapeake Bay. But, although the river flows through a succession of lovely valleys, there is in all its course no scene so charming as its source—"Susquehanna's utmost spring," as the old song has it. The little lake, in its secluded beauty, has escaped the prosaic touch of modern improvement, and, with the exception of one or two old-fashioned farms slumbering on the western hill-side, the shores are wild and wooded, the Sleeping Lion at the head being covered with as dense a forest as the first pioneer beheld a century and a half ago. Happily forgotten in its hiding-place among the mountains, the Haunted Lake is consecrated to memories of the past. The air is filled with an unseen presence, and a spirit moves upon the face of the deep. A master mind has hallowed the scene; and as we linger on the pebbly beach the echoes seem to repeat his name over our heads, and the waters to murmur it at our feet—a name familiar to many nations and languages, but nowhere so appropriately honored or so affectionately recalled as upon the shores of Otsego Lake.

James Fenimore Cooper is dead, but the characters he created still live; and as the New World grows old they will brighten into fresher life, faithful and almost solitary representations of the primitive days of our country, and more and more prized as the progress of time rolls back the dust of obscurity over the past. The author has left us, but the magic of his genius lingers around the lake he so lovingly described. Its points and bays are haunted, and its forests are peopled with wraiths and shades. A listener under the trees on a dreamy summer day will hear the low musical laugh of Wah-tawah, the gentle Indian maiden, and catch a glimpse of the young chieftain, her lover, in the distance through the forest arches. Sometimes, at dusk, the camp fires of the Iroquois gleam from the gravelly points of the eastern shore; and off Hyde Bay, where the rushes wave on the shoal, the dim outline of Muskrat Castle can be traced; and the faint strains of an old-time hymn are heard strangely sweet over the water—the even-song of innocent Hetty at her mother's grave. On a moonlight night the solitary oarsman is startled by the flapping of unseen canvas, and, silently appearing from the realms of nowhere, the Ark glides slowly into view, old Hutter at the helm, and the gigantic form of Harry Hurry lounging in the door-way. Attempt to approach the spirit bark, and it vanishes in the haze, with a stentorian laugh from Harry Hurry ringing over the water, and echoed back and

COOPERSTOWN.

MRS. WILLIAM COOPER, MOTHER OF JAMES FENIMORE COOPER.

forth from mountain to mountain until the whole group around the Haunted Lake seem nodding and shaking their sides in weird merriment.

But, dearer than all in his gentle simplicity, honest-hearted Natty, the greatest creation of Cooper's pen, haunts the lake and woods around, hunting the deer with dog and gun, the kindest spirit of the band. Sometimes, as the Deerslayer, he is seen near the Fairy Spring, his grave youthful face unmoved by the beauty of Judith Hutter, that alluring Lady of the Lake, whose dark eyes fascinate us even from the written page, and make us wonder at the severity of this forest Galahad. Then as Leatherstocking, the mighty hunter, advanced in years, but honest-hearted still, he is sometimes visible coming down from the cave that bears his name, gliding in his canoe across Blackbird Bay, or crossing the Vision in haste to rescue from the panther's cruel claws the fair form of Elizabeth Temple. The distant prairie, where the Leatherstocking finally disappears from our sight, is torn up by the steam-plow and locomotive; the old trapper, with his white hairs and trembling steps, has returned to the Haunted Lake; and at early dawn his bowed figure appears at rare intervals standing on Otsego Rock shading his eyes from the rising sun, and gazing over the Glimmerglass, the scene of his youthful exploits, with earnest inter-

est. Dear old Natty, faithful, kindly wraith, the memory of thy character and deeds will haunt the valley long after the very names of its real men and women are forgotten—save only the name of the man who gave thee to the world, the man whose grave is fitly made near the shores of the Haunted Lake.

O Haunted Lake, from out whose silver fountains
The mighty Susquehanna takes its rise;
O Haunted Lake, among the pine-clad mountains,
Forever smiling upward to the skies—

Thrice blest art thou in every curling wavelet,
In every floating water-lily sweet,
From the old Lion at thy northern boundary
To fair Mount Vision sleeping at thy feet.

A master's hand hath painted all thy beauties,
A master's mind hath peopled all thy shore
With wraiths of mighty hunters and fair maidens
Haunting thy forest glades for evermore.

A master's heart hath gilded all thy valley
With golden splendor from a loving breast;
And in thy little church-yard 'neath the pine-trees
A master's body sleeps in quiet rest.

O Haunted Lake, guard well thy sacred story,
Guard well the memory of that honored name,
Guard well the Grave that gives thee all thy glory,
And raises thee to long-enduring fame.

James Fenimore Cooper was born in Burlington, New Jersey, September 15, 1789. Brought in early childhood to the source of the Susquehanna, where the manor-house, with a few log-buildings around it, stood in a little clearing on the lake shore, his first

impressions of life and the world were derived from the unbroken forests, the rude homes of the settlers, the hunters and trappers who roamed through the wilderness in lawless freedom, and the scattered remnants of once powerful Indian tribes that still lingered around Lake Otsego. An impulsive, healthy boy, he enjoyed the companionship of the various odd characters who belong only to the early phases of pioneer life, learning from them to hunt, sail, and fish, and detecting their peculiarities with that keen observation which is an invariable characteristic of the ready writer. Those authors who write from within, and coin their own brains into words, may go dreamily through the world, their eyes fixed upon vacancy, and depending upon some patient household fairy to guide their stumbling steps; but the man who takes mankind for his subject, the man who writes to benefit and interest his race, is quick-witted and sharp-sighted, drawing upon his own observations of every-day life rather than the dusty tomes of antiquity. Thus Mr. Cooper's most brilliant tales are founded upon two phases of actual experience—his boyhood in the little settlement on Otsego Lake, and his six years at sea, part of the time a sailor before the mast. From his own memory he reproduced those scenes of frontier life which even now seem remote and strange, possessing, as they do, a peculiar charm, which many have felt without under-

LEATHERSTOCKING FALLS.

standing that the secret lies in their literal truth—far more fascinating, could we but know it, than the wildest flights of fancy.

Having spent three years at Yale College, young Cooper went to sea, and, after making two voyages to England and Spain, entered the navy as midshipman, and soon attained a lieutenantancy. From these years of sailor life he drew all the sea-stories which have rendered his name famous, and given him the highest place among nautical writers, notwithstanding many imitators and successors. He delighted in the beauty of a fine ship as a lover delights in the beauty of his mistress,

and in his descriptions he mingled a warm enthusiasm with a practical knowledge of the subject. Each rope and sail were familiar to his hand, and his pages exhale the genuine odor of the salt-water as the vessel glides over the white-caps, a real ship and a real ocean, although bound in the covers of a book. Resigning his position in the navy, Mr. Cooper, at the age of twenty-two, married Miss Susan De Lan-

LEATHERSTOCKING CAVE.

COOPER'S LIBRARY IN OTSEGO HALL.*

cey, sister of the Bishop of Western New York; and now that twenty years have passed since the graves of husband and wife were made in the little church-yard under the pines, comment may be permitted, and with the more freedom since, sooner or later, the lives of eminent men must necessarily become the property of the public. Among the sad heart-histories which the biographies of men of genius are almost sure to reveal, the charming love-story of Fenimore Cooper and his wife shines out with pure radiance, an ideal picture of a happy marriage. A lovely, accomplished woman, Mrs. Cooper was blessed with the unchanging, tender devotion of her husband through forty long years; and even in death they were not separated, for within four months after the husband's departure his gentle wife followed him, a fit resident for that heaven for which her whole life had been one constant preparation. Mrs. Cooper was retiring and feminine in every movement, word, and action. Her strong, impetuous husband—massive and vigorous in frame, decided and independent in action—yielded to her a chivalrous devotion most beautiful and rare. She was his preferred companion above all others, and in his daily drives to his mountain farm, called the Chalet, he always want-

ed her by his side, while in the evening his favorite amusement was a game of chess with his wife as antagonist. Although children grew up around them, although the hospitable mansion was often filled with distinguished and delightful guests, although time passed and they grew old, the husband and wife never sank into the mere father and mother, but to the last they cherished for each other that fresh affection which is so seldom seen after the bloom of youth and the charm of novelty have passed away. The fair, gentle women who hover over Cooper's pages were patterned after his beloved wife, who, happily occupied in her own quiet sphere, was content to follow the old-fashioned rule of the Bible, that "the husband is the head of the wife, even as Christ is the head of the Church, in every thing."

After his marriage Mr. Cooper lived for some time at Scarsdale, in Westchester County, and here he wrote his first story, "Precaution," a tale of English life. He was reading an English novel aloud to his wife, when suddenly he threw down the book and exclaimed, "I believe I could write a better myself." Following the impulse, he immediately composed a few chapters and read them to Mrs. Cooper, who encouraged him in the work, and urged him to publish it when completed, although at this time he had no intention of appearing before the public. The manuscript, however, was at length submitted to the late Charles Wilkes,

* We are indebted to G. Pomeroy Keese, Esq., for the sketch of Cooper's Library from which the engraving on this page has been made. No illustration of this library has ever been published.—ED. HARPER.

OTSEGO HALL.

and meeting with his approval, was published in 1820, winning favorable notice both in this country and England, and showing germs of that genius which, when employed upon a more congenial and original subject, gained for the author such triumphant success. In 1821 Mr. Cooper published the "Spy," which was immediately and brilliantly successful, being the first spirited story of our Revolutionary war, and thus opening a new era in American literature. The "Spy" has been translated into all the languages of Europe, and even crossed the borders into Asia, a

Persian version having appeared in 1847 at Ispahan.

From 1821 until his death, a period of thirty years, Mr. Cooper published no less than thirty-nine volumes, thirty-two being novels—an amount of mental and physical labor which justly entitles him to be called a hard-working man; for although he sometimes employed his daughters as amanuenses, still the work of composing and preparing even one book for the press is arduous, as any doubter will find if he tries it. During this time he resided for eight years in New

ENTRANCE-GATE TO OTSEGO HALL.

CHRIST CHURCH, COOPERSTOWN.

York city, a favorite member of the literary society there gathered, numbering in its circle such men as Washington Irving, Bryant, Halleck, Bancroft, Gaylord Clarke, George P. Morris, Parke Godwin, N. P. Willis, Chancellor Kent the jurist, Jarvis the painter, Verplanck, and Morse the inventor of the telegraph. After this Mr. Cooper sailed with his family for Europe, spending seven years abroad; but amidst all the pleasures and excitements of foreign travel his industry never relaxed; and during this period he wrote no less than nine volumes, among them the "Red Rover" and the "Water Witch," two brilliant sea-stories; the "Bravo," which gained a high reputation abroad; and that powerful picture of border life called the "Prairie," the last in the Leatherstocking series. Returning to America in 1833, he made his permanent home in Cooperstown, where, with occasional visits to New York, he spent the remainder of his life in the old manor-house known as the Hall, built by his father, Judge Cooper, in 1796, and improved and altered into one of the most charming and comfortable old-fashioned houses in the country.

In the seventeen years of his residence at Cooperstown Mr. Cooper published twenty-four volumes, among them the "Pathfinder," the "Deerslayer," and "Wing and Wing." In the two first named the youthful life of Leatherstocking is described, and his peculiar character carefully developed with skillful touches, until he stands forth in clear proportions, the most original creation in Amer-

ican literature. In the "Deerslayer" the scene is laid on Otsego Lake, and the lovely story has thrown a fascination over the blue waters which will last for centuries. It stands alone among its companion volumes, a charming idyl of the woods, partaking of the essence of Hawthorne's legends, the most romantic and mysterious of all Cooper's productions, which generally deal with the broad light of practical reality. Returning one morning from the Chalet farm accompanied by his daughter, Mr. Cooper checked his horse and gazed long and earnestly upon the lake spread out beneath. At length he exclaimed, "I must write one more story about our beautiful lake, Susie;" and urging the horse forward, he hastened home, and, retiring immediately to his library, began the "Deerslayer." At the time of his death he was meditating still another addition to the Leatherstocking series; and no doubt the character of Natty could well bear it, judging from the power of the "Deerslayer," which, though the first of the series, was written last; but death

came, and the busy brain was stilled.

"Wing and Wing" is a prose poem of the sea; the necessary *dramatis personæ* are present, but the interest centres around the graceful little *Feu-Follet*, a very fairy vessel, coming down wing and wing before the lightest zephyr, and driving the baffled Englishmen wild with its mysterious speed. Although not so widely known as the "Pilot," it is a peculiarly charming sea-story.

An extended criticism of Cooper's works is not necessary, since his place has long ago been awarded. When he began writing he stood almost alone where now an innumerable crowd are contesting every inch of vantage-ground; and although his style has its defects, his novels are powerful and interesting in themselves, besides presenting valuable pictures of the infancy of our country, the life of the pioneer, the characteristics of the Indians, and the struggle for national liberty both on land and sea. All public libraries are obliged to provide themselves with numerous copies of his works, and no private library is considered complete without a costly edition. As an evidence of his popularity abroad, it may be mentioned that in Holland alone there are three different translations of his novels into three different dialects of the country.

In all the long list, also, there is not one word "which, dying, he could wish erased." And this, be it remembered, is said of books which have not a trace of that dull, "goody" character which is generally associated with

COOPER'S CHALET FARM-HOUSE.

the quoted phrase : Mr. Cooper's novels were, like himself, manly and earnest, but although he was truly religious, he was not dull—a rare separation between two words so often united that they are almost synonymous.

In recalling the number of volumes that the author's pen produced it might naturally be supposed that his whole time was devoted to writing; but, instead of this, he had many other occupations. Rising early in the morning, he generally accomplished all his writing before breakfast, which took place at nine, devoting the hours in the middle of the day to his mountain farm, the Chalet, where he found out-door recreation in an obstinate contest with the stony soil, he being determined that the crops should grow, and the mountain being determined that they should not: it is said that the mountain won the day, since, during all the years of the contest, the farm only paid its expenses once! The relaxation obtained in this way, however, was heartily enjoyed by Mr. Cooper; and no doubt this constant communion with nature and this vigorous open-air exercise contributed to preserve the healthy, manly tone so conspicuous in his writings. Your morbid, unnatural authors are generally hot-house dyspeptics.

The library at the Hall—Mr. Cooper's favorite retreat—was a large room wainscoted in oak, with a southwestern exposure. Here were gathered a fine collection of books, souvenirs of travel, a large number of auto-

graphs and notes from distinguished foreigners, as well as the author's writing-table of walnut—an ancient heir-loom brought from the East, and called "Rancocus," from a creek on the New Jersey farm. In this room Mr. Cooper read and wrote; but when any thing amused him he would seek the hall—which was used as a sitting-room, and gave the name to the house—and read the passage aloud; for he was of a social nature, and in all that he did he loved to have his family with him. Late in the afternoon he would begin walking up and down the hall with his hands behind him, apparently thinking out his next chapters, and now and then nodding his head emphatically at the successful completion of some silent train of thought; so that, no doubt, this twilight hour was the real working-time of the day, when the brain drew the outlines which the hand was to fill out the next morning. Thus engaged from year to year, surrounded by an affectionate family, an active member of the Episcopal Church, Mr. Cooper spent the last years of his life, and when within one day of his sixty-second birthday, near the fatal epoch called the grand climacteric, in the full possession of all his mental powers, and firmly trusting in the mercy of his Saviour, he passed peacefully from earth. Death was robbed of its traditional terrors, and many felt, "Let my last end be like his!"

His body was laid in the old family inclosure in the church-yard; his wife is by his

THE COOPER BURYING-GROUND.

side; and a plain slab of Italian marble, containing merely their names, marks the spot. The church-yard is peculiarly beautiful, with its ancient pine-trees and broad path leading up to the church, where Mr. Cooper was so long a warden and devout worshiper; two fine memorial windows in the south transept were inserted by the children in memory of their father and mother.

The Cooper burying-ground, an inclosure by itself, is filled with graves, including all ages, from Judge Cooper, the founder of the village, who died in 1809, to young Marmaduke Cooper, Lieutenant Third New York Volunteers, who died in hospital in Virginia in 1863, and was brought home to sleep with his kindred. As Mr. Cooper's only son resides in Albany, the next generation may see the name extinct in Cooperstown, and the last grave added to the family circle in the church-yard under the pines.

On one of the slopes of Mount Vision, just beyond the site of the panther scene in the "Pioneers," stands the Cooper Monument, in the grounds of the new cemetery. It is of Italian marble, twenty-five feet high, with a figure of Leatherstocking, four and a half feet high, on the summit. Natty is represented loading his rifle and gazing off on the Glimmerglass spread out beneath him, while the hound by his side, watching his master with eager eyes, betrays the accomplished hand of Launitz in his life-like fidelity: alas, that the hand has grown cold! The die is

carved with symbols in alto-relievo: on one side is the name of Fenimore Cooper, surrounded by palm and oak branches; and on the opposite face is seen the student's lamp and inkstand, with the pen borne aloft by an eagle. On the north side are the naval emblems, an anchor with crossed oars, spy-glass, and commander's sword; and on the south the Indian devices, bow and quiver of arrows, scalp locks on a lance, tomahawk, and necklace of bears' claws. Much has been said as to the propriety of placing Cooper's monument on any other site than Cooper's grave, especially when so short a distance separates them; and truly the natural place would seem to be the spot where the author's body lies. But when we inspect the marble column, with Natty standing on its summit, our thoughts turn first to the honest-hearted old hunter, who is as much a friend as though he really lived and died in the flesh, and it seems right that some memorial to his memory should stand on the hill-side where he roamed, overlooking the lake which he loved. Let Natty, therefore, have the marble column, and let Cooper sleep with his kindred in the old church-yard, needing no sculptured monument to mark the pathway to his grave, deeply worn by hundreds of pilgrim feet year after year.

The Cooper manor-house, known as the Hall, was burned down in 1853; the grounds having passed out of the hands of the family, are allowed to remain in a deplorable

COOPER'S MONUMENT.

owns, the Cooper lot is by far the most precious, being literally classic ground. One would suppose that the villagers might combine to purchase the spot from its unappreciative owner, and lay it out as a park, in this way honoring the memory of the man to whose genius they owe all that raises their village above the common herd of country towns; but instead of this, the Vandalism is soon to be completed by running a street directly through the garden, thus converting the cherished homestead of the author into a common thoroughfare, and sweeping away all those associations which should be the richest treasure of the town.

On the banks of the Susquehanna stands a picturesque cottage built of the bricks gathered from the ruins of the Hall; this quiet retreat is the abode of three daughters of Mr. Cooper, among whom is Miss Susan Fenimore Cooper, the author of "Rural Hours" — a book which by its exquisite truthful descriptions has endeared her name to all real lovers of nature. Here, with many of the treasures from their old home, the Hall, around them, these accomplished ladies, whose youth was passed among the gayeties and charms of foreign life, spend their time, every locality being dear with associations of their beloved father. Active and generous, they devote themselves to various good works,

condition, the old stone wall crumbling away, the paths obstructed, and the garden obliterated in a growth of straggling underbrush, where a colony of old horses and cows wander at will. The lot is part of the possessions of the largest land-owner in the State of New York—a most eccentric character—who, although a gentleman by birth and education, prides himself upon his dilapidated clothes, his especial delights being a yellow cloak gathered in the back and reaching to his heels, and an umbrella which must be seen to be appreciated. In all the thousands of acres which this odd genius

and several of the charitable institutions of the county owe to them their existence, among others a hospital, and more recently an orphanage, which deserves the hearty support of all liberal hearts.

Cooperstown itself is a pretty village, with some handsome residences, a fine hotel—the Cooper House—an excellent school, and churches of every denomination. In the summer it is full of visitors, who wander through the forests and sail over the lake in gay flotillas, the *Nina* at the head, waking the echoes of Natty's mysterious cave, and singing together in the moonlight as they

RESIDENCE OF THE DAUGHTERS OF JAMES FENIMORE COOPER.

drift down from the Three Mile Point. Sometimes parties from the hot dusty cities camp out on the shore to enjoy the cool mountain air, and red and white row-boats, manned by ladies, stop at the Pirate Spring in hopes of catching a glimpse of the white-

ever, O Haunted Lake, with all thy associations and memories! It is pleasant to think that long after this hand is cold in death thy blue waters will still be admired and loved, not only for their beauty, but also for the sake of James Fenimore Cooper.

capped pirate himself lurking among the bushes.

But all the charm of the locality lies in its associations with Cooper, and it is the power of his magic pen which renders the valley and lake so fascinating. There are many pretty villages in our country, many green hills, and many clear lakes; but there is but one Fenimore Cooper, and this one village was his home, these green hills the scene of his stories, and, more than all, this sheet of blue water the delight of his eyes.

Shine on, then, for-

FRENCH ROYAL CHÂTEAUX.

III.—THE CHÂTEAU AND FOREST OF FONTAINEBLEAU.

ABOUT two hours' ride by railroad from Paris, in a southeasterly direction, lies a magnificent domain of forest, covering an area of about sixty thousand acres, and inclosing a vast, rambling, irregularly built, and most picturesque château, whose story is linked with the glories and misfortunes of the rulers of France for more than three centuries back. This splendid edifice stands on or near the site of a castle erected by Louis VII. about the middle of the twelfth century, under whose walls grew up the poor hamlet which in the time of Francis I. became the nucleus of the present town of Fontainebleau. The whole region through which the route thither from the capital passes is rich in historical associations. The neighboring city of Mélnun, mentioned in Cæsar's Commentaries under the name of Melodunum, recalls a long series of remarkable events in the wars of mediæval and modern times, on which we will not stop to dwell. Here, also, it was that the celebrated Abelard, in the year 1102, opened a public school, where he first promulgated the principles and doctrines that awakened such interest and opposition in the Church. The city is pleasantly situated, forming a sort of amphitheatre on the banks of the Seine.

Here are the historical churches of Saint Aspais and Notre Dame en l'Île, and a different attraction, the château of Vaux, now Vaux-Praslin, situated northeast of Mélnun, and built by the architect Levau for the Superintendent of Finance, Fouquet. In this sumptuous residence he spent more than eighteen million francs, the fruit of his exactions and plunder of the revenues. He gave a magnificent fête in honor of Louis XIV., to whom he had just previously offered the gift of a million francs, and whom he dazzled with a greater display of magnificence than the King himself was able to equal. Shortly after this fête Fouquet was arrested and thrown into prison by order of the King, who thus punished a minister capable of such frightful waste of the public funds, and at the same time revenged himself on a rival who had dared to raise his eyes to Mademoiselle De la Vallière.

The dépôt of Fontainebleau is near the remarkable curved viaduct of Changis, which picturesquely spans the valley with its thirty arches. Neither the château nor the city is seen from the dépôt. The latter is approached through a beautiful avenue of plane-trees, and is a place of no special importance. A statue of General Damesme or-

THE COURT OF THE FOUNTAIN.

naments one of the public squares, while another is decorated by a fountain surmounted by a bust of the painter Decamps; there is also a square planted with exotic shrubbery. The streets are wide and the houses low. Being surrounded by the forest, it has few avenues of trade. Some of the inhabitants are engaged in quarrying sandstone, and others in the fabrication of toys cut from juniper-wood, while for some it is a quiet country town which forms a secluded and peaceful retreat—a sort of half-way house between active life and eternal repose. The presence of the court and the summer crowd of tourists bestow upon it a certain periodic animation.

Although the forest of Fontainebleau is any thing but the abode of the naiads—the city having been obliged to contract a debt to supply itself with water from the Seine—yet, according to a long-credited etymology, the name is taken from a now half-hidden spring situated in a reserved garden of the château. It was written variously on ancient maps. The form *fons Blialdi* is the oldest, *Bliadus* being a low Latin word signifying cloak, though there seems to be no explainable reason why this appellation should have been given to the spring in question. At any rate *fons Blialdi* became in French *Fontaine Bliaut*, *Bléaud*, *Blaaut*. Later this was transformed to Fontaine-belle-Eau. Henri IV. sent a note to Gabrielle d'Estrées dated, "From our lovely wil-

derness of Fontaine-belle-Eau." But time dims tradition, and at the present day the name is generally believed to have been taken from the finely decorated fountain in an interior court. The fable of the favorite goat of St. Louis, named Bléau, which is said to have discovered the spring, may be classed among the legends of the Grand Huntsman.

The palace of Fontainebleau, although the late Emperor and his predecessor were accustomed to pay it annual visits, has of late years become a comparatively deserted place, more a sort of geographical museum than a royal residence. To bestow animation upon this vast structure would require an immense concourse of valets, halberdiers, pages, lords, and noble ladies, a luxuriousness of rich vestments and gorgeous coloring—in short, all the varieties of court magnificence which disappeared with the eighteenth century. The sovereigns of modern times can no longer support such a retinue.

The château of Fontainebleau is an agglomeration of many separate structures grouped around as many courts. It is composed of buildings of different epochs and irregular appearance, which are impressive only by reason of their extent. The most ancient and curious part is that surrounding the Oval Court. It forms the centre of the buildings which have been successively added, and has no longer any direct communication with the outside.

The principal entrance to the château is by the Court of Honor, for a long time known as the Court of the White Horse, because of a plaster horse in the centre, which had been moulded by Catherine de Medicis after that of the statue of Marcus Aurelius on the Place of the Capitol at Rome. It has been known as the "Court of Adieux" since it was consecrated by a great historic event of the present century—Napoleon's farewell to his soldiers on the eve of his departure for Elba. He stopped a moment at the top of the iron staircase leading to the horse, of which we give an engraving, then descended the steps, and,

mastering his emotion, addressed a few last words to his Old Guard, embraced its commander, General Petit, and the eagle, and threw himself into the carriage where General Bertrand awaited him. Many of our readers will remember the admirable picture of this scene painted by Horace Vernet.

This is the largest court of the palace, being five hundred feet long and three hundred and seventy wide. It was formerly surrounded with buildings, but in 1810 Napoleon removed the row on the side next the city, and replaced it by a paling, so that the vastness of the space presented to view gives it a certain character of magnificence. Unfortu-

TILE OVAL COURT AND PORTE DAUPHINE.

COURT OF ADIEUX, OR OF THE WHITE HORSE.

nately the Place de Solferino, which precedes it, is narrow, irregular, and badly constructed. In 1864 there was some talk of opening a large boulevard in front of the Court of Honor, which would have given an extended view over the forest; but, as the project was connected with a plan for the improvement

of the imperial route from Paris to Antibes, it was abandoned as too expensive.

The front of the palace, with its five pointed-roofed pavilions joined by the main body of the building, presents only a series of characterless constructions entirely devoid of unity of style. The only thing particu-

larly worthy of mention is the celebrated iron staircase to the white horse, constructed by Lemercier, under Louis XIII., and this is much too massive for the insignificant pavilion to which it is joined. The left wing, composed of one-story buildings, the divisions plainly marked with red brick, and its chimneys ornamented with the initial of Francis I., presents at least a characteristic

simplicity; but the grand right wing shows only a monotonous front, which gives the idea of a barracks or hospital. It was constructed in the time of Louis XV. upon the site of the Gallery of Ulysses, where Niccolo dell' Abate, the most talented of the artists who seconded Primaticcio, had painted fifty-eight grand compositions in fresco illustrating the history of the hero of Ithaca.

GALLERY OF FRANCIS I.

VIEW OF THE PATERNE.

Between the Court of Adieux and the Oval Court is the Court of the Fountain, which opens on the Carp Pond on one side, and is surrounded with buildings on the other three sides.

To the west is the wing containing the apartments occupied by Pope Pius VII. during his exile from Rome. These were constructed under Louis XV., with Doric columns in front, and balustraded attics. Opposite the pond is the Gallery of Francis I., restored under Louis Philippe. This is terraced in front, and was constructed by Henry IV. On the east stand the walls of another

wing, of which the original front, with double staircase, is attributed to the architect Serlio. This wing, which contained the little theatre where J. J. Rousseau assisted at the representation of his opera, "The Village Soothsayer," was burned some years since.

These three opposing fronts display singular incongruities of architecture. Two monstrous figures of lions have recently been placed before that part of the western pavilion where are deposited the rich Chinese and Japanese collections. These figures were brought from China, and are sculptured in that grotesque style so much in favor with

the inhabitants of the Celestial Empire, but which is as far removed from realism as from idealism.

The pedestal of the fountain is now ornamented with the statue of some water-nymph, which, at that elevation, seems to be on the point of falling off backward, and only preserved from such a catastrophe by the good-

will of two dolphins, whose united tails form a seat for her.

The Court of the Fountain communicates on one side with the English Garden, on the other with the Parterre, and by a little alley with the Oval Court, also called *Du Donjon*. The perimeter of the Oval Court nearly corresponds to that of the primitive château.

VIEW OF THE PALACE, FROM THE PARTERRE.

It was there that the old feudal manor was built in the twelfth century, with its towers and *donjons*—a veritable citadel, defended at that time by a moat, and surrounded by a close, thick forest—such as Walter Scott represents the dwelling of Cedric the Saxon, in England, at the same period. There no longer remains any trace of this feudal manor, which was inhabited by Louis VII. and his court.

The old castle was almost entirely replaced by the structure of Francis I., as is attested by his initial, F, and the salamanders sculptured in relief upon the façade of the Gallery of Fêtes, which has retained the name of the Gallery of Henri II., because it was decorated under his reign. The same pell-mell conglomeration of styles is exhibited here as in other parts of the château, but this has, at least, the merit of not being commonplace, and presents some curious examples of the architecture of the Renaissance.

The Oval Court has two monumental entrances, one of which fronts on the Avenue de Maintenon, and extends between the Parterre and the Carp Pond. This is known as the Porte Dorée, less because of the profusion of gilding in its ornamentation than on account of the paintings with which it was adorned by Primaticcio. These are, however, of little interest.

The other monumental entrance, which is designated as the Porte Dauphine, or Baptistère—because Louis XIII., then nearly five years old, was baptized under the dome which surmounts it—opens in front of the Court of Henri IV. It presents a strange and disconnected but, nevertheless, elegant appearance. The exterior façade is in the rustic Tuscan style, and ornamented with two antique white marble masks. Its severe and massive simplicity places it at the beginning of the sixteenth century.

The foundation of the château is probably attributable to Louis le Gros. At any rate, Louis VII., his successor, found a feudal manor already built, for in the first year of his reign he dated a charter from Fontainebleau—Fontem Bleaudi—which he then inhabited, surrounded by the principal officers of his crown. One of his first grants is relative to the founding of the chapel St. Saturnin, upon the south side of the Oval Court. In this he provides for the allowance of grain and wine to be furnished to the chaplain in ordinary times, to whom, with truly royal munificence, he grants an entire ration when the court is at Fontainebleau. "It is our will that whenever we or the queen are in this place the said chaplain shall have four loaves, a half septier of wine, two deniers for his kitchen expenses, and a piece of candle." This chapel, St. Saturnin, was consecrated by the celebrated Thomas à Becket, then a refugee in France, whither he had fled from the persecutions

of the King of England. It has been restored at different epochs, the last time in 1834. The stained glass windows, representing St. Philippe and St. Amélie, were designed by the Princess Marie d'Orleans, daughter of Louis Philippe.

In feudal times hunting was the principal amusement of princes and nobles, and its proximity to the forests made Fontainebleau a favorite residence for the kings of France, almost all of whom had a passionate love for the chase. St. Louis one day followed a stag into the forest, lost his suit, and fell into the hands of a troop of brigands; he sounded a little hunting-horn which was suspended from his neck, and was fortunately rescued. He had a chapel erected near the spot in commemoration of this event. This was destroyed in 1701, because several hermits had been assassinated there. In 1314 Philip the Fair died at Fontainebleau, in consequence of a fall from a horse received while chasing a wild boar. The whole day was frequently spent in hunting. "The same day," said Sully, in speaking of Henri IV., "his majesty, after spending the morning in bird-shooting, hunted down a wolf, and finished the day with a stag-hunt which lasted until night, in spite of a rain of three or four hours' duration. They were then six leagues from the palace, where the king arrived slightly fatigued." This is what princes called amusing themselves!

For a period Fontainebleau was deserted by royalty. Louis XI. shut himself up at Plessis-les-Tours; Charles VIII. embellished the Château d'Ambroise, where he was born and where he died; and Louis XII. lived at the Château de Blois. But now begins to dawn the most glorious epoch of the history of Fontainebleau—the reign of Francis I. The feudal manor gave place to a palace. The breath of the Renaissance, which, even under the preceding reign, had measurably transformed Gothic art, now came to animate the interior of this palace with gay and capricious creations, due, for the most part, to the genius of Italian artists. The grave companions of St. Louis, and the rude bearded warriors of the Middle Ages, were succeeded by poets and savants, and the painters and sculptors of Italy. A host of courtiers, clothed in silk and gold embroidery, and the gay concourse of the nobility, quitted their old castles and the provinces for the enchanting court of a prince who had said, "A court without women is a year without spring-time, or a spring-time without roses."

Francis I. and Henri IV. are the two sovereigns who have done most toward the growth and embellishment of this royal residence. The money expended upon it by Francis I. from 1528 to 1547, the time of his death, amounted, according to the abstract obtained from the archives by M. Champol-

THE OLD OAK—LE PHAEMOND.

lion Figeac, to 2,500,000 francs. Sully estimated at 2,500,000 livres the cost of the constructions, restorations, and decorations executed by order of Henri IV.

The Italians who founded in France what is called "the school of Fontainebleau" are the painters and decorators Rosso, Primaticcio, and Niccolo dell' Abate. Rosso de' Rossi, or Maître Roux, as he was called, was born at Florence, 1496, and poisoned himself in 1541, because he was not able to survive the shame of having unjustly accused of theft, and thus caused to be put to torture, the

sculptor Da Pellegrino, his friend, whose innocence was subsequently recognized. He was a genius of the decadence, a sort of abortive Michael Angelo, possessed of a vigorous but erratic talent. He gave to his figures an exaggerated muscular development, even when they were women and children. The Gallery of Francis I., which is two hundred and thirteen feet long, is covered with his compositions, executed in fresco by his assistants.

A complete system of figures in relief, of caryatides composed of nymphs, satyrs, chil-

dren, fruits, flowers, and divers animals in stucco, encircle medallions and form frames for fresco paintings. These capricious and superabundant decorations, although incorrect in design, are, nevertheless, free and spirited in conception, and serve to make this gallery one of the principal curiosities of the palace. The subjects of the paintings are either allegorical or scenes taken from fable. They gradually fell into decay, and remained many years in that condition until restored by direction of Louis Philippe.

There was a strong rivalry between Rosso and Primaticcio, who succeeded him. Francesco Primaticcio was born in Bologna in 1504, and died at Paris in 1570. He was painter, sculptor, and architect in one—a fact which was, perhaps, his strongest recommendation to Francis, to whom he was introduced by the Duke of Mantua. His name is particularly attached to three great decorations of the château—that of the *Porte Dorée*, that of the chamber of the *Duchesse d'Estampes*, and that of the *Gallery of Fêtes*. These works were restored under Louis Philippe.

The marvel of the palace is the *Galerie des Fêtes*, or the *Gallery of Henri II.*, constructed by Francis I., and decorated by his successor. This was splendidly restored under Louis Philippe. It was lighted by ten windows, five of which open on the *Oval Court* and five on the *Parterre*. Between each pair of these last is a massive projection into the gallery, forming five deep re-

cesses, almost separate rooms, containing many seats, from which the gallery may be seen at ease. The sixty-three mythological subjects with which this magnificent hall is decorated are painted in fresco, and were composed by Primaticcio. They had partly perished, but were restored with some talent in 1834, and repainted in encaustic by M. Allaux. Eight grand compositions occupy the spaces between the arcades of the divisions of the gallery, but, owing to their position, they are seen with difficulty. Many of these compositions consist of a great number of figures.

Primaticcio exercised a favorable action upon French art, less by the charm of his own compositions than by the statues and casts of antique statues which he brought from Italy by the order of Francis I. Among the most remarkable of these are the *Apollo Belvidere*, the *Laocoon*, the *Cleopatra*, the *Venus de Praxiteles*, etc., which now ornament the *Garden of the Tuileries*, and the statue of the *Tiber*, which was melted and coined into centimes in the second year of the republic.

On his return from Italy, Primaticcio had lively quarrels with the Florentine Benvenuto Cellini, whom Francis I. had also charged with the execution of important works. Cellini's violent and irritable temper had made him the enemy of the *Duchess d'Estampes*, who had given to Primaticcio the work on the fountain, which had been intrusted to the former artist. The vindictive Floren-

LONG-ROCKS.

THOMERY, ON THE SEINE.

tine went to Primaticcio, and, unchecked by the courtesy of his reception, told him plainly that if he continued to supplant him he would kill him like a dog; and he was a man to keep his word. Happily this inconvenient co-worker finished by quarreling with the king himself, and returned to Italy without having finished any of the works which he had commenced. The accounts of his personal conflicts with the Duchess d'Estampes are pleasantly amusing. Having one day brought into the Gallery of Francis I. a silver statue of Jupiter which he had just completed, he was surprised to find collected there some beautiful antique bronze statues, and, in spite of his conceit, he could not but regard it as a trying neighborhood. The king and his courtiers praised the Jupiter in language the significance of which he probably exaggerated. But the Duchess d'Estampes, who was called the most beautiful of savants and the wisest of beauties, sarcastically exclaimed, "Truly, one would think you had no eyes. It is in these beautiful antique figures that you find the perfection of art, and not in these modern baubles." Cellini, much exasperated, found means to avenge himself by a rude jest. This resulted in a contest in which he was vanquished, and in 1545 he returned to Italy.

The grand chapel of the court, or of the Holy Trinity, together with the galleries of Francis I. and Henri II., constitutes the most interesting artistic features of the château. The pictures in the chapel were executed by Freminet, surnamed the French Michael Angelo. He was the first painter of Henri IV. He had passed sixteen years studying in Florence and Rome, and was an assiduous imitator of the great Italian. The paintings with which he decorated the Chapel of the Holy Trinity were finished under Louis XIII., and are all that remain of his great works. They were restored a few years ago.

The Gallery of Diana is the longest in the palace. It was constructed under Henri IV. Both the paintings and the structure itself were so fallen into decay that the gallery

was reconstructed under the empire. After the return of the Bourbons it was decorated with the richness and commonplace taste which characterized the style of that period. Charles V. laid the foundation of the library, and employed the literati of France and other countries in order to insure the most valuable collection. Having been pillaged by the English in the time of Louis

XI., that monarch reconstructed it, adding many works. Charles VIII. enriched it with the Greek and Latin collections taken from the King of Naples. Louis XII. had it removed to Blois. Having been very much reduced, it was reorganized by Francis I., under the supervision of William Bude. It was again improved in 1859. Here are preserved the sword and coat of mail of the unfortunate Monaldeschi.

Under the Gallery of Diana extends the Gallery of Stags, which was constructed in 1601, and so named on account of the stag heads and antlers which form part of the decoration. The projecting beams of the ceiling are ornamented with heads of animals and other trophies of the chase. On the walls are the plans of fifteen royal residences painted in fresco. This gallery was, under Louis XV., converted into single apartments. At the beginning of the recent war it was in process of restoration as it was in the time of Henri IV. The murder of the Marquis de Monaldeschi, the tragedy which forms the saddest association of the palace, was committed here. Christina, Queen of Sweden, having found some letters written by the marquis, her favorite, proving his treason toward her, at once determined upon his death, and carried out her thirst for vengeance with a cold-blooded firmness which will always be regarded as inexplicably shocking and cruel, even if we were not compelled to agree with Voltaire that the motive was wounded vanity, "terminating a gallantry with a crime." The Père Lebel, having been summoned by the queen at one o'clock on the 10th of November, found her in the Gallery of Stags attended by three officers of her suit, and a fourth, the Marquis de Monaldeschi, to whom she was showing some letters, at the same time calling him a traitor. "He threw himself," according to the narrative of the priest, "at the feet of the queen, asking pardon, at which the three men drew their swords, and did not put them up until after having executed the marquis. He drew the queen from one

side of the gallery to another, supplicating her to listen to him. Her majesty denied him nothing. 'My father,' said she to me, 'be witness that I give this traitor ample time to justify himself if he can do it.' Then, after two hours' conference, the marquis not having satisfied the queen by his replies, her majesty said to me, in a loud but grave and evenly modulated tone of voice, 'My father, I shall retire, leaving this man to you. Prepare him for death, and take care of his soul.' The three men pressed Monaldeschi to his confessor with their swords, but without touching him. The lost marquis threw himself at my feet, entreating me to intercede with her majesty. I found her alone in her room, with her face as serene as if nothing had happened. Approaching her, I threw myself at her feet, with tears and sobs." The poor monk tried in vain to move her, and even to show her that she ought not to order such a murder in the palace of the King of France. Christina replied that she was queen every where, and that in her resided absolute and sovereign authority over her subjects. "I returned to the gallery," continues Père Lebel, "and embraced the unfortunate young man, who was bathed in tears. He finished his confession in French, Latin, and Italian, according as he could best express himself in one language or the other." The chief of the officers of the queen, who had again sought her presence, returned, accompanied by her almoner, and said to Monaldeschi: "Marquis, ask pardon of God, for you must die without further delay: you have confessed." Being attired in a coat of mail, the swords had little effect, and his death took place only after a barbarous scene of cold-blooded butchery. "After searching him," continues the priest, "and finding nothing of importance, the three retired, and I followed to receive her majesty's orders. She commanded me to care for his burial, and said she wished masses to be said. She sent a hundred pounds for the repose of his soul. He was interred at Avon."

Louis XIV. resided for some time at Fontainebleau. Even after having fixed his residence at Versailles and Marly he made a journey to Fontainebleau every year. He always retained around his person the splendid brilliancy of his court, every member of which was compelled to travel with him, even illness not always being considered a sufficient excuse. Louis XV. and Louis XVI. also sojourned here to enjoy the pleasures of the chase. Louis XV. was only seven years old when the Czar Peter visited Fontainebleau in 1717. "This was the first time the czar had gone stag-hunting," says M. Limon. "Not understanding this exercise, he found it too violent, and thought he should fall from his horse."

The Revolution laid waste the palace, and left it to decay. In 1798 the Black Band de-

manded it in order to cultivate the soil for the nourishment of the people. A committee named by the Institute made a pressing appeal to the government, and succeeded in saving it from devastation.

In 1804 Napoleon spent several millions of francs in repairing and furnishing the palace; but the most splendid restorations were made under Louis Philippe, who, it is estimated, spent about three million five hundred thousand francs upon the architecture, the works of art, and the decorations. On the 6th of May, 1837, the civil marriage of the Duke of Orleans with the Princess Hélène de Mecklenburg-Schwerin took place in the Gallery of Henry II., which had been restored for this occasion.

Besides these historic souvenirs of the French monarchy, and a numerous host of celebrated personages, the decorative style of a part of the apartments, and the furniture of different epochs collected in the palace, transport us to the times of which they are the rare vestiges. We look with curiosity upon the capricious artistic ornamentations in relief which belong to the reign of Francis I.; upon the magnificent gildings of Louis XIII. and Louis XIV.; upon the gracefully delicate paintings by Boucher in the Council Hall; upon the chamber of Madame de Maintenon, preserving the furniture of Boule and the tapestry which is said to have been worked by the girls of St. Cyr; and upon the boudoir and sleeping-room of Marie Antoinette, the furniture of which dates almost wholly from the reign of Louis XVI. Here is also the shabby little mahogany table on which Napoleon signed his abdication. By turning the top of this table a little copper plate becomes visible, bearing the following inscription, placed there under the Restoration, and showing another trace of its pretentious and ridiculous anachronism, "The 5th of April, 1814, Napoleon Bonaparte signed his abdication upon this table in the *king's study*." Louis Philippe had placed here a fac-simile of the autograph of this act of abdication; this fac-simile was withdrawn during the empire.

Now that the history of furniture has become a study, Fontainebleau furnishes a rich chronological series of specimens: the beautiful Flanders tapestry, the cabinets of Francis I., the bahuts of Louis XIII., the mosaic furniture of Boule, the old Beauvais fauteuils, the commodes of Marie Antoinette, from Riésener, with the foliage, the copper-work, and the beautiful carving of the celebrated Gouthières, down to the hard and angular forms of the empire, and thence to the furniture of the Restoration and of the present time.

Before quitting the palace for the forest, the visitor must not neglect the garden, which extends before the southern façade of the palace. In the illustration the build-

MONTIGNY—SUR-LOING.

ings at the right are those of the offices built by Henri IV.; at the left, between the pavilion of Madame de Maintenon and the projection formed by the apsis of the Chapel of St. Saturnin, are seen the five arched windows of the Hall of Henri II. At the left of the Pavillon Maintenon are the buildings which surround the Court of the Fountain and the Court of Adieux.

The Parterre opens on the park, which comprises some two hundred acres, and which is partly bordered by magnificent old trees. Henri IV. had an extensive canal dug here, and Bassompierre recounts that he won a wager of a thousand crowns from the king, who thought that the canal would be full in two days, whereas it required more than eight days for it to fill. In the northern part of the park is the celebrated vine arbor of the king, which is said to produce between six and seven thousand pounds of excellent Chasselas grapes in ordinary years. The stables form a considerable extent of building on one side of the park.

The Carp Pond is one of the popular attractions of the garden. None of the carps date further back than 1815; for at that period the pond was emptied and the carps stolen by the Cossacks.

The forest, which forms the great curiosity of the Seine-et-Marne, extends along the Seine, and comprises about sixty thousand acres. In ancient times it was much larger, including the Forest of Senart, which ex-

tended almost to Paris. Successive retrenchments have reduced it to its present dimensions, which yet surpass those of the forests of Compiègne or Rambouillet.

In the Middle Ages the Forest of Fontainebleau was named *Bièrre* (*Bieria*), a name proceeding, according to some imaginative writers, from a Danish chief, *Bier Côte de Fer*, who in 845 ravaged all the country between Fontainebleau and Méhun, spreading terror by his exploits. Fontainebleau has also its *Robin des Bois*, under the title of the Grand Huntsman. The mysterious legend has long circulated among sportsman and wood-cutters. There is, however, no very accurate description of this illusion, which was seen so often and by so many persons. According to most it was a phantom surrounded by a pack of dogs, who were seen at a distance, and their barking distinctly heard, but which always disappeared on nearer approach.

Nothing can equal the majesty of these ancient groves, such as *Tillaie du Roi*, *du Gros-Fouteau*, *du Bas-Bréau*. The latter was already spoken of as "very old" in 1664. It barely escaped the woodman's axe in 1830; but a general cry of disapprobation from the press saved it. The forest has, however, not always been so well defended, for several of the most magnificent groves were destroyed a few years afterward.

The most diverse landscapes are found in a single walk across the forest. At the en-

FOREST OF BAS-BRÉAU NEAR BARBISON.

trance to the gorges of Agramont its aspect is forbidding and austere. The surface of the dry, rocky soil is diversified only by scattered conical junipers, with twisted trunks, standing out against the sky with their dark and sombre foliage; further on immense birch groves furnish specimens from the extreme northern limit of deciduous forests. Sometimes, in walking along the level crest of a hill covered with pines, a sudden turn will open up a vista over a clear space, when the bluish horizon recalls the Mediterranean Sea as seen from some height of one of the detours on the Corniche road; then from an elevated point the view embraces an immense extent of forest, and takes in only the valleys and verdant chains of hills succeeding each other to the very limits of the horizon. The monotonous grandeur of this spectacle suggests the idea of the limitless forests of our own country; and if the smoke of a wood-cutter's fire arises from some distant point, the imagination easily transforms it into a camp-fire kindled by a band of Sioux or Comanches.

Fresh streams are the only thing of which we need to regret the absence. The permeable sandy soil forms no beds suitable for their reception. It is in vain to descend to the valleys, for we nowhere find the smallest rivulet; only a few ponds scattered here and there contain the rain-water collected in the depression of a plateau or in the hollow of a rock. The absence of birds is a consequence of this aridity; and it adds to

the impression of solitude that the calm and silence are not interrupted by their joyous songs.

The number of deer is now much diminished. A few years ago it amounted to two thousand. The wild boars disappeared rapidly during the empire, because that was Napoleon's favorite chase. They had, however, again become so numerous that the neighboring agricultural population complained much of their ravages, and it was determined to exterminate them. A few years ago several such attempts were made; among others, a hundred of the surrounding peasants armed themselves and turned sportsmen. This clamorous battle was, however, rather unsuccessful. The government at last devised a more efficacious means of destroying these troublesome animals—troublesome not only on account of their constant depredations, but because they compromised the safety of the numerous tourists who daily wander through the forest in all directions. The system of pan-neutage, successfully used in reducing surplus quantities of game, was very effectual. This consists in selecting a portion of the woods containing quantities of the animals, and surrounding it with high nets. Hunters enter this inclosure, driving the game before them. The animals become entangled in the nets, and are either killed or taken alive.

Another serious cause of destruction is the extensive quarrying of the sandstone

THE POOL AT CORNEILLES.

rocks, which contribute so largely to the grandeur of the forest. Enormous quantities of this rock are used in paving the streets and suburbs of Paris. The proximity of the Seine, and the ease of transportation, render this an attractive field.

The devastations have already ruined too many of the most beautiful sections. A few years ago a strange defender arose, who made unceasing efforts to protect the forest, with which his existence was so closely allied that he became known as "The Lover of the Forest." This peculiar life rendered him almost a legendary personage in the middle of the nineteenth century. Had he lived in ancient times he would have passed into mythological history. "Sylvain, believed dead for two thousand years, lives yet," says Theophile Gautier, "and we have discovered him. He is known as Denecourt." The modern Sylvain of Fontainebleau made it his task to render accessible the picturesque portions of the forest. He undertook this work in 1842, and it became the object of his life; to this he consecrated the greater part of the modest fortune that he had acquired after leaving military service. In spite of the infirmities of age, he pursued his object with undeviating constancy, and to his zeal the tourist public is indebted for many paths which reveal the mysterious beauties of vast thickets before considered impenetrable. They not only render the beautiful portions of the forest easy of access, but they bring out the most curious details; rocks particularly imposing from their massiveness or interesting from their fantastic forms, and trees remarkable for age or size. Some individual trees were celebrated before his time, but many have perished, and are either forgotten or their places marked and pointed out to strangers. Among those still existing is that known as "the Charlemagne," situated in a little shady valley of the chain of Mont Ussy. It is well known to landscapists, who come to make studies of this venerable oak. It was mutilated by lightning several years ago.

But great as are the mutilations it has sustained, in spite of the loss of its rocks and its most beautiful groves, the Forest of Fontainebleau is still peculiarly rich in picturesque scenery, and must count as one of the natural beauties of France. The majority of tourists obtain only an incomplete idea of it, because they are satisfied to see it from a carriage, and coach-

men take them to those places picked out by commonplace admiration, such as the Fountain of Mont Chauvet, the Rock of the Two Sisters, and the Weeping Rock, so called because of the water which oozes through the sandstone fissures from an elevated pond. This grotto, situated in the midst of wild scenery, and once interesting, is now tarnished by thousands of names, and the soil, continually trodden, has become disagreeably dusty. The forest reveals its mysteries only to those who have leisure and taste to seek them out.

WITNESSES.

WHENEVER my heart is heavy,
And life seems as sad as death—
A subtle and marvelous mockery
Of all who draw their breath—
And I weary of throned injustice,
Of rumor of outrage and wrong,
And I doubt if God rules in heaven,
And I cry, "O Lord, how long—
How long shall darkness and evil
Their forces around them draw?
Is there no power in Thy right hand?
Is there no life in Thy law?"

Then at last the blazing brightness
Of day forsakes its height,
Slips like a splendid curtain
From the awful and infinite night;
And out of the depths of distance—
The gulfs of purple space—
The stars steal, slow and silent,
Each in the ancient place,
Each in armor shining,
The hosts of heaven arrayed,
And wheeling through the midnight
As they did when the world was made.

And I lean out among the shadows
Cast by that far white gleam,
And I tremble at the murmur
Of one mote in the mighty beam,
As the everlasting squadrons
Their fated influence shed,
And the vast meridians sparkle
With the glory of their tread—
The constellated glory
That the primal morning saw—
And I know God moves to His purpose,
And still there is life in His law!

A GOOD INVESTMENT.

CHAPTER I.

"Remote from cities lived a swain,
Unvexed with all the cares of gain."

FLAMING ROCK is on the easterly side of Smoky Creek, one of the many beautiful streams of the wilder and more picturesque parts of Southern Ohio. The rock rises precipitously to a height of more than two hundred feet from the level of the pool at its base. It is of bituminous slate, so abundant in combustible matter that one day it took fire near the bottom, and continued to burn until a freshet came to put out the flames, six months afterward: whence come the names of "Flaming Rock" and "Smoky Creek."

On a slight rise of ground at the opposite side of the creek stands a log-cabin, and near it are a log corn-crib and ox-stable, both under one roof. The buildings were constructed by the present owner in fee when he began to make his "clearing," but have never since then been repaired by any body. Over a large part of the level ground forming the middle of the valley the creek strays at random, its clear waters made brilliant by flowing, rippling, and dashing over an uneven bed of perfectly black slate. Between the stream and the hill on the west are two small fields, poorly fenced, bearing stunted growths of corn. Extending beyond these, and including the base of the hill up to where it

becomes precipitous, is an imperfectly cleared space, partly occupied by stumps and bushes, where rattlesnakes inhabit, and partly covered with patches of blue-grass and white clover, where hogs and other cattle sometimes range. The hill beyond is, like all others of the region in question, very high, exceedingly steep, and covered with a heavy growth of timber.

Within the stable, before an empty rack and manger, a pair of lean little steers stand and chew the cud. On a stump just without the door of the cabin the proprietor of the domain, the creator of it all—if destroying the beautiful forest with axe and fire may be called creating—sits and chews tobacco.

Old Bill Hagan, lord of the soil though he be, and central figure of the scene, is dressed, to tell the truth, no better than any landless ragamuffin. Certainly no land-holder of any land where men wear clothes at all, except our own, was ever seen with hat, shirt, breeches, and suspenders such as make the costume of this one.

Nor does his wife, Betsey, as she stands in the door-way behind him, appear to any better advantage. Her haggard but erect form is covered in part by an old calico gown, faded, but not with washing; torn in many places, but nowhere patched or darned; supplemented where deficient with a red flannel petticoat, and under that with a shift, perhaps; the jupon and skirt, such as they are, being distended at the bottom with a bamboo hoop. No cap adorns or hides her tangled locks of iron-gray, and her feet are as bare as her head. In appearance a very hag, there is no reason for doubting she is really one. Had she been a saint, she could not have lived thirty-five years with Bill Hagan and borne him sons and daughters. She can scratch, bite, gouge, get drunk when she can obtain whisky, steal, whenever in that poor neighborhood she can lay hands on any thing that is a subject of theft, and has a gift for scolding such as few women are blessed with. She has been known to stand in that door-way, close behind where her husband sits, and, with arms akimbo and wagging head, storm at the man until she fell down in a vertigo. It should be added that in this she is encouraged and led on by the rock, which has an admirable echo, and always responds promptly and distinctly to whatever she says, sometimes blaspheming frightfully in doing so.

In their earlier married life Bill used to knock his wife down whenever her scolding became tiresome; but he learned by experience that she and her ally were too much for him, since they could keep up the din even

after she was down, and he finally gave over the gentle discipline. Both of them attend all the religious meetings held in that wild and inaccessible district, and both have repeatedly "got religion" after the fashion of the country, and been several times admitted to membership in the Methodist church. Queer Christians they are, to be sure; but they are of a queer community, concerning which an old elder who once rode in that circuit said, "If it is the Lord's will to have a church on Smoky Creek, He must take the people jest as they be."

The old couple were alone together—alone and lonesome—for, two days before the opening of our story, their son Bob, sixteen years old, and the last of their surviving brood who remained at home, had run away, and, what was worse in the old man's opinion, taken with him his father's rifle, a weapon that was in some sense the same as a crutch to its owner, since, from long habit of taking it with him wherever he went, it had become almost impossible to go a hundred steps from the door without it. In fact, when he had tried on that very morning to stroll up the valley out of ear-shot of Betsey's voice and the black rock's echo, he had not been able to get any considerable distance away, so returned and resumed his seat on the stump, where he remained, saying nothing and doing it, while the sun of July mounted to mid-heaven, and the oxen, with the yoke still on their necks, waited idly in the pen.

Bob had been a real comfort to his mother and father. While he remained about home he was always doing something to furnish the one with text or pretext for a scolding; and in occasionally threshing out his wild oats with a hoop-pole, the other enjoyed a satisfaction which only a parent can know.

But Bob was gone, such as he was; gone from his home, such as it was. Though barely sixteen years of age, according to the tenth row of notches cut upon one of the house-logs, the many stories of battle he had heard told by soldiers returned from the war of the rebellion had roused up the wolf that was in his young blood, as it is in the blood of all humanity, so that he longed to be where men were killing each other, and resolved to seek the sport on the first opportunity. Very opportunely for him there came the raid of John Morgan into Ohio, which, as all know, was in the month of July, 1863. News of the movements of the raiding forces through the country lying to the northward had from time to time been brought by travelers passing down the valley, and the last report, which had come late in the afternoon of the day before the boy disappeared, was that the main body was expected to reach Piketon, a village twenty miles distant, some time during the next day.

And thus, instead of Bob's going to war, war was actually coming to Bob, and he ac-

cepted the issue. Waiting only for night to come and cover his movements, he quitted his sheetless little bed in the loft as soon as the snores of the old people acquired the proper intonation, descended to their apartment by means of three pegs driven into the logs of the house to serve the purpose of the more costly luxury of a ladder, noiselessly removed from its hooks over the fire-place a very old rifle, with its scant supply of ammunition, stole out into the night, and took his way up the creek. Considering as he went what plan of campaign should be adopted, he decided to make for a point where he would be likely to strike Morgan's line of march several miles before it reached Pike-ton and the level country of the Scioto Valley, his design being to hang upon the skirts of his enemy and harass his flanks. This was very good generalship, it must be admitted, and subject to only the one criticism, that it amounted to "bush-whacking," as warfare in the retail way is termed, the retailers being considered as without the merciful pale of the laws of war, and liable to be shot or hung whenever captured. After ascending the valley of the creek for a distance of five or six miles, and, in going that distance, crossing the devious stream fifty times, he struck off abruptly to the right, and mounting by a rough sled track that came down over the edge of the nose, as it were, of a spur from the hill which bordered that side of the valley, reached one of the peculiar roads which are found running along all the summits or ridges of the steep and narrow hills of that country. These "ridge roads," so important to the inhabitants, form a system of ready-made highways, furnished by nature, with the hills they render accessible, free of cost to county or township treasury. Just as they are to-day they seem always to have been. Trodden formerly by the Indians, as now by the whites, they are kept open as much by the hoofs of beasts as the feet of men. The traveler on one of them finds himself sheltered for the larger part of the way with interlacing branches of trees which border it, though occasionally he will traverse open reaches where the sun-blest ground is covered with a coarse grass, or if too poor to bear that, decked with wild flags, pansies, and roses. Sometimes he will meet with one of those almost mysterious shallow basins of water called "bear-wallows," that seem to exist without any drainage adequate to fill them. Even when the later heats of summer dry up wells, and drive the creek in the neighboring valley to hiding-places beneath its gravelly bed, the bear-wallow, though it grows narrower and shallower daily, seldom or never is found entirely empty.

Bob turned into the ridge road and kept in it until he had gone some twenty-five or thirty miles, crossing the head waters of a

good many creeks and "runs," but without descending into any of their valleys or ravines. Though the ridge, and the road with it, crooked and turned in an amazing manner, and though branches from it led off toward every spur to the right or left, his knowledge of the habits of the hills and ways of the forest saved him from going astray, even after he had passed beyond the limits of any of his previous wanderings. And when, at length, about the middle of the forenoon, he halted on a bald summit, or "knob," that overlooked a wide and fertile well-peopled valley, such as he had never before seen, he knew perfectly well where he was, and that his objective point was reached.

There was a tall white oak near the knob, from whose top a better survey could be made than from where he stood; so, leaving his gun at the foot of the tree, he climbed till he reached the highest limb that would bear his weight, and, seating himself astride it, with his arms embracing the body, looked off.

The bird's-eye view thus obtained covered five or six miles of the creek bottom; and what he saw there soon satisfied Bob that his information had been correct, as well as his inferences thence derived—namely, that Morgan's forces must come that way, and could not be long in coming, either. The commotion of the inhabitants showed their panic to be great. Cattle and teams were being driven off in all directions but one. From the nearer parts of the valley shouts and cries came faintly up to the ear, and away in the distance, beyond reach of hearing, there could through that clear atmosphere be discerned Lilliputian people running about hither and thither, every little head of a family and all the little members of it behaving very much as they would if their house were on fire. After one or two hours the scene became quiet. The cattle had been driven away, all wheel vehicles had disappeared, and so had most of the inhabitants, though some of them still remained by their property and homes, animated by a noble resolve to face the danger they knew to be coming.

By this time the boy began to feel hunger. He slid down from his perch, resumed his gun, and descended into a "cove" at the head of a ravine whose course was toward the valley, and clambered along over great masses of rock fallen from the ledges above, and which roughly paved the bed of a torrent accustomed to roar there in times of rain, till he reached a little pool, or pocket, of water. There, seated on a square block of stone, whose covering of velvet and plush, if it had been real instead of imitation, as it was, and as were all the beautiful hangings of that chamber in the hills, might have cost a cavalryman's equipment, he took from his

only pocket a couple of "dodgers"—favorite and appropriate food of bush-whackers—and ate them for his breakfast, drinking during the meal one or more gallons of the water, which last he accomplished by making a notch in the edge of the platform of soft sandstone over which the slender surplus of the pool trickled away, deep enough to draw into a single stream all the overflow, and then putting his under lip to the notch and letting the water enter his mouth as it would.

It ought to be mentioned that the element lost none of its thirst-quenching property for Bob merely because during the repast another bush-whacker of somewhat different species appeared and marched boldly up to the edge of the pool, where he drank his fill. This one was arrayed in butternut and black; his motto was "Don't tread on me;" and the other, after killing him, counted eleven rattles in his tail.

The search after water had carried the lad well down toward the foot of the hill, and on his going a little further the view opened on a cleared field, occupying a swell of ground at the base—a portion of one of the valley farms, inclosed on the nearer side by a stone and rail fence, and on the further bounded by the highway. The distance across this field was no more than a convenient rifle-shot, and the low wall of stone afforded as good a breastwork as any free-shooter could wish. Before posting himself Bob moved along the fence to a point where it was crossed at right angles by a path that led directly up a point of the hill, and thence back to the place of his first look-out. It was the highest part of the field, and commanded a clear view for two or three miles up the road. Besides this, the path would afford a most excellent way of retreat. So there, after first inspecting the condition of his piece and his resources of powder and lead, caps, patches, and grease, he took up his position; that is to say, seated himself behind the fence. He was well placed; neither Grant nor Garibaldi could have posted him better.

He looked up the valley, but no Morgan's man was to be discerned. He listened with open mouth as well as ears, but no hostile sound was heard. He fell to reflecting on the situation, and so reflecting, fell asleep. While he slept the whole scene was transformed, and when, an hour later, he woke up, astounding impressions burdened his every sense. Field, forest, and hill were fraught with life and movement. A stifled, low-toned thunder spoke from the ground; dust filled the air; a rifle-shot was heard, and then several more, and distant shouts. Then, beneath a rolling dust cloud about a mile away, the head of a column of horsemen came, advancing at a trot. A distinct sound of hoofs from the opposite hill drew his at-

"AND WITH THE PHOTOGRAPH LYING ON THE TABLE BEFORE HIM, HE HELD HIS HEAD FIRMLY BY THE HAIR."—[SEE PAGE 52.]

tention, and roused him to astonishment and something of alarm, as he saw there a squadron of horsemen moving rapidly along its ridge road, parallel with the movement of the main body, but so far in advance of it as to have already passed the point opposite him. An instant later he became aware that a similar squadron, moving like the other, parallel to the central force, was even then trampling along the ridge back of him, and had actually crossed the junction of his path of escape with the road by which he had come, cutting off his well-planned retreat, and bringing to naught his whole art of war. Bob, my boy, the Philistines are upon you! You are outflanked, outgeneraled, outdone! Arouse! rally your forces! hold a council of war to decide quickly as a council can what next to do!

Bob couldn't.

His head grew hot, his eyes dim; his tongue and mouth became dry; his heart thumped his ribs; something choked him and stopped his breath; he reeled and fell back

upon the ground, where the dead leaves rattled under his quaking limbs. The symptoms will easily be recognized as those of the "*buck fever*," with its attendant ague, such as every hunter is, once in his life, attacked with, when for the first time a deer presents itself in all its forest-born innocence, dignity, and pride to the aim of his weapon. Bob was a hunter, and once before had felt the fever; but never before had he beheld bucks such as those which now by hundreds careered down upon him, every steed in the herd a blooded animal, and nearly every rider too: dare-devil, born jockey, and natural dead-shot.

Bob couldn't.

But buck fever is an acute disease, not a chronic one, and, where the constitution is courageous, soon passes off.

As none of the horsemen on the hill at his back had pass-

ed within sight of our hero—if so the scared boy might be called—there was sufficient time before those in the valley came up for him to recover, first his senses, then his strength, and lastly, his courage and resolution; and some minutes before the foremost of the column had got abreast of the ambush he had thrust his gun half-way through an opening in the wall, cocked it and made quite ready. No sooner, however, did he "sight," or try to sight, the horseman in question, a fine specimen of manhood by the way, and a perfect stranger to Bob, than the thumping against the ribs again began, and he was obliged to desist. Recovering his nerves again, a few minutes later he tried once more on another stranger, but failed, and so on for several attempts; and though he was gradually acquiring steadiness, yet by the time he got really in position to shoot with good aim half the column had gone by. And then another difficulty arose. He had been looking into the faces of his foes as they trotted along, and had

seen they were human faces like his own. He had been getting acquainted with them, as it were. Many of them seemed boys no older than himself; they were of his *kind*, and his heart grew averse to shooting them. In fine, he abandoned all intention of killing any body that day, and resolved to peaceably retreat as soon as it should be safe to do so. Figuratively speaking, the angel of mercy had descended, and was weeping warm tears into the powder in the pan of Bob's blunderbuss, just as is represented in the celebrated old picture of "Abraham offering up Isaac." But right here the devil must put in a word, in form of a rifle-shot that resounded from the opposite hill, about a quarter of a mile up the road, and which seemed to cause disturbance among a group of stragglers who were pressing forward their tired horses. Three or four of these at once dismounted and dashed into the woods, while a few of the others discharged their pieces in the same direction, and the rest seemed to occupy themselves with some object on the ground. Bob's attention was concentrated on the pursuit which was plainly being made after a brother bush-whacker not too soft-hearted to pull trigger. The chase lasted some considerable time, and when two of the pursuers emerged from the forest, dragging between them a poor hatless wretch, none of the raiders remained in sight except a small body, a kind of rear-guard, that had just been halted in front of Bob's position, and a few of the stragglers, who still remained opposite the place where the shot was fired. The captors brought their prisoner across the creek, and up to the officer commanding the rear-guard.

"Who have you there?" the officer demanded.

"A bush-whacker, colonel," was answered.

"Why do you bring him here then? You know well enough what to do. Take him over there" (pointing to the woods immediately behind where Bob lay), "and leave him."

The men, obedient to the command, whose meaning all understood, began to let down the bars of the field, when a young officer came galloping down the road, and suddenly pulled in his horse beside where the prisoner, whose legs were doubling under him, was being held up. Instantly dismounting, the new-comer drew a revolver and discharged it thrice at the doomed man, who dropped dead. A fourth shot was then heard, and the young officer himself fell. A whole volley scatteringly followed. The fourth shot was Bob's, and the scattering volley was all aimed at him as he sprang up the steep hill, swift as a deer. He was hotly followed, and by as agile woodmen as himself, and would hardly have escaped had he not beforehand well considered his line of retreat. Without attempting to do his running in the thickets

which covered the hill-sides, or among the rocks in the beds of the ravines, he kept boldly on the beaten way which led him up to the ridge road, followed that road a short distance only, then dashed through a thicket at the head of a cove, and gained a side path on the top of a spur which he knew diverged from the main ridge a little further on; followed that till, nearing the point of the spur, its direction became obscure; then, quickly dodging round a hollow tree whose lower opening was on the side opposite the quarter whence pursuit came, and was concealed by undergrowth, he sprang into it and began to clamber upward. He might have continued till he emerged at the upper opening in the tree-top, through which, forty feet above, he could see daylight pouring in, but feared he would make too much noise in doing so, as each movement detached masses of rotten wood that fell rattling to the bottom, so contented himself with attaining a convenient resting-place ten feet from the ground. There he remained while the pursuit came up, swept by, fatigued itself, and was given over, and remained for a good while longer, in the apprehension that his enemies might still be lurking near, having only pretended to give up the search: in this overestimating his own importance, as we all are apt to do. At length he thought it safe, not to descend and continue his flight, but to mount to the top, and there see what could be seen. Elevating then from the hole only his head and arms, he hung by the elbows, with the rest of him concealed in the hollow trunk, and looked about on every side, until, perfectly re-assured at last, he scrambled out, and descending by the more pleasant outside of the tree, started on the road homeward. As he feared to return to the main ridge road, our hero, as he may now be truly called, since he has drawn blood, descended the point of the spur by a path that led into a small creek or run, and followed its course until it entered the valley of a considerable stream, whose general direction was parallel with that in which Morgan's forces were moving. Here he paused, and was looking to discover a point by which he could mount to the ridge of the hill on the further side of the stream, when the sound of horsemen approaching from up the road sent him to cover in a thicket of sumac. Lying close, and carefully avoiding to stir the bushes or breathe too loud, he was able, undetected, to observe a party of five go by, all of them evidently Morgan's men, of whom the hindmost was leading a sixth animal with empty saddle, to which was fastened a pair of old-fashioned saddle-bags. But they had hardly passed him before they halted to allow their horses to drink in a deep, clear pool at the roots of a sycamore stump.

While there, the one who rode at the head

of the party examined his watch, then a pocket-compass, and afterward looked around him. Something there was in his features that reminded the boy of a face he had seen before, and that impressed him painfully. After making his survey the officer, for such he was, said to the man nearest him, who seemed of much rougher aspect than the rest, "Brown, have we not gone far enough on this course?"

"I think we have, lieutenant," replied Brown. "I reckon, if we take up this p'int right yer, and bear to the east, we'll come shortly on to the main ridge about seven miles below whar we left it. By pushing on smart we kin be thar before they all get by."

"How do you happen to know so much about this infernal abolition country?" asked another of the men, as the officer moved further on.

"When I lived in Cavern County, Kaintuck, I was in the horse business, and that sometimes brought me over yer."

"The horse business!—oh, I understand. Cavern County horse-dealers sell a good many more than they buy. They have a way, too, of swapping horses."

Not this remark, but the laugh of the others, caused Brown to redden, and say, "I want to know what you and John Morgan and the whole lot are doing but swapping horses?"

"Oh, this is war."

"Is it?" rejoined Brown: "then I'd like to see jest a little fighting to prove it. Since we crossed the river about all we've done has been a runnin' off horses and dry-goods. Pretty fast runnin' it's been, too."

Further criticism on the conduct of the war was interrupted by one of the men exclaiming, as he looked back, "Why, where's old Hector? Lieutenant, Hector's missing." The lieutenant made no reply, seeming to occupy himself solely with examining the path up the point which Brown had indicated, and which seemed almost too rugged for horses to ascend; but another of the party said, in rather a low tone, "Don't you know he left him to take care of the body?"

"This way, men!" cried the officer, as his horse sprang up the hill. The others followed, one by one, imitating their leader in not dismounting; and the spirited animals, jaded as they were, achieved the difficult ascent without one false step. But the led-horse, whose bridle was held by the last of the party, on reaching a place where the path was too contracted to admit of two going abreast, reared, broke loose, and, wheeling round, dashed down the hill again.

"Go back, and lead her up," said one.

"Let her alone," said another; "she'll follow of herself fast enough in half a minute, and a good deal better than you can lead her."

The last speaker was right, so far as this,

that the mare halted at the foot of the hill, and was, in fact, turning again to recommence the ascent, when Bob, darting from his thicket, seized the trailing bridle, leaped into the vacant saddle, and when the raiders stopped on the summit to give their horses breath, the young bush-whacker was galloping her at full speed up the creek, more than a mile away. Fifteen minutes later he had reached a place of safety, where dismounting, he flung himself on the ground to rest until it should be dark enough for him to venture back to the spot near his first ambush, where he had dropped the rifle, and to the hollow tree, where he had concealed the pouch and horn, without which he by no means dared return to his father's house. Meanwhile, holding tightly by the bridle the mare he had adopted, though allowing her to crop what grass was growing near, he began to meditate on his two exploits—the first, emptying a saddle; the second, filling one. It is not to be wondered at that he could better bear to think on the last than the first. As the animal moved around him he could see blood spots on the leather. He recalled what the horseman had said of a negro being left behind in care of a corpse. The shadows were darkening in the forest. For the first time since the bush-whacker was born he felt averse to being alone, and for the first time, too, his imagination began to act, making the shadows of the trees take unpleasant shapes as they grew darker and darker.

CHAPTER II.

"Come see rural felicity,
Which love and innocence ever enjoy."

THE condition of things as they existed at the farm-house of Flaming Rock on the day following Bob's achievements has already been described on the first page of the preceding chapter, where it was mentioned that Bill Hagan sat upon a stump by the door and chewed tobacco. It was noon; the weather was hot, and stillness possessed the valley and all its inhabitants, from Hagan on his stump to the cricket in the woods. It was a good moment for listening, and, in fact, the dog of the family was listening, as he lay in the sunshine with half-closed eyes. Maybe Mrs. Hagan listened too, for she had held her peace during a long hour.

Suddenly the brute began to rap on the ground with his tail; then, starting to his feet, stood looking up the creek as if awaiting further information.

"That's Bob he hears," said the woman.

"Nary Bob," said the man, after one or two minutes of close attention: "a boy's feet don't make them sounds; them's the hoof of a horse."

The dog still remained in the same position, whining, but low and doubtfully, an

wagging his tail, but slowly and with indecision; while the mother almost whimpered, "Oh dear! I do wish the or'nary fellow would come home."

"I wish he'd get shot," growled the father; "that's what he deserves for stealing my gun. Sure as you live, if the villain ever does come back, I'll teach him how to run off in the night, to go a-cavorting round coercing sovereign States of this Union, with a hoop-pole."

"Your gun!" broke out his wife. "I hope he'll fling the dog-oned old thing into the creek. It 'ain't shot so much as a ground-squirrel for the family to eat this ten year. If it was worth shucks you'd ha' gone and traded it for whisky long ago. It would ha' gone where them hogs went that I was fattening for my winter's meat last year, and where them ten gallons of berries went that I and Bob worked two days in the sun to pick, so't I could get a little tobacco and a few notions (and almost got snake-bit at that), and you run off with after dark; and you know very well where they went: they went down that durned red gullet of yourn. Yes, there's where the hogs went, and there's where the huckleberries went, and there's where I wish the durned old rifle was rammed down this minute. Oh, you couldn't go and run off a horse, I suppose? No, no! that would be too scary a business for such a coward as you; besides, it's too much like work. A woman can love and respect a man if he does steal a horse now and then for the support of his family, but who cares for a durned sneaking huckleberry thief? But what good would it do if you stole a dozen horses? you'd drink 'em all up; you'd swallow a mare with foal."

She might have gone on at indefinite length—for she was perfect mistress of the subject—had not the loud barking of the dog as he bounded away brought her to a full stop, and left to the rock, that had faithfully echoed all she said, the privilege of being at last distinctly heard as it uttered the words, "*A mare with foal*," while the animal thus announced appeared, coming at full gallop round a turn in the road, and swiftly approached the astonished couple—astonished to see her bear triumphant on her back her own conqueror and their own boy, Bob, who sat widely astride, with extended heels and elbows, every rag of him and every hair fluttering and streaming in testimony of his identity.

With difficulty the young rider pulled up when he came opposite the ox-pen. Dismounting there he expelled the cattle and installed his steed in their place, supplied the feeding-trough with ears of corn and the rack with corn fodder, took off bridle, saddle, and saddle-bags, and then, with the bags over his shoulder, and carrying the gun in his hand, walked into the house.

"Give me something to eat, old woman, and be quick; for I'm just the hungriest and tiredest fellow you ever did see," was his only greeting, as he hung up the rifle, with its horn and pouch, and flung the saddle-bags on the floor, and himself beside them. The mother made no other reply than to go about the preparation of a cake of corn bread, while the father went and examined the condition of the gun; and on finding it correct, resumed his seat, growling, "It's well for you you fetched it back, you whelp!" In that simple dwelling, though time was as cheap as among the Bedouins of the desert, none of it was ever wasted on ceremony.

Long before the cake could be mixed and put in the spider to bake, the tired and hungry fellow was asleep, reposing on his bags, which was a pity, for each of his parents would have liked to look into them. As it was, Hagan walked out to inspect the horse. She was a beautiful bay, evidently of high blood; but little signified to him her delicate shape, her slender limbs, her silken coat covering ivory bones, her moving nostrils, and flashing eyes—proofs of a descent from a hundred generations who had eaten barley from kind and affectionate hands in the far land of Arabia, which we call barbarian; he was examining her qualifications for the plow, and these he judged to be sufficient, considering the light and friable soil of the creek farm. A thought had struck him, and at the conclusion of his examination he muttered, "She'll do; I'll sell 'em to-morrow."

Sell what? The oxen, to be sure, now rendered supernumerary by the acquisition of the horse. As to the use to be made of the money they would fetch, Mrs. Hagan has already sufficiently informed us in her statement of the case. But let us now hear the other side of that case. The truth is, the farmer of the creek had of late found himself, for the first time in his life, in straitened circumstances. Until the war came, with its heavy tax on whisky and tobacco, he had always lived in ease and comfort for all he knew to the contrary. Such portions of his leisure as he could spare to the labors of his farm or to lumbering in the hills had sufficed to procure him all the necessaries of life. If he had needs that went unsatisfied, he did not know of them. Necessity, they say, is the spur to action; out of activity comes progress, and with progress civilization, and all that kind of thing, about which Hagan knew or cared not one straw. Now he had never known other wants than what a very moderate amount of labor would supply; and Hagan was not the man to go and look up unreal and imaginary wants to spur and torment himself with. Could he have been persuaded of the real necessity of shoes and hats for children, ribbons and laces for women, cabinet-maker's furniture for houses,

and broadcloth for his own clothing, he might have been stimulated to toil and moil from Monday morning till Saturday evening. As it was, however, he remained too much the ideal of the ancient philosopher, and practiced too faithfully the much-commended virtues of simplicity and contentment, to long after the frivolous things that bestir the progressive world. In only one respect did he resemble the progressive man, and that was in the limitation he had imposed on his own hours of labor. In every week he worked two days to procure food and raiment, drink and tobacco, and devoted the other five to consuming these and to meditation; and by force of habit those days of leisure had become as really needful to his existence as house or clothes, food, drink, or quid. But suddenly in the wane of that existence comes Congress, with its rude taxation, and makes whisky to rise in price from fifteen cents up to fifty cents per quart, and tobacco to advance in the same proportion, putting those two articles of prime necessity quite beyond the capacity of his ordinary income, and compelling resort to extraordinary ways and means; such as converting into spirits the stock hogs of the family, and sequestering for the same purpose his wife's huckleberries.

Such is the case of Mr. William Hagan, given without reservation or gloss; and, notwithstanding the one-sided statement of Mrs. H., the reader must confess it is a hard and a strong one, and will be slow to blame him for the disposition he contemplates making of the superfluous cattle.

On returning to the house Hagan found Bob occupied with his repast, and Polly engaged in rifling the saddle-bags, whose contents she had emptied on the floor. There was little of value: only a few shirts, drawers, and socks, a tooth-brush, a comb and brush for the hair, some pocket-handkerchiefs, and two towels.

"Oh, let the boy's plunder alone," said Hagan, in a tone of unusual good-humor, the result of his resolution to appropriate to his own use the principal fruit of Bob's expedition. "Let him have the things if he found 'em. Them ain't woman's plunder, nohow."

"Hold yer jaw!" replied the other. "What does he want of all these here store clothes? I'm going to have some on 'em, sure's you live," filling her lap at the same time with the chief portion of the "plunder." As she did this something fell out of the fold of one of the towels, and rolled on the floor till it came within reach of her husband, who seized it quickly and eagerly, but without saying a word.

"What's that?" cried Bob, dropping his corn bread and springing up. Then, flinging himself upon his father like a young wolf, he cried, "Now you jest give that to

me. That's my pocket-book; I shot the feller that had it, and it's mine," at the same time seizing upon and struggling to wrest from his father's grip the article whose morocco case and gilt clasp had deceived them both. His efforts, though unavailing to win the prize from the resolute hold that retained it, tore apart the clasp, and disclosed to the view and disappointment of all only the photograph of a little girl.

"There, take your picter," said the elder, after holding it out at arms-length and examining the brass-work to see if it might not be gold, while holding the boy by the hair at arms-length in the opposite direction: "*I* knew what it was all along. I only wanted to devil you jest a little. It's a picter; some folks call 'em likenesses."

Whatever knowledge the man possessed of pictures and likenesses, the woman and boy did not share in it; and they both continued for some time to look at the one in question. She regarded it and its casing with mere curiosity, which having at length satisfied, she turned away and went to hide her "plunder" as well as she could in the old tumble-down corner cupboard. But Bob saw more than his mother did, and, with the photograph lying on the table before him, he held his head firmly by the hair with each hand, and, resting on his elbows, continued to look. There was something in the features and especially in the eyes of the beautiful child of ten whom the picture represented that fascinated him, but not with any pleasant effect. There was beauty there, to be sure, but no sense of Bob's appropriated that. The sense of the beautiful had never been awakened within him, so far as he was informed or believed, but lay as dormant as a possible taste for the Greek classics; and this, although he had been born and reared among delightful landscapes, daily repainted and re-illuminated by sunrises and sunsets as glorious as any skies of the round globe can show. Or if perchance a spell was working on the undeveloped faculty by the charming image that lay beneath his gaze, it was with a most vague effect.

Then what was it so fixed the attention of the untaught boy? The eyes. Mild as their expression was, it recalled, dimly at first, plainer afterward, an expression he had seen before that was not mild but terrible. Mild and sweet as they were, they made him see again the angry and almost demoniacal look of the man whom he had but lately seen put a fellow-being to sudden death, and whom his own hand, an instant later, had sent into eternity. And the more he looked, the more the eyes of the girl seemed to change into those of the red-handed guerilla, until all the sweet radiance that first beamed from them vanished, and there shone out instead, as from burning coals,

the untempered glare of hatred and revenge. The boy's sensations became insupportable. With an effort as if for life he closed and clasped the case, and holding it firmly in both of his convulsed hands, ran out into the air and made his way into the woods beyond the creek.

What did he mean to do with the thing? There was fire enough remaining on the hearth to consume it to ashes. The pool at foot of Flaming Rock held water enough to receive and hide it. Or he might bury it in the ground as they do dead people. But he had no thought of destroying it. He clung to it—why he knew not—by force perhaps of that strange instinct that has caused other man-slayers, whom we call murderers, to carefully preserve for years the proofs of their crimes and the very means of their ultimate detection and condemnation.

After moving aimlessly about for an indefinite time he stopped at the foot of a cliff formed by alternate layers of sandstone and clay shale, piled one upon another to the height of hundreds of feet, and there rested for a while. Presently he seemed suddenly to receive an idea, and began to climb the difficult face of the cliff, until, when nearly at the top, he reached and crawled into a hole, or low-roofed cave, formed between two ledges of stone, partly by natural disintegration of the shale, and partly by the fingers of the Hagan children, who had made it their play-house. Into one of the many niches in the sides Bob thrust his direful treasure, closed the mouth of the niche with clay so as to effectually hide it from any of the few persons who knew of the place and of the perilous way up to it, and who might chance to visit there; having done which he returned home.

CHAPTER III.

"And when his hour of joy is done,
No trouble need he steal or borrow;
A night of sleep is swiftly gone,
And he'll get drunk again to-morrow."

THE mare, on being tried, worked very well in the plow, and accordingly the oxen were driven away and sold. The money thus obtained, after paying for a sow with a litter of half-grown pigs to replace those so improvidently disposed of, proved sufficient to purchase a barrel and a half of whisky, besides a store of tobacco. The whisky was not brought home, but was hid away among the hills, in a place so secret that no discovery need be feared unless some one should have the boldness and cunning to follow Hagan when he secretly visited it with empty bottle in one hand and loaded rifle in the other. The supply lasted him considerably more than a year, for he was a prudent drinker, and husbanded his re-

sources; that is to say, save a few bottlefuls bestowed on her in the first flush of his generosity, he gave none of it to his wife. Truth to tell, she did not deserve even thus much, for with each bottleful she got drunk, and berated him shamefully for his evil habits, and taught Flaming Rock to swear several new and strange oaths.

Two months after her capture the mare gave birth to a foal, which Hagan presented to Bob in a manner that implied its mother belonged exclusively to the generous giver. But as the son rode upon her whenever he wished, it mattered little who paid taxes for her. Every day it lived the colt grew more and more interesting, and Bob grew more and more fond of it; and so the season wore on without its occurring to him that his father's supply of whisky could ever be exhausted. But when midsummer of the following year went by, and the dog-days came, and beneath the power of the ardent sun the creek began to run dry in places, the whisky barrel went dry also; and so did Hagan—for several days, which made him nervous, and disposed to sit silent on his stump and indulge in sombre meditation. And well might the unfortunate farmer feel gloomy and disgusted for present and future. The war tax had been increased more than sevenfold within the year, and in a few months it was to be increased tenfold! At length he remembered he possessed a horse; the next day that horse and its possessor disappeared. Two days afterward he reappeared a good deal the better for liquor, and met and bore the combined reproaches of wife and son with the calmness of a real stoic.

At first Bob thought seriously of beating his father, but gave up the idea from fear he might get the worst of the battle. Then he grew sulky, and refused to work or speak; but the elder thrashed him with a hoop-pole, and forced him to come to order. Summer went, and autumn came; and winter would surely follow autumn. Meanwhile the colt, being well cared for, was growing apace, and the whisky was being daily consumed. How much of it the price of the horse had procured the boy was unable to learn; nor could he reckon how long it would last. In fact, though the horse sold for more than the oxen brought, the result, in liquid measure, was considerably less. A truly patriotic man—which Hagan was not—would have been consoled by the thought that while consuming the highly taxed article he was replenishing the national treasury, and saving the national life as effectively as if he risked his own (in another way) on the fields of war—unless he happened to know that in those days precious little of the tax found its way into that treasury, and that the millions of earnest drinkers who fondly imagined they were drinking up the

war debt were really doing little better than Scandinavian Thor did when he tried to drain the cup which an ocean was constantly replenishing. And if, instead of sacrificing only the two oxen and one horse on the altar of his country, Hagan had offered up a hecatomb, twelve of the cattle would have gone into the war chest, twelve more to compensate the distillers, and the remaining seventy-six to fatten and encourage speculation and fraud. The horse had procured only a barrel of liquor. Unhappy America! once it would have purchased eight!

The whisky was going; and after the whisky, what? The mare was gone; and after the mare, what? What but the foal, to be sure!, following the prophecy of Mrs. Hagan in her random railing. It was Bob's turn now to sit upon a stump, and reflect on all this. The resolution he adopted, after weeks of deliberation, was to get beforehand with his despoiler, and himself run off with his property. But here came the question where to run to, and how to feed and clothe himself and feed and rear the young animal. And this resolved itself into the problem he had never yet faced or considered, namely, what should he do for a living?

Work!

Like all other creek boys, he could plow and hoe, gather and husk corn, fell trees, chop logs, cut hoop-poles, peel bark, and, though not yet able to use the whip-saw, broad-axe, and frow as his elders could, knew how to maul rails and split cord-wood as well as any body. But these he had only been used to do in a desultory way—it will not do to say an idle way. By birth and from habit he was averse to all steady, persistent, long-continued exertion of body or mind, such as alone can subdue the original wildness of the human animal, and civilize and develop him. In the United States more than a million like him are to be found. They gather themselves upon hilly, mountainous, and other barren soils, where the cheapness of the land renders its ownership or possession easy to acquire, and where they can, therefore, be their own masters. More than the gypsies of Europe they spurn control and love freedom; for they have no ancient customs to trammel them, and every family loves to be both independent of and remote from every other. Their religion is usually Methodist, and their politics Democratic. They are—those of them, at least, who are found in the hill country of the Ohio—of full size, strong, and handsome in face and form. They move with erect and graceful carriage, and fight bravely, as every field of the late war can tell.

Now Bob was aware that to escape with his pet beyond the reach of danger he and it must leave the creek country and go where, if he obtained any employment, it must be on condition that he should work

from morning to night, and six days in the week, like any common civilized drudge; and he was loath to submit to either the degradation or the inconvenience. He finally compromised with himself by resolving to follow a life of labor only while it should be absolutely necessary, and that, as soon as he should have grown to a man's estate and the colt to a horse's, they would both return and dwell together in the happy valley. Having thus resolved, he only delayed to catch and put a halter on the destined companion of his journey, and make of the trappings its mother had worn a bundle convenient to sling over his shoulders, and then he departed on his way without a word of good-by to father or mother. He had not, however, gone far before he stopped, as if suddenly remembering something he had left behind, flung down the bundle, tied the colt to a tree, and hastily entered the woods. When he came out again he held in his hand the photograph. He could not have gone without that. He placed it in one of the bags, and resumed his burden and his journey.

The first point he aimed to reach was the Ohio River, and though he had never yet seen it, he had learned the nearest way to go was by Churn Creek to the head of Lower Twin, and thence down the latter to the little village of Buena Vista, at its mouth. It was noon when he started off, and though the distance was over twenty miles, he would have traveled it before sunset but for the colt, on whose account he must move slowly.

JOHNNY MINGO.

JOHNNY MINGO was a black man. In making this statement, which I do deliberately and unqualifiedly, I wish to be understood literally; when I say "a black man," I mean a black man! His was no neutral tint, no mongrel, half-and-half, milk-and-molasses, coffee-colored complexion; there was no sort of sham about it, no modified compromise on Nature's part; no twilight mingling of light and darkness in his case. No! he was unmitigated *black*, and I say it not in any invidious or unkind spirit, for I liked him the better for it.

To me it was a type of his nationality, a mark of caste; it told of purity of race, of dusky aristocracy, that he was one of "the real old stock!"

And why not? Why should the Virginian boast of his "blue blood," and the honest African blush for his? Was not the vital fluid sent circling through the veins of each by the same Almighty will? And why should one be more ashamed than the other of his great Creator's handiwork?

Possibly, had I been born of African race myself, I might have learned to feel, as they appear to do, that

"One shade the more, one ray the less,"

would have been all-important to me in making up my self-estimate; but, as an outsider (as the term is), born of Saxon parentage, and originally of Saxon fairness, I, viewing the matter abstractedly, can honestly declare that my own preference is for the darker shades.

I like things true to their kind; I like *thoroughness*; and if a man is to be a black man, I like to see him come up to the mark. A white man certainly is to my eye a type of greater beauty than a black one: *so much* I grant; but I do not see that the latter gains any thing in being half of each: a pear is a finer fruit than an apple, but who would like an apple the better for being like a very poor pear?

So, to return to Johnny (our starting-point), he was "black as the ace of spades," and I liked him the better for it.

But, while defending my dusky hero on the score of color, I regret that I can not add, that though black he was comely,

"Like the maiden of the ancient Jewish song."

No! he was not comely; he was very much the reverse. He was of a gigantic size, standing six feet, and I forget how many inches—for he seemed too vast to be computed by inches—but he towered above all other men, and was stout and burly in full proportion.

Nature had been very liberal to Johnny in regard to quantity, without much respect to quality; she had thrown together the materials for his mighty frame with an unsparing hand, but she had not stopped to finish him off with that nicety of detail which she sometimes bestows upon her mightiest as well as her minutest handiworks. She had, possibly, been getting up elephants as her last job, and could not all at once turn her hand to a new creation; so, it should seem, she finished up Johnny Mingo "*à la elephant*," to phrase it elegantly—that is, she gave him enormous size, slow, clumsy, unwieldy, giant strength, half ignorant of its own power, and a blind, stumbling, obedient intelligence, less than reason but more than instinct.

His hands were immense, spade-like in size and shape, but with long, horny, knobby fingers that seemed too stiff to grasp any thing less massive than the stout cane, "like a weaver's beam," with which he always walked; and his enormous platter-shaped feet, heavy and round, pressed the earth in such a flat-footed way that it seemed as if, like the wet leathern contrivance which country boys call "a sucker," they must, in being lifted up, bring up with them the very stones and gravel upon which they had been pressed.

Johnny's features, too, were not typical of beauty; I mean of mere outward, physical beauty. His were the wide, protruding lips,

the flat nose, the receding forehead, the outstanding ears, the round, white, gleaming eyes.

You may think, perhaps, with all these condemning peculiarities, that Johnny must have resembled

"Some Indian idol, glum and grim."

But he did not, for he had an honest, kindly heart and a simple, childish faith; the coarse, hanging lips wore a friendly smile, disclosing the firm, snow-white, double teeth (double all round), which inclosed the great red, lisping, burring tongue, that seemed ever too large for the cavernous mouth it was meant to fill; and his eyes had a look in them—not the merry, devil-may-care look we so often see in the younger branches of the race—a look born, it may be, from ages of their aimless, reckless, hopeless, irresponsible condition; but something higher and more appealing; something of blind, dumb, waiting pathos; something that wanted words to tell how the dwarfed spirit within, ignorant of its immortal nature and glorious heritage, was calmly and humbly awaiting God's time.

Johnny Mingo's principal business was pig-raising. (You see we are not going very high in the social scale to place our hero.) His legitimate business was the rearing and keeping of pigs, for which, it is to be supposed, he had a decided talent, as his pigs always commanded a high price and a ready sale in the market; for all this, you must understand, took place long years ago, before the devil had been sent into the swine a second time, in the shape of *Trichina spiralis*; and roast sucking pig, roast pork, ham, and sandwiches kept the best society in town *then*, and were invited to the dinner-tables of the very first people.

So, as I have said, Johnny's main support came from the sale of his pigs, to procure a maintenance for which he was wont to perambulate the town, pushing before him a light hand-cart, in which he gathered from all the back-doors all the unmentionable accumulations of unthrifty cooks or thrifty housekeepers.

But as these daily peregrinations, and the diurnal applications of means to ends in the way of feeding, did not fill *all* his time, Johnny was wont to eke out his income by any odd jobs of work for which mere honest industry and brute strength would suffice.

To shake carpets, move furniture, dig drains, load or unload carts, saw and split and pile wood (for anthracite slumbered in its unsuspected wealth, and furnaces and ranges had not then begun to be)—these were Johnny's occupations, to which he was often called in preference to many a more boastful aspirant, for Johnny was always to be depended upon; and then at a raising or moving of a building his strength, with his

sturdy, stolid inertia, counted as equivalent to two pair of oxen at the least.

Johnny was not blessed in his domestic relations. That strange instinct or *fatuity* of human nature that seems to attract in these relationships the most incongruous characters, and bids opposites meet and mingle, had drawn to Mingo's bed and board a little, sharp, weazened creature, in person like a shriveled monkey, in nature like a gadfly. Her temper was viraginous, her voice a mingled scream and chatter, and her whole mission upon earth seemed to be to furnish a "thorn in the flesh" for her ponderous husband; but if *she* was a Xantippe in temper, *he* was a Socrates in patient, domestic philosophy. She was a stinging nettle in his sleeve, a bee in his bonnet, a bur in his skirts, a perpetual blister upon his shoulders; but the man's calm immobility and stolid patience bore him up unmoved: her best-aimed shafts struck his great rhinoceros bulk harmlessly, and dropped off brokenly. As he sat at his door-step she would buzz round him like an angry hornet, flinging at her unwieldy husband vituperative words and household utensils, whichever came first to hand, and frequently the word and the blow came both together; but Johnny never answered the one or returned the other. "Poor critter!" he said once, apologetically, to a by-stander, who expressed wonder at his quietude under a running fire of names and things—"poor critter! yer see, it *amuses* her, and it don't hurt *me* none!"

But once, when Nancy flung the hot flat-irons at his head, he said to her, calmly, "Narney! see he'ar, I'd druther you wouldn't do that are *ag'in*." And Nancy, awed perhaps by the unwonted severity of the reproof, did not venture to repeat the actual cautery application.

Johnny was not more fortunate in his children than he had been in his wife. He had three sons, but unfortunately they inherited, as is not uncommon, their father's physique and their mother's temperament. In vain Johnny tried to bring them up well, according to his light; to make them honest, steady, and respectable; but he could not do it. Strong, lazy, thievish, evil-tempered, and backed by their mother, who was always ready for mischief, they set him at defiance; and, lawless and dissolute, with a pack of useless snarling curs ever at their heels, they roamed the country round, robbing hen-roosts, orchards, and melon beds—a terror to the community; ever returning to their lair at their father's poor little home, which was invaded from time to time by the emissaries of the law, who tracked them there.

Poor Johnny appeared for them again and again, hopeful and pitiful, freely giving his poor, blundering eloquence to plead their cause when arrested, and his hard-earned money to pay their fines when convicted; but

it was of no use; they were past reclaiming; their misdemeanors grew more and more serious; and at last, grieved but despairing, he shut his heart and door against them, and let the righteous law take its course.

Johnny's little home—for it was only a poor little one-storied shanty—stood upon a piece of waste land just on the outskirts of the town; and here, when not called away either to provide for the wants of his porcine family or to answer the demands of some of his many employers, might old Johnny usually be found sitting near his pig-sty, contemplating his pigs, whether envying their domestic tranquillity, as compared with his own, or estimating their market worth, I can not say; but Johnny was a true child of Ham in one respect—he did not love work; not that he ever shirked it when it came to him in the way of his duty; but he did not love "work for work's sake," as many restless Yankees do; and his *dolce far niente* was to sit in the hottest sunshine he could find, and just watch his pigs, in melting idleness equal only to their own.

But it chanced that the board fence which was the boundary of Johnny Mingo's very limited domain was also the boundary fence at the bottom of a gentleman's garden—a fair domain, fruitful and flowery, stretching up to the back of a house which fronted on the best street in the town.

This house was not a palatial residence built of granite or brown stone, with great plate-glass windows and marble steps and quaintly wrought iron balustrades (such as every body who is any body must live in now, or somebody will whisper to every body that they are nobodies!), but a large, square, wooden, three-story house, painted straw-color, with green blinds; and with wooden pilasters, and door and window cornices painted milk-white—a house with stable and barn and coach-house and summer-houses and arbors! Such a house as the richest men in the country built and were well content to live in *then*, and dreamed of nothing better! And in this house lived one of the magnates of the town—a man who, being possessed of a secure fortune of a hundred and fifty thousand dollars, really believed himself a rich man! For in those days petroleum had not been struck, and California slumbered over her undiscovered gold, and the mad competition for getting and spending had not yet been kindled in town and country.

This gentleman, then, was such a blinded heathen as to be satisfied with his lot, retired from business, giving it up to younger and more needy hands, thought his house and garden good enough for any body, and really believed his Brussels and Turkey carpets, his brocade-covered chairs and sofas, and his huge richly carved four-poster bedsteads, with their gilded cornices and full

silken curtains, were all that the heart of man could crave, or that mortal ingenuity and taste could invent (this was in the dark ages, you understand); and this fossil individual actually ate and drank in glad content, and gave hearty thanks to God for his goodness to him, and dispensed freely of his goods to the poor and distressed wherever he could find them, just as if he had been a really rich man; and what more does a modern millionaire do?

This Mr. Lawrence was a widower with two children, a fine, bright, manly boy, who was at a boarding-school, and a little fair, curly-haired, blue-eyed girl of about five years, the solace and joy of his widowed life.

Little Annie, being early left motherless, and being a rather delicate child in her babyhood, was not kept under very strict control; in fact, she was permitted to do pretty much as she pleased, having never manifested any disposition to do any thing which she ought not; so she was allowed to play at her own free-will in the spacious garden, hedged in from all possible harm, and amidst the companionship of other growing things as innocent and lovely as herself. At her own free-will and pleasure Annie climbed into the fruit trees at the bottom of the garden, and helped herself as she liked to the great white-heart cherries, melocoton peaches, and the delicious greengages, and "St. Michael" pears, that seem to have passed away with those olden days.

Here, sitting at her ease upon some fruit-laden bough, Annie often beheld old Johnny tending or contemplating his pigs; and, at once attracted by his broadly good-natured laugh and repelled by his ugliness, an acquaintance sprung up between them, confined at first to the interchange of the daily greeting of, "Hullo, old Johnny!" on the one side, and "Hi, little Miss Annie!" on the other; but it was a growing season, and the shy acquaintance thus made grew with the other growing things of the year.

Johnny had the gift of song, so almost universal among his race, and often made the air ring with the musically rendered hymns, "There is a land of pure delight," and "When I can read my title clear;" and Annie dearly loved to hear him. Strange that the poor stammering, lisping, blundering tongue that tripped and halted over the simplest speech should glide over those musical notes without an error!

Then Johnny's pigs were objects of interest between them. As their intimacy ripened, Johnny grew confidential; he told her their names and their history, their traits of character; their individual virtues and vices were revealed to her; why this one was called "Greedy Boy," and that one "Sly Boots." And thus it came to pass that Annie's little curly head, crowned by a sun-bonnet in summer, and by a red and white

knit cap, with worsted balls bobbing round her face, in winter (for shade hats, nubias, and fancy rigmaroles were not then invented), might be seen almost any fair day surmounting the high peaked board fence, in earnest confabulation with old Johnny Mingo. And one *memorable* day Johnny lifted up the top of the sty, and showed her what he called "about the *hansermist* sight, he guessed, she ever *did* see!"

Oh, such dear, darling little pigs!—twins, triplets, quartettes—I don't know how many: nature is bountiful to mother pigs; and there they all lay side by side, like peas in a pod, white and shining, and their cunning little tails all twisting and curling, and their dear mamma grunting in proud and happy content.

Little Annie was delighted (all children love young things; they are in sympathy with their own youth), and never, she thought, was any thing half so pretty before! There was one especial *pigling* upon which her affections seemed to concentrate. "Oh, look at that one! it is such a dear, darling of a little piggie. Oh, if she *could* only hold him a little while in her own hands!" And old Johnny, grinning from ear to ear, took up the distinguished favorite, brought him to the fence, and, first wiping his dear little cloven feet upon the sleeve of his old jacket, reached over and put him into the extended arms of the delighted child.

That even "pigs are pretty, when they are *young*," has passed into a proverb; and Annie sat down on the fresh green grass and cuddled the little thing in her lap, patted its plump round sides, examined its merry bright eyes, pretty pink snout, and lightly twisted tail, smoothed its little pointed ears tenderly in her hand, and fairly screamed with delight when piggie got one of her fingers in his inexperienced mouth and began to suck it.

But the dinner-bell rang, and Annie had to restore the borrowed treasure. "He is a dear, darling beauty of a pig!" she said, as she gave him back to Johnny in a rather exhausted condition from the close embraces of her fat arms and warm little hands; "and I think you are a very good, kind man to let me hold him, and I like you real well." And Annie skipped away, little knowing how old Johnny's great loving heart leaped with joy at her simple words.

From that time forward they were greater friends than ever. Many a gaudy tulip or gorgeous dahlia, many a rosy apple or yellow musk-melon, many a cabbage or squash, many a Thanksgiving pudding or Christmas pie, was handed over the fence to old Johnny; and many a tinted sea-shell, or bunch of tropical fruit or foreign feathers, did Johnny pick up among his sea-faring friends (cooks, or stewards, or cabin-boys) for little

Miss Annie. And still, in and out, through all their harmony, blended the one key-note, the memory of that "*dear little pig!*"

Ah! the little pig had grown up long ago, and gone out into the world as pork and lard, as souse and bacon, but Annie did not know that. Johnny, with an instinctive delicacy of feeling that would have done honor to a gentleman, never told her that. "He had growed too big for the sty," he told her, "and so he had to sell him. He believed he had gone to sea."

He never told her that he went *piecemeal*, with a pork cask for a state-room; and Annie—little unsuspecting Annie—always thought of her early favorite as roaming at large in some fair foreign land, eating sweet acorns and chestnuts in the leafy shade of some grand primeval forest. And *why not?* Strip from life all the sweet illusions that gloss its hard realities, and who would care to live?

At length there came a change to Johnny. Nancy was taken sick, and she had a sore time of it; for the evil spirit that had possessed her "tare her" greatly before it came out of her; and Miss Annie—now growing to be a sensible little lady—sent in soups and broths and teas, all ostensibly for the comfort of Nancy, but in reality for regard to poor old Johnny, who had no rest, day or night, with her. One day he came to the place of meeting, peering over the high fence with a broad laugh upon his dark face.

"Well, Johnny; and how is Nancy to-day?" asked Miss Annie.

"The Lord he be praised, Miss Annie! Narney she's gone, sure and sartin!"

"Gone?—gone *where*, Johnny?"

"Oh, I dunno *whar*, Miss Annie; that are ain't my business. She's gone *dead*, as sure as you're alive!" said the widower, with a loud, ringing laugh. "Yer see, I telled her last night: I sez to her, 'Narney,' sez I, 'if yer don't die to-night, *I shall*, for sartin'—for yer see, Miss Annie, I was all tuckered out tending of her—and *she did*, Miss Annie; *she done it* jest as sure as a gun; and the towns-folks says they'll come this evening and bury her; and I'm resigned, Miss Annie. The Lord be praised!"

"But, Johnny, you will be all alone now, won't you?" said Annie, not just knowing how to treat the case.

"Yes, Miss Annie, thank you: the dogs is all killed, and the boys is all in the States-prison, and now Narney's took, and there's on'y the pigs and me—thank the Lord!" And Johnny, with a degree of *resignation* that might have seemed forced and unnatural to those who did not know the circumstances, went round to give his pigs (his sole remaining family) an extra feed, probably under some latent feeling that it was a sort of thanksgiving-day.

And it came to pass that at the next an-

nual spring cleaning, when Johnny came in to move the heavy furniture in the lower rooms, Miss Annie—now a young lady, who had just had a chamber fitted up anew for her by her father—invited her faithful and loving old follower up into her room to see a new picture she had just purchased. It was an oil-painting, and by a distinguished artist, but a strange subject for a young lady to have chosen; but Annie *did* choose it. It was a pig-sty, with the maternal pig and her little ones, just as Annie remembered them in old Johnny's sty in her babyhood. Great was Annie's pleasure in showing it, but still greater was old Johnny's pleasure in beholding it. Together they picked out the very individual little pig that Annie had held in her arms, and which Johnny said she had *kissed*. It seemed as if the old man could never leave it; and from that time the *actual* pig seemed lost in the ideal one, and all their memories of his early loveliness became enlarged and glorified.

The summer rolled on, and one hot night Johnny, who, not being an imaginative man, was seldom troubled by dreams, woke out of his sleep, which was usually one profound, unbroken slumber, with an odd sensation of being disturbed. "Seemed to him," he said afterward, in telling the story, "as if he kinder heerd a noise. For a minit he thort 'twas old Narney cutting up and thrashing round." In another moment a flash of blinding lightning nearly took his breath away, and then came an awful, prolonged, crashing peal of thunder, that seemed as if it must bring the very skies shattered down upon the earth. "Well, *there*, now!" said Johnny, satisfied that he had found out the cause of his unusual wakefulness, "*that* was it, no *doubt on't*; I thought I kind of heered a noise. That was a buster. Shouldn't wonder if that are struck somewhar!" As Johnny, all unmoved by the tempest, turned himself over to take up his broken slumbers, a faint cry of fire rose on the air, and, turning his eyes to the window, he saw the flames breaking out of Mr. Lawrence's house.

Johnny was habitually slow, but he did not loiter now; and as his habiliments were much the same by day or night, he was soon out of the house, and made his way to Mr. Lawrence's before the firemen did.

All was in confusion. He met a servant rushing from the house, and tried to stop him. "Whar is Miss Annie?" he shouted.

"I don't know," cried the man, breaking from him. "I am going for the engine. Do not stop me."

He arrested another. "Whar is Miss Annie?"

"I am going to tell them to ring the bells. I do not know."

Johnny hurried on. Nearer the house stood two or three of the inmates, wildly huddled together in their night dresses, apparently

bewildered with fright. Johnny rushed up to them; again the unvarying question, "Whar is Miss Annie? Tell me is she safe?"

"O Lord!" gasped the man he held by the shoulder, "I'm afraid not; I haven't seen her. The lightning struck on that side of the house, too."

Johnny uttered a great cry, and flung him aside as if he had been a snow-ball, and pushed on. There was not a moment to lose; the flames were breaking out. He pressed on; he entered the house. Ah! well that he remembered the way. The mere animal instinct of memory which he shared in common with the brute creation served him better here than intellect could have done.

He mounted the stairs; the air was stifling with smoke, and quivering with red heat; but the hungry flames lighted his way, and he never faltered. Up, up, till he reached the remembered chamber, and, with instinctive respect, knocked at the closed door.

No answer. He tried the door; it was fastened within. But the danger was near and pressing; there was no time for ceremony. With one blow of that sledge-hammer right hand, one effort of his great brute strength, he burst it open, and Annie, his little Miss Annie, was before him.

She had risen; and there, at the foot of her bed, in the middle of the chamber, she stood, dressed in her white night robes, with the spiral jets of smoke already curling up about her little naked feet.

There she stood, motionless, helpless, ghastly pale, with her despairing hands clasped above her head, and her wild eyes fixed strainingly upon the window, outside of which the red banners of flame were already waving!

There she stood, mute, bewildered, stupefied with the sudden and awful peril; forsaken, forgotten, left there all alone—*alone—to die!*

"Miss Annie!" called Johnny; but she did not hear him, for the sound of the fierce rushing flames was in her ears. "Miss Annie! little Miss Annie!" he shouted, advancing into the room. Annie heard and turned, recognizing her old friend, held out her entreating arms to him, and sunk upon the floor. Johnny did not know whether dead or alive; but, hastily snatching a woolen blanket from the bed (what Heaven-directed instinct taught the poor ignorant creature that wise precaution? possibly it was only his blind, instinctive reverence for Annie's delicacy), he wrapped her in it from head to foot, and then, lifting her in his arms as easily and as tenderly as if she had been an infant, he retraced his perilous way.

Already the flames had made fearful way; already the stairs were burning beneath his tread; but his great, heavy, ponderous feet seemed literally to trample down the fire. Already the long-tongued, quivering

flames reached down from above, and singed his hair, and scorched his cheek, and fastened upon his sleeve; but he never faltered! Miss Annie, his precious Miss Annie, was in his arms; and, true to the trust, he never flinched or turned from his way until at last, choking, coughing, panting, smoking, and burning, he emerged into the open air. Ah, the clouds had broken then, and a welcome deluge of rain quenched his burning garments.

Staggering from the house, Johnny stopped just long enough to fling back the blanket from poor Annie's death-pale face—*she breathed!*—and he plodded onward till he reached his home, and laid his prize, his rescued Miss Annie, still enveloped in her blanket, upon his own miserable pallet, and went for the doctor.

When he returned he found Annie quite recovered, and sitting up.

"Oh, Johnny, Johnny!" She held out her hands to him, but could say no more.

"Oh, Miss Annie! Bless yer, bless yer! And ain't yer burned, not a mite of yer? *Ain't* she burned *none*, doctor?"

"Not one bit, my brave fellow, thanks to you!" said the doctor.

"Not a bit! not a bit burned! Jest as good as new! jest as good as new!" said the delighted old man. Then, reeling as he spoke: "Yer'll scuse me, Sir, if you please, if I jest make free to sit down a bit. Yer see, it's been a kinder broken night with me—and I feel—sorter tired like." And then the iron strength gave way; and murmuring "Good as new! good as new!" he sank, fainting, into his old arm-chair.

"Why, Johnny, my poor fellow, you are badly burned yourself! See here!"

Johnny did not speak; and the doctor, carefully cutting off the coarse sleeve, showed the poor black arm—the strong right arm that had carried Miss Annie so tenderly—burned from the shoulder to the wrist.

We need not pause to tell of the skillful care of the doctor, of Annie's tender ministrations, or the substantial gratitude of her father, who was away from home on the night of the fire. How he enlarged and repaired Johnny's little shanty, and hired a respectable colored woman to keep house for him, and surrounded his last years with every possible comfort.

Mr. Lawrence's own house had been saved by the timely fall of rain and the vigorous exertions of the fire department; but Johnny never ceased to regret that he could not have saved more, particularly "the pieter of them little pigs."

"I did kinder look round for them little pigs," he used often to say; "but, yer see, I wor feared for Miss Annie, and I daren't stop for the dear little critters."

Every day during the rest of his life old Johnny made his appearance at Mr. Law-

rence's house; and every day, when she was not ill or out of town, Miss Annie went out to see him, and talk pigs with him. But gradually his simple mind failed, though his giant strength remained unbroken; and at length there came a time when their daily interview dwindled down to the single repeated question, "Miss Annie, you remember dat are pretty little pig, don't yer? warn't he a real little beauty?" At last Death came upon the good old man, stealing a march upon him as he sat at his door dozing in his old arm-chair; and he went away to that better land, where we trust it is not uncharitable to hope old Nancy was *not* awaiting him; and Miss Annie, though she could not regret his death, wept tears—real, sincere, tender tears—over the kind, simple, brave old man who had risked his own life to save hers.

Annie is a mature woman now; a wife and a mother; but she has never forgotten those early days. And often when she gathers the little ones around her, at the mother's own hour, the hour of twilight, they will ask, with childhood's love of repetition, for the oft-told story of old Johnny Mingo and the little pig.

And Annie tells them the old, reiterated story; but she never tells them how he looked (she had his photograph taken once, but tore it up; for she said she would rather remember him by the *white soul* by which she hoped to recognize him hereafter). So she has never told them of his great protruding lips, his retreating forehead, and great, lisping, burring, bothering tongue; but she tells them of his kind heart, his simple faith, his truth and bravery—of his giant strength, his pleasant songs, his love and devotion to her.

And so the children, catching the mother's enthusiasm, always think of him as "mamma's dear old Johnny Mingo!"—a dusky hero, tall and stately—a very suitable subject for a pleasant story, but not one bit like the *real* old Johnny!

Ah! *love, romance, and time* can deify the simplest object. Thus Johnny and Annie deified "that little pig;" and thus, in their turn, Annie's children have learned to deify old Johnny!

THE FIRST AMERICAN EXPLORING EXPEDITION.

THE origin of the first American exploring expedition is scarcely known outside of the archives of the government, and yet its bearing upon the extension and influence of our commerce, and the acquisition of scientific knowledge, has been incalculably important. For more than forty years after the adoption of our national Constitution the United States were, for all maritime and scientific knowledge, wholly dependent on

foreign governments. We had not contributed a dollar for the promotion of scientific intelligence, we had not constructed a mathematical instrument, and our ships sailed by charts we had no hand in making. Our national vessels had sailed around the globe, but no record of a laborious scientific research existed. Our naval fleet was uselessly kept up in the Mediterranean to contract the follies and vices of European aristocracies, instead of being engaged in pointing out harbors for our seamen, to save them from captivity, shipwreck, and famine on unknown coasts. We had not spent a dollar in aid of geographical and commercial information, except in partially exploring our own territory, and we actually conducted our *prizes* into ports by the maps and charts of the people we had vanquished! The English, French, Spanish, Neapolitan, Norwegian, and Barbary powers had cheated and insulted us; they laid out their milestones and guide-boards, and kept us in lead-strings.

Our commerce had extended every where since we became a nation, but was protected nowhere! Spain even, with her exclusive system of monopoly, had shamed us by her geographical contributions. The Italians and Portuguese, the Danes and Norwegians, had all ventured into unknown seas, and planted colonies on far-off shores. The torrid zone, supposed to have only sandy deserts and a vertical sun, was found to teem with animal life and with a denser population than the temperate zone. The frigid, too, navigators had seen in its partial summer and blooming flowers. Russia had made discoveries in every part of the globe, even to the northwest portion of our continent, and into the Southern Ocean as far as the seventieth parallel of latitude. England, however, maintained pre-eminence in her scientific explorations. She had sent King to Magellan, and Owen to Southeastern Africa; had constructed charts for the almost unknown passage to the Pacific, and for three centuries had never relaxed in efforts to find a northwestern passage. Thus we stood in humiliating contrast with the whole scientific world at that day, when an American citizen appeared, to elevate by his singular scientific intelligence the character of our people, and to equalize our condition as a nation with the governments of the Old World.

James N. Reynolds, a native of Ohio, but subsequently a citizen of New York, was the projector and founder of this great national enterprise; and although the expedition was shorn of much of its original design by the treachery of incompetent government officials, it has, nevertheless, been pregnant with the most beneficial results to this country. The act of Congress authorizing the exploration, passed the 14th of May, 1835, and by the concession of Congress and the

country, was due to arduous labors of this single man. The Geographical Society of England was in session when the news of this contemplated expedition reached Europe, and at once it awakened the deepest interest; and, seizing the vast amount of information Mr. Reynolds had brought to the attention of our government, England and France both fitted out expeditions similar to ours, and very soon the *Lion*, the *Lily*, and the *American Eagle* were seen in the same constellation, and the ensigns of France and the United States made the southern continent the same day! Mr. Reynolds had traveled around the circumference of the earth, and his experiences as a navigator were extraordinary. With an ardent love for his country and its institutions, he was grieved to find our American libraries filled with maps and charts and histories of what science had done for other nations, and nothing to show for ourselves. And at the very same time we had a tonnage greater than all Europe combined when Columbus discovered America, and a more effective navy than all the world together at that period.

The hardships endured by our early settlers very soon made them familiar with the ocean, and able to compete with England in this respect. Six years before the Pilgrims landed on Plymouth Rock John Smith coasted from James River to Portsmouth, and surveyed all the islands and harbors of New England. When the Pilgrims arrived, in 1620, they went to work and built ships to survey the Southern coast, and traffic with the natives, and in less than fifty years after, the tonnage of America was great enough to excite the jealousy of England. In 1665, when Massachusetts had a militia of only four thousand, she owned one hundred and forty vessels of between twenty and fifty tons burden. So of New York: the first thing done by her colonists was to hollow a tree to cross the adjacent waters and commune with the settlers. Maritime enterprise has been the earliest characteristic of the American people, and drew the sea-farer and emigrant to the Atlantic shores. The Indians prowled around the emigrants' doors at the beginning of the seventeenth century, so that the necessities of life were scantily raised; but expeditions were busy in ascertaining the indentures on our coast, its rivers and harbors. The *fisheries* were then the chief source of enterprise, and from them, in connection with the *fur* and *lumber* trade, this nation received its first impulse of progress, and began to develop its resources.

This maritime enterprise in America soon excited the envy of France against England, and was the primary cause of the first and second French wars, when America became the common battle-ground. The American privateers were then the pride of the mother country; and these wars were the trying or-

deal by which the American people were trained for the battle of *independence*. In that struggle nearly two thousand vessels were captured by the Americans. In no other way could we have prolonged the conflict with England, because by no other means could we have obtained at that day the requisite material and munitions of war. Washington said, in the very crisis of the struggle, that but for our *privateers* he would have been compelled to disband our forces. At one time, when besieging Boston, there were but two barrels of gunpowder for twenty thousand men, when two English ships, laden with military stores, came in sight, and were captured by Captain Manly, and applied to our use.

After the war of independence we had no navy for several years, and our maritime affairs were managed by a *committee*. As colonists we evinced greater spirit in behalf of our American commerce than after we attained our nationality. From the war of independence to the war of 1812 not a dollar was expended for its advancement, with the exception of a small sum for an expedition to the Rocky Mountains. During the French revolution, when all Europe was in arms, the American people got possession of the entire carrying trade, and this gave an impetus to our greatness and wealth without a modern parallel. England and France both became jealous, and this led to exactions on our commerce in 1806, which were followed by the Berlin and Milan decrees in 1807, causing non-intercourse, and resulting in the war of 1812. Our navy, though then small, won great glory on the seas; but we emerged from the conflict with a weak commercial marine.

But, the war over, commerce again took its onward march. Our fisheries extended from our coasts to the shores of Brazil, around all the capes of the Pacific and Indian oceans to the Maldives and islands of Japan. *Cotton*, which had been introduced several years as a botanical experiment, then became an object of primary importance. From that period manufactures began to influence the national economy. The *sugar* of the South and *flax* of the West came into general use. Internal improvements soon developed new markets for all articles, and placed the necessities of life within the reach of all. The people of the interior sought the commerce of the sea-board, while the traveler of the sea-board penetrated the interior, and thus opened up our resources.

The importance of the exploring expedition which forms the subject of this paper was first brought to the attention of Congress as early as 1826 and 1827, when Mr. Reynolds's application was seconded by memorials from seven of the States, signed by all the officers of their respective Legislatures, prominent among which was that of New

York. A committee of Congress was appointed to consider and report on the *novel* project, as it was then called; but the press throughout the country sustained it without exception, and discussed it widely. The commercial interests, particularly those engaged in the *fishery, whale, or fur* business, supported it with zeal. The memorial from the inhabitants of Nantucket set forth with admirable force the necessity of commercial protection in the Southern Ocean.

Congress, being near the close of the session, voted a *resolution*, instead of a bill, affirming the expediency of sending one or more of our small national vessels into the Pacific and South Seas, and requesting the President of the United States to allow such facilities to the Navy Department as would make it effective. These resolutions reflected the sentiments of all the great commercial cities and the Legislatures of the States comprising more than half the population of the Union, and represented by one hundred and twenty-nine members on the floor of Congress. Hon. Samuel L. Southard, then Secretary of the Navy, did all that prudent foresight could suggest to make it a useful and honorable enterprise. The *Peacock* was fitted out, and officers of skill directed to be in readiness. Books and mathematical instruments were ordered, and scientific counsel was sought by means of correspondence. The next meeting of Congress the bill, reported by the preceding one, passed by a large majority in the House; but a discussion arising upon some of its details in the Senate, Congress adjourned before action was taken by that body.

This was at the close of President Adams's administration. Governor Branch, of North Carolina, went into the Navy Department under General Jackson, and, under the party watch-word of "retrenchment and reform," the expedition was suspended. Then it was that Mr. Reynolds went abroad and gave *five years of his life* to the circumnavigation of the globe. He confirmed, by personal investigation, all the information previously derived from others, and with a conviction that honor, interest, duty, and humanity called for this national enterprise, he returned to the United States in 1834, and renewed his labors before Congress, which were happily successful.

Our American *whalers* had for more than thirty years furnished valuable information to the European constructors of maps and charts, without ever receiving the slightest recognition or acknowledgment. It had been their custom to inform whatever vessels they might chance to meet of new reefs, new islands, or new dangers they had discovered, and the annals of no other nation show the same daring and successful enterprise that has been presented by the silent, unobtrusive action of our American fisher-

men. From this source Mr. Reynolds sought for information concerning the whole range of seas from the Pacific to the Chinese and Indian oceans. In like manner he availed himself of the experience of those still more adventurous and daring men at that period engaged in the *seal* trade. In the smallest vessels these brave men swept the shores of Patagonia, the islands round Cape Horn, and the whole coast of South America. They skirted the eastern and western shores of Africa, they circled the islands of the Pacific, plunged into the Southern Ocean, and were often close to the limits of the antarctic circle.

When the Emperor Alexander sent out two ships of discovery they became on one occasion involved in a fog between the South Shetland Islands and Palmer's Land. To their great astonishment, as the fog dissipated, they descried a small vessel of fifty tons burden between their ships, with the American flag at the mast-head! The Russian commander hoisted his colors, and sent an invitation to the American captain to visit his ship. The commodore inquired their present locality.

"You are in sight," said the American captain, "of the South Shetland Isles; and if you wish to visit any of them in particular, it will afford me pleasure to be your pilot."

"We were congratulating ourselves until now," said the Russian, "that we had made a *discovery*; but we must surrender to you Americans, and be content to follow you."

Captain Palmer was that American, and Stanjy Rouitsch the Russian commander, who was so highly impressed that he named the coast *Palmer's Land*, which still remains upon Russian charts, though in 1831 a British vessel touched at that spot, and substituted an English for the American name. In 1835 the danger to which so large a class of citizens were exposed from shipwreck on seas, on coasts, and among islands, with no charts to guide them, and their frequent massacres by savages for want of maritime power to enforce respect, had become very alarming.

Only a few years previous, from the want of a chart, the frigate sent by our government to rescue American citizens at Sumatra was run ashore before knowing she was in anchoring distance. Our merchants were allowed by the English and Dutch almost exclusive monopoly of the commerce of the Sunda Isles, when, at the same time, there was no chart by which to sail a United States vessel! The capture, in 1831, of the *Mentor*, belonging to New Bedford, was the result of the culpable negligence of the government toward seamen. The Pelew Islands, against which the vessel struck, were not then on any chart. Whole groups of islands, like the Galapagos, were not to be found on

any charts; so that our whalers were continually prey for the natives. Our consul at Oahu wrote at that time to Commodore Downs that fifty or sixty Americans were confined in the fort, and not a whaler entered without mutiny and desertion.

Mr. Reynolds urged the importance of sending an enlightened body of scientific men and naval officers to remedy all these difficulties—not by merely attaining high southern latitudes, but to *explore* from the west coast of South America, running down the longitude among the islands *on both sides of the equator*, especially south, to the very shores of Asia.

At the time this exploring expedition was projected there were more than one million and a half square miles that had never felt the foot-print of man, nor had the keel of a navigator divided its waters. Captain Cook and Lieutenant Freneau had made a voyage in search of a southern continent. They got as far as sixty-eight degrees of south latitude, and retreated in pursuit of northward discoveries. Mr. Reynolds would have instructed Cook to have selected another meridian, and continued his journey south, as *he* had proved that the same ice came from larger islands east of Palmer's Land.

Cook made a second voyage in search of southern lands, but again, in 1773, was arrested by ice. He then declared that, in his opinion, the mass of ice extended to the pole!

In 1832 Briscal was sent out from London in a whaler in search of southern land, and the land he took in the name of the sovereign had been visited *fifteen* years previously, and *furs* taken therefrom, by our own navigators in the American name.

As soon as the fact was settled by law of Congress that the expedition would be undertaken, scientific men throughout the country turned their attention to it, and manifested by correspondence extraordinary zeal for its success, and urged that the best talent of the nation should be enlisted in its conduct. They insisted that the age had too far advanced to be satisfied with an amended chart; but to satisfy the expectations and hopes of the country every branch and every department of science should be appropriately investigated by the expedition.

Another problem which this first exploring enterprise was calculated to solve was the source of the aboriginal population in America. Strong hopes were entertained that some one, through these means, might explain it. Mr. Duponceau, our countryman, had already taken the prize medal at the Royal Institute of Paris for his essay on the original languages of our country. *Facts* alone were needed to bring to philology the prestige Cuvier had given to zoology, and these facts could only be had by studying the *unwritten* languages of the earth. It was a favorite theory of the late Professor Charles

Anthon, of New York, that the early races of the American continent were identical with those from whence the inhabitants of the South Sea Islands have descended. The mummies found in the caves of the West, with their fabrics, strongly resembled those of the Sandwich and other islands of the Pacific; and he strongly concurred with Mr. Reynolds that the expedition might throw new light upon this most interesting question.

The bill authorizing the expedition was carried by a very large majority in the House, headed by John Quincy Adams. Professor Josiah Gibbs, of Yale College, seconded the effort to secure an anthropologist and philologist, that the moral and religious impressions of the people, as well as the sound of language, its radical words, etc., might be investigated.

The Nantucket memorialists stated that there were one hundred and fifty islands known to them, around which floated nearly forty thousand tons of shipping, that were not to be found on any chart; and that there were thousands of islands laid down *incorrectly* on the charts.

The expedition should have been equipped and ready to sail ninety days after Congress authorized it; but the preparations occupied three years. Although President Jackson favored it, his Secretary of the Navy was privately opposed to it, and threw every possible obstacle in the way of its success. Mr. Dickerson belonged to the Southern school of politicians, who *denied* the right of the national government to interpose for science and humanity. Aware of hostility from this class of Southern men, Mr. Reynolds was careful so to project it as to make its national and commercial ends of primary importance. Dickerson did his utmost to defeat the law of Congress, and created a commission thirteen months after its passage, ostensibly to devise means of carrying out the expedition, but really to thwart it. In the mean time France, acting upon the information furnished by our government, had equipped and sent *three* well-appointed expeditions to the South Seas, and was in preparation for a *fourth*, before any sincere movement had been made by our government. The Navy Department clique hold up the enterprise as an encroachment on the rights of navy officers to have a corps of scientific citizens accompanying the expedition, and called this class mere clamcatchers; and in spite of memorials, committees, remonstrances from members of Congress and the press, obstacle after obstacle was presented to defeat the object designed. Every thing was done to impress the people with the belief that an enormous expense would attend the expedition without any compensating good—that it had nothing to do with protection to commerce, but was only

to explore high latitudes south! At length the attention of General Jackson was called to the effort of the Department to bring discredit upon the matter, and especially by the non-appointment of the civilians who were to be connected with it. He summoned the secretary, and three days after the scientific corps was duly commissioned. The secretary excused the delay on the ground of a want of funds. The President ordered an investigation, when it appeared that one hundred thousand dollars were yet unexpended. Instead of consulting men of science in this country as to the proper books and instruments required, Mr. Dickerson sent Lieutenant Wilkes as agent to Europe to procure them, and he, not having any special fitness for the trust, brought back, as the records of the Department show, two astronomical clocks, one astronomical telescope, and forty-one chronometers, when the fact was notorious that our American workmen had then arrived at as great perfection in the construction of these instruments as any to be found in the world. As to the books, there were but ten that had any bearing on the expedition. Fifteen more months then passed away before the proper books and instruments were obtained.

This being the maritime enterprise in which we as a nation were to make our *début*, the projector had planned it to a high degree of perfection, and was the only person capable of pointing out the places for general rendezvous; but the Department clique had resolved that he should not accompany the expedition. In 1837, taking advantage of the financial crisis, they convoked a new commission, composed of Commodores Hull, Biddle, and Aulick, to cut down its force. Without visiting the squadron, or informing themselves as to the real objects of the enterprise, these commissioners reported favorably for the secretary, and recommended the *Peacock* instead of the *Macedonia*, and a reduction of the minor vessels. This at once attracted unfavorable notice here and in Europe. Commodore Jones, who had accepted the command, became discouraged, and resigned it on the 30th of November, 1837. It was next tendered to Commodore Shubrick, but the vessels did not please him, and he declined. Then it was offered to Captain Kearney; but in the mean while the misapplication of the funds, the change in the vessels, the efforts to create discord, the delay of reports, the withholding of information from Congress, and the indecision and inconsistency shown in shelving the friends of the enterprise and rewarding its enemies, compelled the Executive to transfer the control from the Secretary of the Navy to the Secretary of War, Joel R. Poinsett, who proved to be as hostile to the movement as ever Dickerson had been. Poinsett would not per-

mit Kearney to take the command, but appointed all known enemies of the expedition. Captain Gregory was tendered the position, but when it was ascertained that he was a friend of Mr. Reynolds, and wished him to accompany it, means were used which forced him to withdraw rather than compromise his self-respect. An insincere tender was again made to Captain Joseph Smith; but at last Lieutenant Wilkes, who from the beginning had been the "coming man" for this command, received the appointment over the heads of Captains Kearney, Smith, Gregory, Kennen, Armstrong, and Aulick; and, as though it was not enough to have so elevated him, the reason assigned was that none of the officers named had the requisite talents! A general order was issued on the 22d of June, 1838, declaring the expedition purely *scientific*, and leaving the President to select a commander without regard to previous rank. Congress was deceived by Poinsett and Company, and supposed the expedition had been reduced on economical grounds, when the documents proved that the *Macedonia*, with thirty-six guns and three hundred men, was withdrawn, and the *Peacock*, *Vincennes*, and *Porpoise*, consisting of fifty-six guns and four hundred and sixty men, placed under the command of Lieutenant Charles Wilkes.

The comparison between the *good* and the *bad* plan completely disheartened the friends of the enterprise, particularly the treatment of the eminent scientific corps, upon whom Wilkes laid his hostile hand after they had made, *under the plighted faith of the government*, every preparation to sail with the expedition. In the judgment of this commander, who acted under the direction of Poinsett and Company, several of these gentlemen were declared useless incumbrances, and were not permitted to engage in it. Among these, to the astonishment and regret of every friend of the enterprise, and in defiance of the known wishes and requests of members of Congress and the ablest scientific men in the land, Commander Wilkes declared that, for the sake of harmony, the *author* should not be allowed to accompany his expedition in any capacity, public or private; and to prevent the possibility of his doing so, the flotilla hurriedly sailed. But the triumph of Mr. Reynolds was not the less complete. He shed unfailing lustre on his country, and thereby became the beacon-light which has illumined the pathway of scientific exploration ever since. To the men of science who accompanied that great enterprise honor and praise are due, and despite all obstacles, they made an imperishable record of their fidelity to their high trusts. Lynch's exploration in the Dead Sea, Fremont's in California, Dr. Kane's and his followers' in the arctic regions, are some of the outgrowths of the first American expedition founded by Reynolds.

THE OLD NORSE COLONIES OF GREENLAND.*

OUR OOMIAK AND CREW.

A Greenland Missionary.—A novel Boat.—Up a Fiord.
 —The Norse Ruins at Krakortok.—The Northmen in
 Greenland.—The last Man.—A disconsolate Lover.
 —A lively Day.—Mosquitoes.—A Sunday in Green-
 land.—A Greenland Parliament.—The Danish Ship.
 —Hopes and Fears.—A Ball and the Belle of it.

I HAVE rarely passed a more pleasant evening than one which I spent in July, 1869, with the Rev. Mr. Anthon, pastor of the mission at Julianashaab, near the extreme southern point of Greenland. The parsonage, in which we sat, was enlivened by the presence of the missionary's family, consisting of his wife, sister, and two bright children. Through the window-panes we saw the sunlight glowing on the mountain-tops, even to the middle of the night, and illuminating the solitary little town that nestles there among the barren rocks, beside the fiord of Igalliko (meaning "the fiord of deserted homes"), anciently known as Ericsfiord.

We were on historic ground, and naturally enough our conversation ran upon the events of the past; for here, to this very spot, came Red Eric, the Northman, and his followers, in the year 983, and along this very fiord, which extends forty miles in a northeasterly direction into the country, were once scattered the hamlets of the adventurous men who founded a nation on these arctic shores, and made the country famous as "the island of Greenland, the remotest boundary of the habitable globe."

But now the single modern town of Julianashaab supplies the place of numerous villages of the ancient time. A few hundreds of the descendants of a savage race, ruled by a mere handful of Danish of-

ficials, now obtain a precarious subsistence where once lived many thousands of hardy Northmen, who, after adopting the Christian faith (living undisturbed by the elements of discord which afflicted the civilized world elsewhere), maintained a peaceful existence for a period of four hundred years, when they passed away, leaving only a few meagre records of their growth and their ruined dwellings to tell of their decay.

These ruins we were desirous of visiting, and Mr. Anthon kindly offered to take us there in his *oomiak*, which is the only native boat of the country except the small canoe, or *kayak*. This latter is for one person only, and is exclusively the man's boat, while the former is the woman's, being rowed only by women, a man sometimes steering, but never taking an oar to pull.

It is not at all likely that the reader will ever have occasion to construct one of these ingenious specimens of marine architecture; but it is worth his while, perhaps, to know how, for there is nothing like it elsewhere, and it is always interesting to observe how men overcome difficulties; so I will describe the process in detail.

First you will obtain from the Danish governor's stores a great many small strips of light wood, which you will proceed to carve, and then bind and lash together, until you have constructed five poles, or rods, as nearly round as you can conveniently make them, about two inches in diameter, and, say, thirty-six feet long, provided that should be the length you have decided upon for your boat. The lashings are all made with raw seal hide, and the wood has been all brought from Denmark, for no trees worthy of the name grow in any part of Greenland.

Having secured your five rods, you proceed

* *The Land of Desolation: Being a Personal Narrative of Observation and Adventure in Greenland.* By DR. ISAAC I. HAYES. New York: Harper and Brothers.

upon these to form your boat. Three of them become keels, and two gunwales. To them are lashed ribs of wood or bones of animals, as the case may be, and you have an elastic, though very substantial, skeleton, over which you will draw a covering of tanned seal-skins, that the native women have sewed together for you with sinew thread in a manner which makes the seams as entirely water-proof as the hide is. This covering fits the skeleton like a glove upon the hand, and is firmly fastened to it. Not a peg or nail has been used in the construction of this novel affair; but you have a buoyant and serviceable boat, when all is done, that is thirty-six feet long, six feet in breadth of beam, two and a half feet in depth, nearly flat-bottomed, and sharp at both ends. Four men can readily lift and carry it, and when inside of it and afloat upon the water, you will see the skin bulging in between the ribs of the wooden skeleton; you will also observe every ripple of the water through the very thin covering, and you will be very likely to think, as we all did when we got into the pastor's boat, that it is rather a ticklish craft to go to sea in, for it was such a craft that Mr. Anthon brought in which to carry us up the fiord.

We were well pleased, however, after the first sensation of insecurity wore off. Our oarswomen, six in number, were not by any means unattractive in personal appearance, especially the "bow-oar," whose name was Concordia. Maria was the "stroke." We called them the "Arctic Six."

And the "Arctic Six" took us at a lively pace up the fiord, past picturesque slopes of green, relieved by frowning cliffs, above which rose snow-clad hills. The sail might have been at times tedious had it not been for the timely interference of a young gentleman of our party who had come out to Greenland to enjoy himself, and who did it accordingly. It is always pleasant to see people do what they undertake to do.

This young gentleman bore the name of Prince; but whether that name was natural to him, or whether it was, as some asserted, applied on account of some fancied resemblance to the Prince of Wales, or whether on account of his being the prince of good fellows (which is far more likely than all), is not important; but Prince he was, and like a prince he treated the bow-oar, who was a half-breed, and was very pretty. He knew that the first duty of a young man is to admire a pretty girl, and accordingly he sat beside Concordia on the thwart, which resulted in a great deal of sport between the parties immediately concerned, a great deal of amusement to the rest of our party, and a great many tokens of indignation from the other five women; for the Prince insisted upon helping Concordia at her oar, much to the confusion of Maria, the stroke, who had no similar attentions.

This would all have been very well had it not been for a youth named Marcus who accompanied us, and whose heart beat a troubled discord in the confinement of a native kayak. The unhappy possessor of this discordant heart was, like Concordia, a half-breed, and had been baptized. He was a fine-looking fellow, with brown hair and eyes, a frank, open countenance, the complexion, though not the features, leaning rather to the darkness of the Esquimaux than the lightness of the Dane. The only trouble with him was (and this appeared to distress him much) that he loved Concordia. Judging from the magnitude of his distress, he must have loved her greatly.

Marcus was a great favorite with his pastor, whom he always accompanied upon his journeys. His duty was a simple one enough, but a very necessary one, as boating is performed in the Greenland fiords. It was to paddle along beside the oomiak in the capacity of courier, if occasion made it necessary to use one, or, in case of need, to act as outrider—two functions which at once suggest the dangers of oomiak navigation. Suppose, for instance, the boat is caught in a heavy blow, and is broadside to the wind; ten to one that it will be blown over, owing to its lightness. Marcus is near at hand, and prevents a catastrophe. He pulls up quickly alongside, seizes the gunwale of the oomiak, and bears his weight upon it. Again, the oomiak runs against a sharp piece of ice, which the steersman has not seen in time to avoid. A hole is cut in the skin, and in rushes the water. The boat is headed for the land, and the pastor and his ladies get ashore with their lives. But where shall they go now, and what shall they do? They are very likely to be on an island, or, if not, they will very probably have to scale a mountain and descend again before they can reach a settlement. Marcus saves them this labor, and very likely saves their lives too, by flying away in his fleet kayak and bringing succor.

Twice during the day it seemed to me that we had met with an accident of this nature that would prove fatal to our plans, if not to our lives. The skin of the boat was cut, and the water entered, but the circumstance caused no alarm. The cuts proved to be small, and one woman only left her oar to repair them. This she did, and very speedily too, by thrusting into the cut a small piece of blubber, which answered every purpose until we reached a convenient landing-place, when the boat was drawn up on the beach far enough for the women to get at the hole with needle and thread, when a patch was quickly put over it, and the skin was as good as ever.

That Marcus was jealous of the Prince (our favorite as well as Concordia's) any body could see with half an eye. But a kayak is a most inconvenient place for a jealous lover,

for it is only a little over a foot wide, and it does not weigh half as much as the man himself. If he meditates mischief to his rival he is in a very dangerous place, for the least indiscretion in his movements, or the imprudent withdrawal of his eyes from his cranky boat, would very likely cause him to find himself suddenly floating, head down, with his kayak, bladder-like, fastened to his heels—a position that would very speedily cure the most ardent lover in the world of the highly ridiculous passion of jealousy.

Compromising, therefore, between the impulse of jealousy and the restraints of prudence, Marcus paddled close to the forward part of our oomiak, where the Prince and Concordia were seated, as if he would overhear their conversation, and thus possess himself of some remark of the fickle lady to treasure up against her, as if thus the more effectually to destroy his peace of mind—a pastime, by-the-way, which lovers are very apt to indulge themselves in every where.

If this, however, was his design, he unfortunately failed in it, since there was no conversation audible. Like Haidee, our heroine had long since discovered that the don beside her did not understand a word she said. Yet, judging from his liveliness of manner, the Prince must have learned something agreeable to his feelings; and it was clear enough that he was being instructed after a fashion quite equal if not superior to the ordinary forms of speech; for this fair lady of the bow-oar

“Had recourse to nods and signs,
And smiles and sparkles of the speaking eye,
And read (the only book she could) the lines
Of his fair face,”

which seemed to be quite enough to satisfy her fancy—and his, too, for that matter.

The hours passed scarcely less pleasantly to the rest of the party than to the Prince, although in a somewhat different manner. At least there was no lack of lively episodes, and we all found ourselves much surprised when we discovered that we were approaching the end of the fiord.

And there before us was the most famous of all the ruined hamlets of the ancient Northmen. There was the old church of Krakortok, and the broken walls of other buildings whose foundations were laid near a thousand years ago.

Leaving the artists to their chosen task, the crew to get the boat ashore, the cooks to prepare the dinner, and the lovers to their jealousies, I set out to survey the grounds.

The hill-side upon which once stood the town of Krakortok is much broken, but there are many level patches, rich with vegetation, which seem to have been once cultivated, and which even now appear like arable lands. Small streams course through them, and along their banks there is a rich display of vegetable growth. It is said that here the

old Northmen cultivated barley, and one could not view the scene without being well convinced that it were possible. Even at the present time, although the climate has grown colder steadily, so far at least as one could see, barley might grow and ripen readily. Yet the brightest day of midsummer is liable, as Mr. Anthon told me, to be followed by a severe frost, and the season is, in any case, too short for complete fruition. There is, therefore, no attempt made, even in this most mild and pleasant part of Greenland, to produce any thing more than the ordinary garden crucifera, such as radishes, pepper-grass, and lettuce; and none better have I tasted any where than those which grew in the neat little gardens of the pastor of Julianashaab, and the governor, Mr. Kursch.

Passing from the contemplation of the past agricultural richness and the present agricultural poverty of the region around Ericsfiord, I went about visiting the ruined church. It had once been inclosed by a stone fence, the outlines of which I had no difficulty in determining. Judging from the stones, this fence must have been about five feet high.

The church walls are still quite perfect to from ten to eighteen feet altitude, and even the form of the gables is yet preserved. The door-ways, three in number, are not in the least disturbed by time, the windows are mostly entire, except on the north side, and the arched window of the eastern end is still almost perfect. Beneath this window was the chancel, and the church was constructed with singular exactness as to orientation, a circumstance which could hardly have occurred by accident, since all the sacred buildings of the old Northmen in Greenland were erected with the same accuracy as to the meridian line. This they could only have done by a careful observance of the movements of the heavenly bodies, since the magnetic needle was, of course, to them unknown.

I can not claim credit for the discovery of these Norse ruins at Krakortok, since they have been heretofore visited successively by Hans Egede, Captain Graah, and Dr. Rink, but I made the first accurate survey of them, and constructed the first complete map of the neighboring region. Aided by two friendly assistants, I staked off a base line, and by a system of triangulations and levels obtained materials for a very perfect plot; besides which, I inspected the ruined buildings carefully, and measured them to the fraction of an inch.

The walls were constructed as if they were meant to last, and they indicate that the Northmen had no idea of temporary sojourn in the country, but, on the contrary, looked forward to a permanent residence for their race, the walls of the church being four and a half feet thick, those of the other build-

RUINS OF THE NORSE CHURCH AT KRAKORTOK, SOUTH GREENLAND.

ings from three to four. But in their construction no mortar had been used—nothing but blue clay, which served only to fill up the interstices, and did not hold the wall together, since it had nearly all washed out with time without impairing the solidity of the structure itself, except on the south side, where the wall leans a little, and threatens ultimately to fall.

In one angle of the church-yard there had been a building that was very likely the almonry, and in another part of it was the residence of the priest or bishop; for here, and at Brattahlid and Gardar, further up the fiord, seventeen successive bishops dwelt between the twelfth and fifteenth centuries,

when the colonies became extinct. The bishop was appointed by the pope at Rome, upon the advice and recommendation of the King of Norway, and was known as the Bishop of Gardar; and this Greenland see over which he presided occupied at one time a conspicuous place in the Christian world.

Outside the church wall, and not far removed from it, there was a building evidently of much pretension. It was divided into three compartments, and was sixty-four by thirty-two feet in dimensions. There was another still further to the westward, others to the east, and one on a natural terraco above the church. Altogether the cluster of buildings comprising the church estate,

and upon which dwelt the officers who governed the country round about, and administered in this distant place the ordinances of the pope at Rome, were nine in number—a church, a tomb, an almonry, five dwellings, and a round edifice, the walls of which, like those of the church-yard, had completely fallen. The outline of the foundation was still, however, perfect. The wall had been four feet thick, and the diameter of the edifice in the clear was forty-eight feet. There had been but one door, which opened toward the church.

To call this circular building a tower, in the sense of its application to the famous round towers of Ireland, would be a great stretch of the imagination; but there is, however, a strange coincidence in the circumstance of proximity to a church; and, in fact, near all the church edifices of the old Greenland Northmen ruins of similar round structures of different dimensions are to be seen. None of them are, however, so large as that at Krakortok. Its uses are only to be guessed at. Possibly it may have been a work of military defense against the Esquimaux; perhaps it was a baptistery; there is nothing, however (except its shape), to prove that it was not a cow-house; nothing more, indeed, than there is to prove that the ancient structure at Newport, where the Northmen from Greenland are known to have resided about the year 1006, was not a mill.

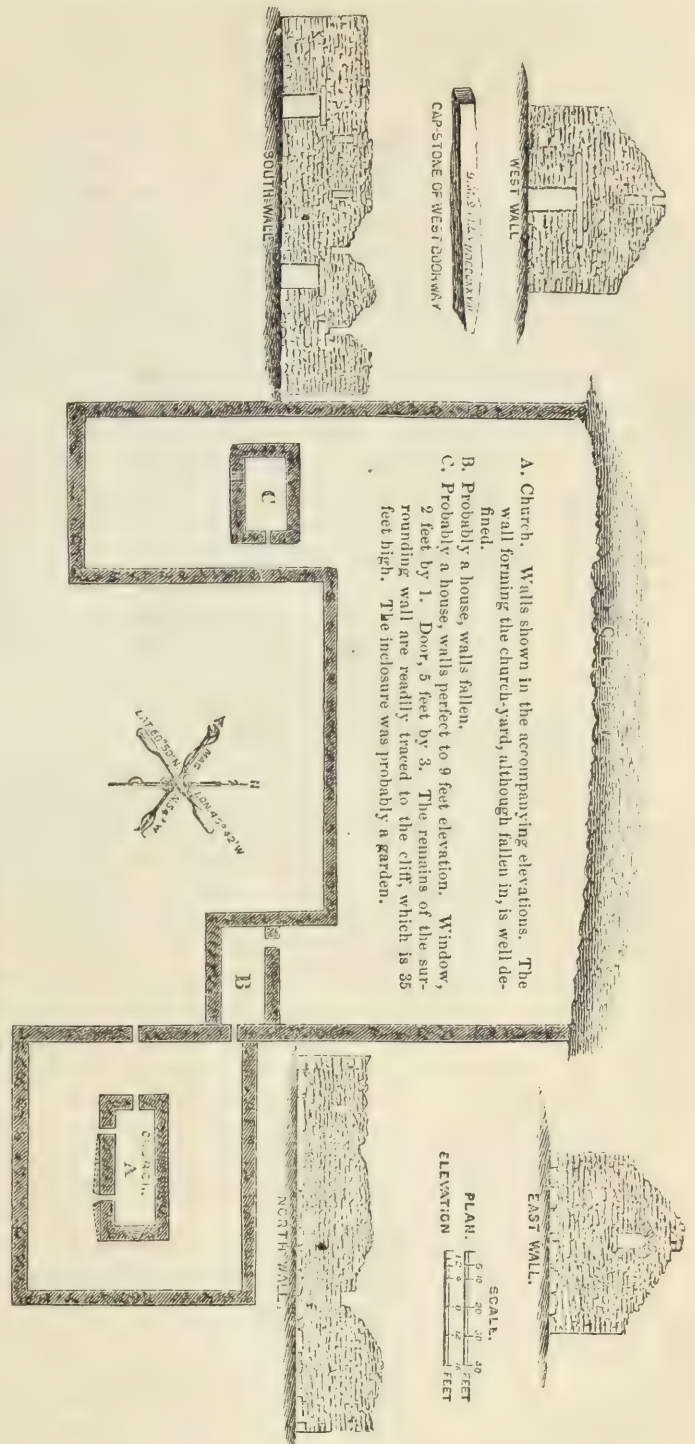

After completing our survey of Krakortok we visited other parts of the fiord. The ruins are very numerous hereabout, but the walls are all quite leveled with the ground, except those of the church above described, and the bishop's residence; and the places where they stood are often hardly recognizable, on account of the willow, birch, and juniper bushes which have overgrown the fallen stones.

What a wonderful change! I could but feel sad at the contemplation of this wreck of humanity. Here adventurous Icelanders, Norwegians whom tyranny had driven, like the Pilgrim fathers, from their native land, Jormsburg vikings, weary with their marauding expeditions, Danes, surfeited with their conquests in Britain, Ireland, France, and Italy, had come, tired of war and bloodshed,

to find a peaceful resting-place. Here they built comfortable dwellings, and churches wherein they might worship God according to their conscience; here they had reared herds of cattle and flocks of sheep upon pastures of limitless extent. And now where are they? Those famous lines of Byron, in the "Siege of Corinth," came forcibly to my mind:

"Out upon time! it will leave no more
Of the things to come than the things before.
Out upon time! who forever will leave
But enough of the past for the future to grieve
O'er that which hath been, and o'er that which
must be:
What we have seen our sons shall see—
Remnants of things that have passed away,
Fragments of stone reared by creatures of clay."

GROUND-PLAN AND ELEVATION OF NORSE RUINS AT KRAKORTOK, SOUTH GREENLAND.

A single inscription on a tombstone, carved in Runic characters upon a granite slab, is the only record yet found upon the spot:

"VIGDIS, DAUGHTER OF M—, RESTS HERE. MAY
GOD REJOICE HER SOUL!"

And may God rejoice the souls of all those worthies of the olden time!

Exactly when the destruction of this people took place we are left in doubt. The bishop's see was practically abandoned in 1409, but long before this the people were reduced to desperate straits, owing to many causes, chief among which were the withdrawal of trade in consequence of European wars, the visits of piratical expeditions, the black death, which swept thence from Europe, the gradually increasing severity of the climate, and, last of all, the hostility of the newly arrived Esquimaux.

These savages appear to have been at that period a warlike race, although at the present time generally peaceful enough. In the year 1349 they completely overran and destroyed the West Bygd, which was all that part of Greenland lying north of Ericsfiord. Encouraged by their success in that quarter, they attacked the East Bygd soon afterward. The churches were one by one pillaged; the Northmen, overpowered by superior numbers, were massacred, and the monasteries of St. Olaf, St. Michael, and St. Thomas were leveled with the earth; and the destroying hand of time, completing what the barbarous red-skins had begun, has left no trace or record even of the sites whereon they stood. The Iceland sagas tell us only that the latter was close beside a boiling spring, from which hot water, carried in pipes through the house, gave it a pleasant and uniform warmth throughout the year.

A peculiar interest attaches to Krakortok from the circumstance that here the Northmen made their last stand against their savage foes, and, under the leadership of a man named Ungitok, for several years they made an obstinate though unsuccessful resistance. Stratagem in the end accomplished what persistent fighting had failed to do before; and the device to which the savages resorted was not unworthy to rank with the famous wooden horse of Troy. A fleet of boats, filled with armed men and firmly lashed together, were covered with white skins to resemble an iceberg, and drifted with the current down upon the doomed Christians. The town was fired, and those who did not perish in the flames met their death upon the spears of their assailants. Ungitok alone escaped with his young son, but, being pursued to the mountains, they both perished in the end, the last man of his race falling by the hand of the chief of the new people who had come to possess the lands of the old.

Our day at Krakortok proved in every sense a most enjoyable one, and full of profitable

discovery. Our dinner was spread under the ample shelter of a tent, which screened us from the rays of the sun, and formed a not bad substitute for the protecting trees under which one picnics in other lands. There seemed to be but one drawback to our complete enjoyment, and that was the heat, with its attendant consequences. At noon the thermometer indicated 72° in the shade, and this high temperature started enormous quantities of small flies and mosquitoes, from which pestiferous insects we thought we had surely escaped when we came to Greenland. But no; this happiness was not to be ours. They attacked us in perfect clouds during the afternoon, and before we had quite completed our survey most of the party had betaken themselves to the oomiak, and hauled out into the middle of the fiord to escape their assaults. Not, however, until much sport and merriment had been made in sundry ways, not a little of which was at the expense of the unlucky Marcus, who, early in the day, had conceived the idea that our Prince was making mischief with his matrimonial prospects; for not only was Marcus dead in love with the fair Concordia, but, as rumor had it, he was positively betrothed to her, and was to be married in a fortnight.

In grateful appreciation, no doubt, of the Prince's attentions to her at the oar, the lively damsel of the seal-skin pantaloons wove wreaths of wild flowers for his hat, sang for him in irreproachable Esquimaux, and performed other coquettish acts of that kind with which recognized lovers are not unfrequently, I believe, tantalized in other places than Greenland—a woman's rightful privilege the world over.

Marcus, naturally enough, was not at his ease. Who would have been under like circumstances? He had too much Danish blood in his veins to allow the Esquimaux mask of indifference to fit his face well, so he could not show himself at ease when he was not. Whether the Prince discovered the disturbed state of his feelings is not certain, but it is certain that he did not treat the matter with much attention, for he never allowed Marcus to approach the object of his affections, except once, and then Marcus was overheard to reproach her with flirting with the American. "Look at him," exclaimed the anxious and unhappy lover—"look at him, with his pockets full of beads and jewelry! Look at him, with his popgun of a rifle! Do you imagine he could shoot a seal with it? No, never! And, if he did, could he get it home? No! Can he go in the fleet kayak? Can he climb the cliffs of the kittiwake, or gather the eggs of the lumme? Can he dart the spear at the eiderduck? Can he scale the mountain-side in pursuit of the reindeer? Look at his pale face, and answer me!" By which time fair-

ly boiling over with rage and vexation as he thus recited the Prince's negative qualities, he exclaimed, with great energy, "No! He can do none of these things." Then he contemptuously expressed his private opinion that the Prince was "good for nothing." After which he straightened himself to his greatest height, and exclaimed, with much complacency, "Look at me!"

"I don't want to," spoke the girl, with much spirit; "I won't!" which terminated the colloquy; for the Prince himself coming up at that moment, and addressing himself to the indignant lover, desired to know of him if his mother was intimately acquainted with his whereabouts. Without, however, wasting much time for an answer, the Prince called for the music (the boy who steered our oomiak had brought up a cracked fiddle), and then seizing Concordia by the waist, he whirled with her through the old Norsemen's grave-yard in a fantastic waltz, that must have made the very dry bones of antiquity fairly rattle again. Could the old priests of Krakortok, with the bishops at their head, have arisen then and there, they would doubtless have anathematized the whole party on the spot, for others were not slow to follow this lively example of the Prince and Concordia; and the dance over the defunct Northmen did not terminate until the party had gone through with several hornpipes and Greenland reels, of a kind, I dare say, never heard or dreamed of by Terpsichore, during all of which time Marcus was solemnly leaning against the old church wall, looking on in a very defiant manner, especially when the Prince and Concordia came near him, at which time he was always observed to have his fists thrust far down in his pockets, as if that were the only safe place for them.

Whatever may have been Marcus's recollections of the day, certainly all the rest of us had a thoroughly good time of it. The

A DISCONSOLATE LOVER.

day, however, lost something of its romantic character when the shades of evening began to trail over us, and the sun going down behind the distant glacier-covered mountains, left the chilliness of evening to succeed the warmth of noon, as fatigue succeeded to the freshness of the morning. When, therefore, we had completed our survey of Krakortok, we were a much more orderly party than we had been previously; and when once more afloat in our oomiak, we went about from place to place in the fiord, visiting other ruins with a solemnity more befitting explorers. The jealous Marcus had now less cause of complaint against the Prince; yet he never recovered his liveliness of disposition. He paddled along beside the oomiak (at his post of duty), looking neither to the right nor to the left, saying never a word, but evidently thinking very hard. When we had at length reached Julianashaab, and had thanked the good pastor, to whom we were so much indebted, and had bade good-night to our faithful oarswomen, I took the disconsolate lover to one side to soothe him.

"Are you not," said I, "son of the headman of Bungitak?"

"Ab," said Marcus, nodding his head; and

THE COLONY OF JULIANASHAAB, SOUTH GREENLAND.

I thought a gleam of satisfaction overspread his features at being reminded of his distinguished parentage.

"And Concordia is very pretty?" I continued.

"Ab," said Marcus, with a sigh.

"Do you know what pretty girls do in my country?" I inquired.

"Na-mick," he answered, with an appearance of curiosity.

"When the pretty girl has the chance, she always marries the son of the head-man."

And the countenance of Marcus glowed with joy, and he went his way with a smile, which clearly said that if it was not much to be Marcus, it was well to be the son of the head-man of Bungitak.

The day following our return being Sunday, we had an opportunity to see the modern, as we had before seen the ancient, Christian church of Ericsfiord.

Julianashaab is not at any time a particularly lively place; but there is sufficient activity during six days of the week to make the silence of the seventh very marked. Solemnly silent it seemed as I landed on the beach and made my way beside the little stream which flows through the town from a beautiful lake toward the temple dedicated to God among the majestic hills. The people, savage and civilized alike, had rested from their labors—the fishermen from their nets and lines, the hunters from their roaming in the valleys; the stroke of the

cooper's hammer and the ring of the blacksmith's anvil were no longer heard. Even the voices of the inhabitants were hushed, as if awed by the presence of that divinely ordained day which we are commanded to remember every where and keep holy. The day was delightfully calm; the sun gave a pleasant autumnal warmth to the atmosphere, and altogether it was one of those peaceful Sunday mornings which one enjoys so much at home in the country.

As I approached the church the only sounds that I heard were those made by the tumbling brook, until I came very near, when sweet music from an organ rose above the voice of the glad stream. It was a most agreeable surprise, as I had not expected to find in Greenland any such artificial means of inspiring religious feeling.

When I had reached the church and looked about me I discovered, as happens not unfrequently elsewhere, that most of the congregation were women. The organ, which was of the quaint device of the last century, was played by a native with reasonable skill, and the catechist led the singing, in which the entire congregation joined, with a good, strong voice.

I have never seen a congregation pay closer attention to the pastor than these rude people paid to Mr. Anthon. They seemed eager for instruction, and drank in his every word, when he came to preach the sermon, with the greatest avidity. The sermon was well adapted to the needs of a people exposed to the dangers of the sea, as they are continually. The hymns were aptly chosen, and as an illustration of the language in which they, as well as the sermon, were delivered, I will quote the first stanza of one of them, which, no doubt, my fair readers will find no difficulty in singing for themselves. Thus it runs:

*Aut nellekangitsuk
Pirsaunekangarpuk
Kuttingub attausingut
Innuil nunametut
Annau-sinna kullugit
Kingsarsair karnanit.*

Which, being literally translated, line by line, means,

That blood, that inestimable,
Hath a very great power.
A single drop,
The men that are on earth,
That it hath power to redeem them
From the cruel hater's jaws.

Another, which was an exhortation to all men to come to Jesus, began thus:

*Krikicktorsimarsuk
Jesuse innulerkipuk.*

The services ended, I went with Mr. Anthon to the parsonage, and passed the greater part of the day with his agreeable family.

It is pleasant to contemplate the change

which has come over the Esquimaux of Greenland since the Christian missionaries first came among them. At the time when they overcame the Northmen, and occupied the country which a hardy Christian people had for a long while possessed in peace, they led a purely nomadic life, and dressed solely in the skins of wild beasts. Now they live in permanent communities, and have adopted the habits and, in some measure, the costume of civilized men. Unlike many savage peoples, the introduction of the forms of civilization among them has not been attended with the usual corresponding mischief—a circumstance due, in a great measure, if not wholly, to the paternal care of the Danish government, which, beginning with the first missionary, Hans Egede, in 1721, has been continued with much skill by his successors, and by none more conspicuously than Dr. Henry Rink, who has passed a considerable portion of his time in Greenland, and was, until lately, royal inspector for the southern districts.

The principal feature of Dr. Rink's administration is the parliament of natives, and in the establishment of this arrangement its author has earned as much credit for skilled benevolence as he had before acquired for scientific exploration.

The idea of an Esquimaux parliament struck me as something ludicrous when I first heard of it, but upon gaining an intimate acquaintance with its workings, I changed my mind, and became convinced that other parliaments might imitate them with advantage.

Each little town or hunting station of the district is at liberty to send up a representative to a seat in the parliament at Julianashaab, the number of representatives being twelve. The most important towns, besides the capital, are Nenortalik, Fredericksdal, Lichtenau, Igalliko, and Kraksiment.

The parliament was in session during our stay, and I visited it as a privileged guest; for, be it known, the Julianashaab parliament sits with closed doors. The parliament-house is not an imposing edifice. I should say its dimensions are about sixteen by twenty feet. It is one story high, is built of rough pine boards, lined on the inside and painted blue, and on the outside is plastered over with pitch. It has no lobby for the accommodation of people who come to the capital with axes for the public grindstone, and no committee-rooms for the better confusion of the public business.

In the middle of the one room, or hall, stood a plain pine table, with a plain bench on either side of it, and on each bench sat six parliamentarians, dressed in seal-skin pantaloons and boots, and Guernsey frocks, across which there was a very large display of suspenders. Each parliamentarian head was covered with a cap composed of the

A GREENLAND PARLIAMENT.

brightest kind of scarlet cloth, ornamented with a broad gilt band. The royal emblems were embroidered in front, and above these there was a golden bear, with a crown on his head, standing uncomfortably on his hind-legs, to typify Greenland. There was a thirteenth cap at the head of the table, and this was worn by Mr. Anthon, pastor of Julianashaab, and president of the Julianashaab parliament *ex officio*.

The aggregate amount of dignity possessed by this parliament was something wonderful to see. To be sure, the parliamentarians were somewhat impregnated with a fishy aroma, indicative of their nationality and calling; but neither the fishy aroma nor the dignity appeared to interfere with the transaction of business; on the contrary, they seemed to be working away like beavers; and, indeed, they disposed of the matters brought before them with such an amazing degree of promptness that I fell to wondering whether dignity would not be a good thing to introduce into parliaments, congresses, assemblies, and such like things generally.

The first business was in form of a petition for relief. The petitioner stood there in person, looking the very picture of forlorn destitution. He stated that he had lost his canoe (kayak), and he produced evidence enough to show, without any swearing, false or otherwise, that it had been crushed and lost in the ice. The man, who had hardly clothes on his back to cover his nakedness, showed further that he had a wife and family who had no friends to assist them, and were entirely dependent upon himself for support. I thought it a doubtful support at best, and so appeared to think the parliament, for they voted an order for a certain daily allowance. The next case was of a young hunter, whose kayak had been crushed by the ice, and who had not the means to build a new one. They voted

him a loan. A third case was an old man, who received one dollar to buy a spear with; another was partly a loan and partly a gift to a man who had a family of girls, and required materials for an oomiak. Still another made application for and received assistance to bury a dead husband.

Our short stay at Julianashaab and vicinity was altogether most agreeable. At length,

however, we were prepared for departure, but the only pilot of the place was that day occupied with bringing in the Danish ship, the arrival of which has left a strong impression on my mind, since it made the isolation of the Danes who dwell there so apparent.

When the announcement was made that the ship was in the offing, the excitement was at first intense; and the hours of the day, while the ship was coming up the fiord with baffling winds, were anxious ones.

The vessel proved to be the *Tjalfe*, one of the best of the Company's vessels—a brig of three hundred tons, and taut and tidy as a man-of-war. I had a visit from the master in the morning, and was rejoiced to find in him an old friend, to whom, in 1855, when I had escaped with Dr. Kane from the abandoned brig *Advance*, I was indebted for many serviceable attentions—Captain Amondson, one of the most tried and trusty servants of the Royal Company.

Upon going ashore in the morning with Captain Amondson, I was pleased to learn that all the letters brought good news. We found every body in a perfect wilderness of papers, books, packages, and boxes containing every conceivable thing that thoughtful friends would think of sending to cheer and gladden lives that must be at times overwhelmed with loneliness. It was very touching to see these evidences of remembrance scattered about, and very gratifying to be partakers of the general joy. Photographs there were by the dozen; one of a little stranger that had come into the world within the twelvemonth, and sent his compliments and his picture; another of a newly married couple, who looked peculiarly happy for people who had been married nearly six months, and sent their picture in proof of it; another was from an aged mother; another from a brother who had gone into the army; another from a boy at school.

I went from house to house, and every where it was the same. Happiness was universal; and it really seemed as if solitude might be "sweet society," if retirement brought such occasional bliss; only the retirement of a year for the sake of the emotion is a little too much for ordinary mortals.

As for the people in general, they were delighted beyond expression. Nothing but the pressure of actual starvation could possibly have induced any hunter to go out at such a time. Shouting and singing were the order of the day. The little harbor was alive with their cunning little craft, shooting hither and thither; the boatmen indulging themselves in the most ludicrous sport and gesture, by way of exhibiting their satisfaction, not only at the arrival of the Danish ship, but that two vessels were in the harbor at one time—a sight which they had never seen before. Then, to cap the climax, when evening came they must have a dance. Every body was invited, and, of course, none of the sailors of the two ships made any objection to a frolic of that nature. They did not share the people's delight in the least; they would be glad enough, on the other hand, to be any where else almost; but a dance! what sailor could resist that? And as for our officers and passengers, all were alike ready for a little fun to break the monotony of life, either as actors or spectators, and willing to take a hand in any thing that might be turning up.

I asked the governor if there was nothing to be feared from letting two ships' companies loose among the peaceful villagers when there were no police to take rude fellows into custody. "Oh no," he answered; "not in the least; let them come. If the men are rude, the women will take care of themselves, I promise you; and if not, they have big brothers plenty. Have no fear; there are no more modest women in the world than ours, and sailors are naturally quick to detect honesty, and, when found, to respect it."

So a dance was arranged for—or a "ball," as our people facetiously called it. The carpenter-shop was secured for the occasion, and a neighboring shed for the supper-room, and the preparations went on all the afternoon. The orchestra of Julianashaab, consisting of a dilapidated keg with heads of tanned seal hide, and the cracked fiddle already mentioned, was secured, and all was ready by eight o'clock, when I went down to see the opening.

The decorations of the ball-room in the way of flags and Danish and American bunting generally were astonishing to the natives. Candles were stuck around the room in reckless profusion. Maria (our stroke-oar of a previous occasion) had about a bushel of coffee, which she was roasting and boiling in the shed. The whole village was in com-

motion. Women in red boots, women in white boots, women in green and yellow boots, were hurrying to the ball-room from every quarter. They had all turned out in their very best, and some of the toilets were, to say the least, "stunning." Boots, beads, pantaloons, and ribbons were all of the gayest and the finest. The maidens and matrons of Julianashaab sustained the credit of their sex. And they showed, too, that they were conscious of appearing to better advantage than usual, for they looked about with less timidity than on ordinary occasions, as if to say, "Look at me *now*, and see what I *can* do when a great occasion makes it worth my while!" Several of them were pretty and quite stylish, and certainly this is saying much, for their peculiar style of costume is rather trying to the ordinary female figure. As for dancing, no costume could possibly be more suitable, and when on the floor its advantages were quite apparent, for I have rarely seen dancers that were more light and graceful in their movements. I would not, however, be understood to recommend the dress, even in the present dearth of new cuts from Paris, for general adoption outside of Greenland.

The confidence with which the ladies approached the ball-room seemed to forsake them when they got inside, and there awaited the men; for the moment they had passed the door they darted to the remotest corner, where they all huddled together as close as they could pack themselves, like a flock of frightened sheep run one by one into a pen. The men did not keep them long in this state of timid embarrassment; but they seemed, however, to be in no very particular hurry, sauntering along quite leisurely, with their hands in their pockets, and short clay pipes in their mouths. Most of them were capless, and none of them seemed to have thought of "dressing" for the occasion, except the parliamentarians, who, out of respect for their own dignity, as I suppose, wore the official scarlet on their heads—royal emblems, gold-lace, and all—a top-covering which, taken into account with their Guernsey frocks, broad suspenders, and seal-skin pantaloons coming up under the armpits, made a style of official get-up not, I fancy, to be seen in any other country. Yet the Lord Chancellor wears his frizzled wig, and why not they their scarlet caps?

The sailors came ashore from the two ships, jabbering away at one another quite frantically in Danish and English, and the officers and passengers came likewise, to take a hand in the entertainment.

But where was Concordia the while? and where was the Prince? for they were to open the ball. The question was asked repeatedly, and as often remained unanswered. Whispers began to pass around the room. Had there been an elopement? Marcus was there,

CONCORDIA DRESSED FOR THE BALL.

trying hard to look unconcerned by smoking a short clay pipe, and keeping his fists in their usual place of safety. Every body seemed to look to him for explanation.

At length the mystery was cleared up, and very suddenly, for the Prince came bounding into the room, holding Concordia by the hand. The arrival created a great sensation. Concordia was literally dazzling. The Prince had clearly been assisting at her toilet. She was covered with beads and jewelry. A magnificent plaid shawl, which the Prince had been sporting through the voyage, and which had two days before suddenly disappeared, now re-appeared in the shape of a jaunty jacket, trimmed with eider-down, on

Concordia's graceful shoulders. And what shining pantaloons of the softest silver seal-skin! what spotless snow-white boots inclosed her dainty little feet! But the Prince! Oh, what a stunning get-up, to be sure! Sea-boots, matching Concordia's for length, if not in purity of color; a bright scarf across his shoulders and around his waist; a Scotch cap with a dissipated feather in it. What a picture for a ball-room! No wonder that Marcus grew several shades lighter in color; no wonder that his pipe fell from his mouth, and broke in pieces on the floor; no wonder that he stole out of the room, as if the place were too hot for him, and was seen no more in the ball-room that night!

"*Strike up!*" shouted the Prince, bringing down a sea-boot on the floor. "Rat-tat-a-tat" went the keg, "cr-r-r-p, cr-r-r-p, cr-r-r-p" went the cracked fiddle, and then both went in to do their best and win; but the keg having got the lead, kept it, and the cracked fiddle was nowhere. When both had got well warmed up in the

race, the Prince brought down his sea-boot again, making the old carpenter-shop fairly quake and tremble; then, with a shout which was probably taken for an American war-whoop, he seized Concordia by the waist; others followed this agreeable example with their chosen partners, and never did "Pop goes the weasel" do duty before to such a whirl as followed.

The ball was opened. The Prince and Concordia had gracefully done their duty, and satisfied the public expectation. They had given countenance to the revelry, and the revelry went on. To say that it never stopped would be to exaggerate; but to say that it never would have stopped had there

been something of what Dick Swiveller called "the rosy," might possibly be to keep the truth within proper bounds. The revelers certainly made "a night of it," if a night ever was made in a Greenland summer. As it was, the coffee had all given out, a whole box of tobacco had disappeared, the keg had resolved itself into its original staves, and the cracked fiddle had but one string left, and that had been twice tied, when the ladies, with their beautiful boots all knocked out of shape, began to drag their weary bodies off to their huts, and the sailors, with their coats on their arms, hailed for boats.

Meanwhile much consternation had been produced by a report which was set in circulation that a parliamentarian had danced himself away all but his cap, and a girl had in like manner disappeared all but a ribbon. The consternation was allayed, however, when it was discovered that the two had stolen away together, and were getting married at the parson's. Marcus never showed himself in public after his discomfiture. But

I saw him crouching in the shadow of a rock where he could look through the door and catch an occasional glimpse of his lady-love as she swung round in the Prince's arms. He beckoned me to him, and whispered in my ear, pointing to the festive room from which the bright light was streaming out into the night: "He no good. Me" (pointing to his breast) "son of head-man of Bungitak." Then he smiled placidly, and drew himself deep within the shadow of the rock, and I went my way on board.

As this was to be my last visit ashore, I had bidden my friends good-by, after exchanging some little souvenirs with them. Early in the morning the anchor was tripped, and we were away. The little town in the wilderness was at our backs, and we were once more threading the winding fiord, among the islands and icebergs, rejoicing at having seen a spot of earth so full of romantic associations; had beheld its ruins,

"Trode upon them, and had set
Our foot upon a rev'rend history."

THE AMERICAN BARON.

BY THE AUTHOR OF "THE DODGE CLUB," "THE CRYPTOGRAM," ETC.

"'WORSE AND WORSE,' SAID TOZER."

CHAPTER XXXVII.

MINNIE'S LAST LIFE-PRESERVER.

WHEN Tozer started after Dacres he led Minnie by the hand for only a little distance. On reaching the acclivity he seized her in his arms, thus imitating Dacres's example, and rushed up, reaching the top before the other. Then he plunged into

the woods, and soon became separated from his companion.

Once in the woods, he went along quite leisurely, carrying Minnie without any difficulty, and occasionally addressing to her a soothing remark, assuring her that she was safe. Minnie, however, made no remark of any kind, good or bad, but remained quite silent, occupied with her own thoughts. At length Tozer stopped and put her down. It was a place upon the edge of a cliff on the shore of the lake, and as much as a mile from the house. The cliff was almost fifty feet high, and was perpendicular. All around was the thick forest; and it was unlikely that such a place could be discovered.

"Here," said he; "we've got to stop here, and it's about the right place. We couldn't get any where nigh to the soldiers without the brigands seeing us; so we'll wait here till the fight's over, and the brigands all chased off."

"The soldiers! what soldiers?" asked Minnie.

"Why, they're having a fight over there—the soldiers are attacking the brigands."

"Well, I didn't know. Nobody told me. And did you come with the soldiers?"

"Well, not exactly. I came with the priest and the young lady."

"But you were not at the house?"

"No. They wouldn't take me all the way. The priest said I couldn't be disguised—but I don't see why not—so he left me in the woods till he came back; and then the sol-

"HE GAVE A LOUD CRY OF JOY, AND THEN SPRANG UP THE BANK."—[SEE PAGE 83.]

diers came, and we crept on till we came nigh the lake. Well, then I stole away; and when they made an attack the brigands all ran there to fight, and I watched till I saw the coast clear, and so I came, and here we are."

Minnie now was quite silent and preoccupied, and occasionally she glanced sadly at Tozer with her large, pathetic, child-like eyes. It was a very piteous look, full of the most tender entreaty. Tozer occasionally glanced at her, and then, like her, he sat silent, involved in his own thoughts.

"And so," said Minnie at last, "you're not the priest himself?"

"The priest?"

"Yes."

"Well, no; I don't call myself a priest. I'm a minister of the Gospel."

"Well, you're not a *real* priest, then."

"All men of my calling are real priests—yes, priests and kings. I yield to no man in the estimate which I set upon my high and holy calling."

"Oh, but I mean a Roman Catholic priest," said Minnie.

"A Roman Catholic priest! Me! Why, what a question! Me! a Roman Catholic! Why, in our parts folks call me the Protestant Champion."

"Oh, and so you're only a Protestant, after all," said Minnie, in a disappointed tone.

"Only a Protestant!" repeated Tozer, severely—"only a Protestant! Why, ain't you one yourself?"

"Oh yes; but I hoped you were the other priest, you know. I did so want to have a Roman Catholic priest this time."

Tozer was silent. It struck him that this young lady was in danger. Her wish for a Roman Catholic priest boded no good. She had just come from Rome. No doubt she had been tampered with. Some Jesuits had caught her, and had tried to proselytize her. His soul swelled with

indignation at the thought.

"Oh dear!" said Minnie again.

"What's the matter?" asked Tozer, in a sympathizing voice.

"I'm so sorry."

"What for?"

"Why, that you saved my life, you know."

"Sorry?—sorry?—that I saved your life?" repeated Tozer, in amazement.

"Oh, well, you know, I did so want to be saved by a Roman Catholic priest, you know."

"To be saved by a Roman Catholic priest!" repeated Tozer, pondering these words in his mind as he slowly pronounced them. He could make nothing of them at first, but finally concluded that they concealed some half-suggested tendency to Rome. "I don't like this; I don't like this," he said, solemnly.

"What don't you like?"

"It's dangerous. It looks bad," said Tozer, with increased solemnity.

"What's dangerous? You look so solemn that you really make me feel quite nervous. What's dangerous?"

"AND AS THEY STOOD THE CLERGYMEN SLOWLY CAME OUT OF THE HOUSE."—[SEE PAGE 86.]

"Why, your words. I see in you, I think, a kind of leaning toward Rome."

"It isn't Rome," said Minnie. "I don't lean to Rome. I only lean a little toward a Roman Catholic priest."

"Worse and worse," said Tozer. "Dear! dear! dear! Worse and worse. This beats all. Young woman, beware! But perhaps I don't understand you. You surely don't mean that your affections are engaged to any Roman Catholic priest. You can't mean that. Why, they can't marry."

"But that's just what I like them so for," said Minnie. "I like people that don't marry; I hate people that want to marry."

"Now as to Rome," resumed Tozer: "have you ever given a careful study to the Apoca-

lypse—not a hasty reading, as people generally do, but a serious, earnest, and careful examination?"

"I'm sure I haven't any idea what in the world you're talking about," said Minnie. "I wish you wouldn't talk so. I don't understand one single word of what you say."

Tozer started and stared at this. It was a depth of ignorance that transcended that of the other young lady with whom he had conversed. But he attributed it all to "Roman" influences. They dreaded the Apocalypse, and had not allowed either of these young ladies to become acquainted with its tremendous pages. Moreover, there was something else. There was a certain light and trifling tone which she used in referring

to these things, and it pained him. He sat involved in a long and very serious consideration of her case, and once or twice looked at her with so very peculiar an expression that Minnie began to feel very uneasy indeed.

Tozer at length cleared his throat, and fixed upon Minnie a very affectionate and tender look.

"My dear young friend," said he, "have you ever reflected upon the way you are living?"

At this Minnie gave him a frightened little look, and her head fell.

"You are young now, but you can't be young always; youth and beauty and loveliness all are yours; but they can't last; and now is the time for you to make your choice—now in life's gay morn. It ain't easy when you get old. Remember that, my dear. Make your choice now—now."

"Oh dear!" said Minnie; "I knew it. But I can't—and I don't want to—and I think it's *very* unkind in you. I don't want to make *any* choice—I don't want any of you. It's so horrid!"

This was a dreadful shock to Tozer; but he could not turn aside from this beautiful yet erring creature.

"Oh, I entreat you—I implore you, my dear, dear—"

"I do *wish* you wouldn't talk to me that way, and call me your *dear*. I don't like it; no, not even if you *did* save my life, though really I didn't know there was any danger. But I'm not *your* dear."

And Minnie tossed her head with a little air of determination, as though she had quite made up her mind on that point.

"Oh, well now, really now," said Tozer, "it was only a natural expression. I *do* take a deep interest in you, my—that is—miss; I feel a sincere regard and affection and—"

"But it's no use," said Minnie; "you really *can't*, you know; and so, why, you *mustn't*, you know."

Tozer did not clearly understand this; so, after a brief pause, he resumed:

"But what I was saying is of far more importance. I referred to your life. Now you're not happy as you are."

"Oh yes, but I am," said Minnie, briskly.

Tozer sighed.

"I'm *very* happy," continued Minnie; "very, very happy—that is, when I'm with dear, darling Kitty, and dear, dear Ethel, and my darling old Dowdy, and dear, kind papa."

Tozer sighed again.

"You can't be *truly* happy thus," he said, mournfully; "you may think you are, but you *ain't*. My heart fairly yearns over you when I see you, so young, so lovely, and so innocent; and I know you can't be happy as you are; you must live otherwise; and oh! I pray you, I entreat you, to set your affections elsewhere."

"Well, then, I think it's very, very horrid in you to press me so," said Minnie, with something actually like asperity in her tone; "but it's *quite* impossible."

"But, oh, why?"

"Why, because I don't want to have things any different. But if I have to be worried and teased so, and if people insist on it so, why, there's only one that I'll *ever* consent to."

"And what is that?" asked Tozer, looking at her with the most affectionate solicitude.

"Why, it's—it's—" Minnie paused, and looked a little confused.

"It's what?" asked Tozer, with still deeper and more anxious interest.

"Why, it's—it's—Rufus K. Gunn."

"THE DISCOVERY OF A BODY ON THE SHORE OF THE LAKE."

CHAPTER XXXVIII.

THE IMPATIENT BARON.

THE brigands had resisted stubbornly, but finally found themselves without a leader. Girasole had disappeared, and as his voice no longer directed their movements, they began to fall into confusion. The attacking party, on the other hand, was well led, and made a steady advance, driving the enemy before them. At length the brigands lost heart, and took to flight. With a wild cheer the assailants followed in pursuit. But the fugitives took to the forest, and were soon beyond the reach of their pursuers in its familiar intricacies, and the victors were summoned back by the sound of the trumpet.

It was now daylight, and as the conquer-

ing party emerged from the forest they showed the uniform of the Papal Zouaves; while their leader, who had shown himself so skillful in forest warfare, proved to be no less a personage than our friend the Baron. Led by him, the party advanced to the old stone house; and here, drawing up his men in front, their leader rushed in, and searched every room. To his amazement, he found the house deserted, its only inmate being that dead brigand whom Girasole had mistaken for Hawbury. This discovery filled the Baron with consternation. He had expected to find the prisoners here, and his dismay and grief were excessive. At first he could not believe in his ill luck; but another search convinced him of it, and reduced him to a state of perfect bewilderment.

But he was not one who could long remain inactive. Feeling confident that the brigands were scattered every where in headlong flight, he sent his men out in different directions into the woods and along the shore to see if they could find any traces of the lost ones. He himself remained near the house, so as to direct the search most efficiently. After about an hour they came back, one by one, without being able to find many traces. One had found an empty coffin in a grave, another a woman's hood, a third had found a scarf. All of these had endeavored to follow up these traces, but without result. Finally a man approached who announced the discovery of a body on the shore of the lake. After him came a party who was carrying the corpse for the inspection of their captain.

The Baron went to look at it. The body showed a great gap in the skull. On questioning the men he learned that they had found it on the shore, at the bottom of a steep rock, about half-way between the house and the place where they had first emerged from the woods. His head was lying pressed against a sharp rock in such a way that it was evident that he had fallen over the cliff, and had been instantly killed. The Baron looked at the face, and recognized the features of Girasole. He ordered it to be taken away and laid in the empty grave for future burial.

The Baron now became impatient. This was not what he had bargained for at all. At length he thought that they might have fled, and might now be concealed in the woods around; and together with this thought there came to his mind an idea of an effective way to reach them. The trumpeter could send forth a blast which could be heard far and wide. But what might, could, would, or should the trumpeter sound forth which should give to the concealed listeners a certainty that the summons came from friends, and not from foes? This the Baron puzzled over for some time. At length he solved this problem also, and triumphantly.

There was one strain which the trumpeter might sound that could not be mistaken. It would at once convey to the concealed hearers all the truth, and gently woo them home. It would be at once a note of victory, a song of joy, a call of love, a sound of peace, and an invitation, "Wanderer, come home."

Of course there was only one tune that to the mind of the Baron was capable of doing this.

And of course that tune was "Yankee Doodle."

Did the trumpeter know it?

Of course he did.

Who does not know it?

All men know that tune. Man is born with an innate knowledge of the strain of "Yankee Doodle." No one can remember when he first learned it. The reason is because he never learned it at all. It was born in him.

So the trumpeter sounded it forth, and wild and high, and clear and far the sounds arose; and it was "Blow, bugle, blow, set the wild echoes flying; and answer, echoes, answer, Yankee Doodle dying."

And while the trumpet sounded the Baron listened and listened, and walked up and down, and fretted and fumed and chafed, and I'm afraid he swore a little too; and at last he was going to tell the trumpeter to stop his infernal noise, when, just at that moment, what should he see all of a sudden emerging from the woods but three figures!

And I'll leave you to imagine, if you can, the joy and delight which agitated the bosom of our good Baron as he recognized among these three figures the well-known face and form of his friend Hawbury. With Hawbury was a lady whom the Baron remembered having seen once in the upper hall of a certain house in Rome, on a memorable occasion, when he stood on the stairs calling *Min*. The lady was very austere then, but she was very gracious now, and very wonderfully sweet in the expression of her face. And with them was a stranger in the garb of a priest.

Now as soon as the party met the Baron, who rushed to meet them, Hawbury wrung his hand, and stared at him in unbounded astonishment.

"You!" he cried, "yourself, old boy! By Jove!"

"Yes," said the Baron. "You see, the moment we got into the bushes I kept my eye open, and got a chance to spring into the woods. There I was all right, and ran for it. I got into the road again a couple of miles back, got a horse, rode to Civita Castellana, and there I was lucky enough to find a company of Zouaves. Well, Sir, we came here flying, mind I tell you, and got hold of a chap that we made guide us to the lake. Then

we opened on them, and here we are, by thunder! But where's Min?"

"Who?" asked Hawbury.

"Min," said the Baron, in the most natural tone in the world.

"Oh! Why, isn't she here?"

"No. We've hunted every where. No one's here at all!" and the Baron went on to tell about their search and its results. Hawbury was chiefly struck by the news of Girasole.

"He must have gone mad with terror," said Hawbury, as he told the Baron about his adventure at the grave. "If that's so," he added, "I don't see how the ladies could be harmed. I dare say they've run off. Why, we started to run, and got so far off that we couldn't find our way back even after the trumpet began to sound. You must keep blowing at it, you know. Play all the national tunes you can—no end of them. They'll find their way back if you give them time."

And now they all went back to the house, and the Baron in his anxiety could not talk any more, but began his former occupation of walking up and down, and fuming and fretting and chafing, and, I'm again afraid, swearing; when all of a sudden, on the bank in front of him, on the very top, just emerging from the thick underbrush which had concealed them till that moment, to their utter amazement and indescribable delight they beheld Scone Dacres and Mrs. Willoughby. Scone Dacres appeared to Hawbury to be in a totally different frame of mind from that in which he had been when he last saw him; and what perplexed him most, yea, and absolutely confounded him, was the sight of Scone Dacres with his demon wife, whom he had been pursuing for the sake of vengeance, and whose frenzy had been so violent that he himself had been drawn with him on purpose to try and restrain him. And now what was the injured husband doing with his demon wife? Doing! why, doing the impassioned lover most vigorously; sustaining her steps most tenderly; grasping her hand; pushing aside the bushes; assisting her down the slope; overwhelming her, in short; hovering around her, apparently unconscious that there was in all the wide world any other being than Mrs. Willoughby. And as Hawbury looked upon all this his eyes dilated and his lips parted involuntarily in utter wonder; and finally, as Dacres reached the spot, the only greeting which he could give his friend was,

"By Jove!"

And now, while Mrs. Willoughby and Ethel were embracing with tears of joy, and overwhelming one another with questions, the Baron sought information from Dacres.

Dacres then informed him all about Tozer's advent and departure.

"Tozer!" cried the Baron, in intense de-

light. "Good on his darned old head! Hurrah for the parson! He shall marry us for this—he, and no other, by thunder!"

Upon which Mrs. Willoughby and Ethel exchanged glances, but said not a word. Not they.

But in about five minutes, when Mrs. Willoughby had Ethel apart a little by herself, she said,

"Oh, Ethel dear, isn't it dreadful?"

"What?" asked Ethel.

"Why, poor Minnie!"

"Poor Minnie?"

"Yes, another horrid man; and he'll be claiming her too. And, oh dear! what shall I do?"

"Why, you'll have to let her decide for herself. I think it will be—this person."

Mrs. Willoughby clasped her hands and looked up with a pretty little expression of horror.

"And do you know, dear," added Ethel, "I'm beginning to think that it wouldn't be so *very* bad. He's Lord Hawbury's friend, you know; and then he's very, very brave; and above all, think what we all owe him."

Mrs. Willoughby gave a resigned sigh.

And now the Baron was wilder with impatience than ever. He had questioned Dacres, and found that he could give him no information whatever as to Tozer's route, and consequently had no idea where to search. But he still had boundless confidence in "Yankee Doodle."

"That's the way," said Dacres: "we heard it ever so far, and it was the first thing that told us it was safe to return. We didn't dare to venture before."

Meanwhile Hawbury had got Dacres by himself, and poured a torrent of questions over him. Dacres told him in general terms how he was captured. Then he informed him how Mrs. Willoughby was put in the same room, and his discovery that it was Minnie that the Italian wanted.

"Well, do you know, old chap," continued Dacres, "I couldn't stand it; so I offered to make it all up with her."

"Oh! I see you've done that, old boy—congrat—"

"Pooh! wait a minute," said Dacres, interrupting him. "Well, you know, she wasn't my wife at all."

At this Hawbury stood utterly aghast.

"What's that?"

"She wasn't my wife at all. She looks confoundedly like what my wife was at her best, but she's another person. It's a most extraordinary likeness, and yet she isn't any relation whatever, but a great deal prettier woman. What made me so sure, you know, was the infernally odd coincidence of the name; and then I only saw her off and on, you know, and I never heard her voice. Then, you know, I was mad with jealousy; and so I made myself worse and worse, till

I was ripe for murder, arson, assassination, and all that sort of thing, you know."

To all this Hawbury listened in amazement, and could not utter a word, until at last, as Dacres paused, he said,

"By Jove!"

"Well, old man, I was the most infernal ass that ever lived. And how I must have bored you!"

"By Jove!" exclaimed Hawbury again. "But drive on, old boy."

"Well, you know, the row occurred just then, and away went the scoundrels to the fight, and in came that parson fellow, and away we went. I took Mrs. Willoughby to a safe place, where I kept her till I heard the trumpet, you know. And I've got another thing to tell you. It's deuced odd; but she knew all about me."

"The deuce she did!"

"Yes, the whole story. Lived somewhere in the county; but I don't remember the Fays. At any rate, she lived there; and do you know, old fellow, the county people used to think I beat my wife!"

"By Jove!"

"Yes; and afterward they raised a report that my cruelty had driven her mad. But I had a few friends that stood up for me, and among others these Fays, you know, had heard the truth of it, and, as it happened, Kitty—"

"Kitty?"

"Well, Mrs. Willoughby, I mean—her name's Kitty—has always known the truth about it, and when she saw me at Naples she felt interested in me."

"Oho!" and Hawbury opened his eyes.

"Well, she knew all about it; and among other things she gave me one piece of intelligence that has eased my mind."

"Ah? What's that?"

"Why, my wife is dead."

"Oh! Then there's no doubt about it?"

"Not a bit. She died eight years ago, and in an insane asylum."

"By Jove! Then she was mad all the time."

"Yes; that accounts for it, and turns all my curses into pity."

Dacres was silent now for a few moments. At length he looked at Hawbury with a very singular expression.

"Hawbury, old boy."

"Well, Sconey?"

"I think we'll keep it up."

"Who?"

"Why, Kitty and I; that is, Mrs. Willoughby and I—her name's Kitty, you know."

"Keep what up?"

"Why, the—the—the fond illusion, and all that sort of thing. You see, I've got into such an infernal habit of regarding her as my wife that I can't look on her in any other light. I claimed her, you know, and all that sort of thing, and she thought I was deliri-

ous, and felt sorry, and humored me, and gave me a very favorable answer."

"Humored you?"

"Yes; that's what she says now, you know. But I'm holding her to it, and I've every reason to believe, you know—in fact, I may as well say that it's an understood thing, you know, that she'll let it go, you know, and at some early day, you know, we'll have it all formally settled, and all that sort of thing, you know."

Hawbury wrung his friend's hand.

"See here, old boy; you see Ethel there?"

"Yes."

"Who do you think she is?"

"Who?"

"*Ethel Orne!*"

"*Ethel Orne!*" cried Dacres, as the whole truth flashed on his mind. "What a devil of a jumble every thing has been getting into! By Heaven, dear boy, I congratulate you from the bottom of my soul!"

And he wrung Hawbury's hand as though all his soul was in that grasp.

But all this could not satisfy the impatience of the Baron. This was all very well in its way, merely as an episode; but he was waiting for the chief incident of the piece, and the chief incident was delaying very unaccountably.

So he strode up and down, and he fretted and he fumed and he chafed, and the trumpet kept blowing away.

Until at last—

Just before his eyes—

Up there on the top of the bank, not far from where Dacres and Mrs. Willoughby had made their appearance, the Baron caught sight of a tall, lank, slim figure, clothed in rusty black, whose thin and leathery face, rising above a white neck-tie, peered solemnly yet interrogatively through the bushes; while just behind him the Baron caught a glimpse of the flutter of a woman's dress.

He gave a loud cry of joy, and then sprang up the bank.

* * * * *

But over that meeting I think we had better draw a veil.

CHAPTER XXXIX.

ASTONISHING WAY OF CONCLUDING AN ADVENTURE.

THE meeting between the Baron and Minnie gave a new shock to poor Mrs. Willoughby, who looked with a helpless expression, and walked away for a little distance. Dacres and Hawbury were still eagerly conversing and questioning one another about their adventures. Tozer also had descended and joined himself to the priest; and each of these groups had leisure for a prolonged conversation before they were interrupted.

At length Minnie made her appearance, and flung herself into her sister's arms; while at the same time the Baron grasped Tozer by both hands, and called out in a voice loud enough to be heard by all,

"You shall marry us, parson, and this very day, by thunder!"

These words came to Mrs. Willoughby's ears in the midst of her first joy at meeting her sister, and shocked her inexpressibly.

"What's that, Minnie darling?" she asked, anxiously—"what is it? Did you hear what that dreadful—what the—the Baron said?"

Minnie looked sweetly conscious, but said nothing.

"What *does* he mean?" asked her sister again.

"I suppose he means what he says," replied Minnie, with a timid air, stealing a shy look at the Baron.

"Oh dear!" said Mrs. Willoughby, "there's another dreadful trouble, I know. It's very, very hard—"

"Well, I'm sure," said Minnie, "I can't help it. They all do so. That clergyman came and saved me, and he wasn't a Roman Catholic clergyman at all, and he proposed—"

"Proposed!" cried Mrs. Willoughby, aghast.

"Oh yes," said Minnie, solemnly; "and I had hard work preventing him. But, really, it was *too* absurd, and I would not let him be too explicit. But I didn't hurt his feelings. Well, you know, then, all of a sudden, as we were sitting there, the bugle sounded, and we came back. Well, then, Rufus K. Gunn came, and you know how very violent he is in his way, and he said he saved my life again, and so he proposed."

"*He* proposed! Why, he had proposed before."

"Oh yes; but that was for an engagement, and this was for our marriage."

"Marriage!"

"Oh yes; and, you see, he had actually saved my life twice, and he was very urgent, and he is so awfully affectionate, and so—"

"Well, what?" cried Mrs. Willoughby, seeing Minnie hesitate.

"Why, he—"

"Well?"

"I mean, I—"

"You what? Really, Minnie dearest, you might tell me, and not keep me in such dreadful suspense."

"Why, what could I say?"

"But what *did* you say?"

"Why, I think I—said—yes," said Minnie, casting down her eyes with indescribable sweetness, shyness, meekness, and resignation.

Mrs. Willoughby actually shuddered.

"Now, Kitty," exclaimed Minnie, who at once noticed it, "you needn't be so horrid! I'm sure you can't say any thing against him

now. You needn't look so. You *always* hated him. You *never* would treat him kindly."

"But this—this marriage. It's too shocking."

"Well, he saved my life."

"And to-day! How utterly preposterous! It's shameful!"

"Well, I'm sure I can't help it."

"It's too horrid!" continued Mrs. Willoughby, in an excited tone. "It will break poor papa's heart. And it will break poor darling aunty's heart. And it will break my heart."

"Now, Kitty dearest, this is too silly in you. If it hadn't been for him I would now be married to that wretched Count, who hadn't sufficient affection for me to get me a chair to sit on, and who was very, very rude to you. You didn't care, though, whether I was married to him or not; and now, when I am saved from him, you have nothing but very unpleasant things to say about Rufus K. Gunn."

"Oh dear, what *would* I give if you were only safe home!"

"Well, I'm sure I don't see what *I* can do. People are always saving my life. And there is Captain Kirby hunting all over Italy for me. And I *know* I will be saved by somebody if—if—I—I—if—I—if—you know—that is—I'm sure—"

"Nonsense!" said Mrs. Willoughby, as Minnie broke down in confusion. "It is *too* absurd. I won't talk about it. You are a silly child. Oh, how I *do* wish you were home!"

At this juncture the conversation was interrupted by the Baron.

"It is not my fashion, ma'am," said he, gravely, "to remind another of any obligations under which he may be to me; but my claims on Minnie have been so opposed by you and the rest of her friends that I have to ask you to think of them. Your father knows what my first claims are. You yourself, ma'am, know perfectly well what the last claims are which I have won to-day."

The Baron spoke calmly, firmly, and with dignity. Mrs. Willoughby answered not a word.

"If you think on your position last night, and Minnie's, ma'am," resumed the Baron, "you'll acknowledge, I expect, that it was pretty hard lines. What would you have given a few hours ago for a sight of my uniform in that old house yonder? If I had come then to save Minnie from the clutches of that Italian, wouldn't you have given her to me with all your heart, and your prayers too? You would, by thunder! Think, ma'am, on your sufferings last night, and then answer me."

Mrs. Willoughby involuntarily thought of that night of horror, and shuddered, and said nothing.

"Now, ma'am, just listen to this. I find

on coming here that this Italian had a priest here all ready to marry him and Minnie. If I'd been delayed or defeated, Minnie would have been that rascal's wife by this time. The priest was here. They would have been married as sure as you're born. You, ma'am, would have had to see this poor, trembling, broken-hearted, despairing girl torn from your arms, and bound by the marriage tie to a ruffian and a scoundrel whom she loathed. And now, ma'am, I save her from this. I have my priest too, ma'am. He ain't a Roman Catholic, it is true—he's an orthodox parson—but, at the same time, I ain't particular. Now I propose to avail myself this day of his invaluable services, at the earliest hour possible, but, at the same time, if Minnie prefers it, I don't object to the priest, for I have a kind of Roman Catholic leaning myself.

"Now you may ask, ma'am," continued the Baron, as Mrs. Willoughby continued silent—"you may ask why I'm in such a thundering hurry. My answer is, because you fit me off so. You tried to keep me from Min. You locked me out of your house. You threatened to hand me over to the police (and I'd like to see one of them try it on with me). You said I was mad or drunk, and finally you tried to run away. Then you rejected my advice, and plunged headforemost into this fix. Now, in view of all this, my position is this—that I can't trust you. I've got Min now, and I mean to keep her. If you got hold of her again, I feel it would be the last of her. Consequently I ain't going to let her go. Not me. Not by a long chalk.

"Finally, ma'am, if you'll allow me, I'll touch upon another point. I've thought over your objections to me. It ain't my rank—I'm a noble; it ain't money—I'm worth a hundred thousand dollars; it ain't my name—for I call myself Atramonte. It must be something in me. I've come to the conclusion that it's my general style—my manners and customs. Very well. Perhaps they don't come up to your standard; they mayn't square with your ideas. Yet, let me inform you, ma'am, there are other standards of action and manner and speech than those to which you are accustomed, and mine is one of them. Minnie doesn't object to that. She knows my heart is all right, and is willing to trust herself to me. Consequently I take her, and I mean to make her mine this day."

As the Baron paused Mrs. Willoughby began, first of all, to express her gratitude, and then to beg him to postpone the marriage. She declared that it was an unheard-of thing, that it was shameful, that it was shocking, that it was dreadful. She grew very much excited; she protested, she entreated. Finally she burst into tears, and appealed to Lord Hawbury in the most moving terms.

Hawbury listened very gravely, with his

eyes wandering over to where Ethel was; and Ethel caught the expression of his face, and looked quite confused.

"Oh, think, only think," said Mrs. Willoughby, after an eloquent and pathetic appeal—"think how the poor child will be talked about!"

"Well, really—ah—'pon my life," said Hawbury, with his eyes still wandering over toward Ethel, "I'm sure I don't—ah—share your views altogether, Mrs. Willoughby; for—ah—there *are* times, you know, when a fellow finds it very uncommonly desirable—runaway matches, you know, and all that sort of thing; and, by Jove! to tell the truth, I really admire the idea, by Jove! And, really—ah—I'm sure—I wish most confoundedly it was the universal fashion, by Jove!"

"But she'll be *so* talked about. She'll make herself so shockingly *conspicuous*."

"Conspicuous! By Jove!" said Hawbury, who seemed struck by the idea. At that moment Minnie began talking to her sister, and Hawbury went off to Ethel, to whom he began talking in the most earnest manner. The two wandered off for some distance, and did not return for a full half hour. When they did return Ethel looked somewhat embarrassed, and Hawbury was radiant. With this radiance on his face he went up to Mrs. Willoughby, leaving Ethel in the back-ground.

"Oh, by-the-way," said he, "you were remarking that your sister would be too conspicuous by such a hasty marriage."

"Yes," said Mrs. Willoughby, anxiously.

"Well, I thought I would tell you that she needn't be so *very* conspicuous; for, in fact—that is, you know, Ethel and I—she told you, I suppose, about our mistake?"

"Oh yes."

"And I think I've persuaded her to save Minnie from being too conspicuous."

Mrs. Willoughby gave Hawbury a look of astonishment and reproach.

"You!" she cried, "and Ethel!"

"Why, I'm sure, we're the very ones you might expect it from. Think how infernally we've been humbugged by fate."

"Fate!" said Mrs. Willoughby. "It was all your own fault. She was chosen for you."

"Chosen for me? What do you mean?"

"By your mother."

"My mother?"

"Yes."

"She said one of Biggs's nieces."

"Ethel is that niece."

"The devil!" cried Hawbury. "I beg pardon. By Jove!"

Hawbury, overwhelmed by this, went back to Ethel, and they wandered off once more.

The Baron had already wandered off with Minnie in another direction.

Tozer and the priest had gone to survey the house.

Seeing Mrs. Willoughby thus left alone, Dacres drifted up to her. He came up silently.

"Kitty," said he, in a low voice, "you seem sad."

By which familiar address it will be seen that Dacres had made some progress toward intimacy with her.

Mrs. Willoughby did not seem at all offended at this, but looked up with one of her frankest smiles, and the clouds of perplexity passed away. She was an exceedingly pretty woman, and she was certainly not over twenty-four.

"I'm *so* worried," she said, plaintively.

"What's the matter?" asked Dacres, in a tone of the deepest and tenderest sympathy.

"Why, these horrid men; and, what's worse, Lord Hawbury is actually encouraging Mr.—the—the Baron; and I'm *so* worried. Oh dear!"

"But why should you be worried?"

"It's *so* horrid. It's shocking. It's not to be thought of."

"But why not?" asked Dacres.

"Why, it's—it's *so* horrid!" said Mrs. Willoughby.

Dacres stood looking at her for a long time.

"Kitty," said he at last.

Mrs. Willoughby looked up.

Dacres looked all around. He then took her hand.

"Isn't it too bad," he said, "to let Minnie—"

"What?"

"To let her go through this ordeal alone?"

"Alone!" exclaimed Mrs. Willoughby, looking in wonder at him.

"Yes."

"What *do* you mean?"

"Couldn't *we* accompany her?"

Mrs. Willoughby snatched away her hand.

"Are you mad?" she cried. "I do believe the whole world's mad to-day."

"Mad!" cried Dacres. "Yes, I'm mad—insane—raving! Won't you be merciful again?—won't you, Kitty? Won't you 'humor' my ravings? Oh, do. Oh Kitty, dear Kitty!"

"It's positive insanity!"

"Oh, Kitty!"

"You're raving!"

"Won't you 'humor' me just this once—only this once?"

"Hush! there they come," said Mrs. Willoughby, suddenly snatching away her hand, which Dacres had somehow got hold of again, and moving a little further away from him. It was the Baron and Minnie, who were coming back again, while Hawbury and Ethel were seen a little further away.

There they all stood—there, on the spot where they had found the crisis of their fortunes; and as they stood there the two clergymen, Catholic and Protestant, slowly came out of the house.

THE END.

HENRY BROUGHAM.

THE most listless traveler by the great Lyons Railway would have turned to give a second look to the extraordinary person, attractive by his ugliness, who haunted that route for many years, like a grotesque bird of passage, seeking the milder climate of Cannes in the autumn, and returning with the spring to London fog. A spare, ungainly figure, galvanized with incessant motion, that multiplied itself in jerking wrinkles over a countenance like that a child bites out of gingerbread, a sharp, imperious voice, a negligent dress, touched with nationality by the unfailing plaid, completed a picture of eccentric force and conscious originality; and the natural curiosity that inquired his name would have been satisfied by the harmony between the appearance and the history of Henry Brougham.

For he looked precisely like what he was—a man who had done many great things without being great, had left nothing complete for want of concentration, and in his zeal for correcting others had forgotten to govern himself. Devoted in early days to reforms that needed no martyr, he sacrificed little, and won no veneration in carrying them out. His reputation, at one time great, came so soon in his long career that his later fame fell below it, and he seemed to grow but little after ripening. But his energy forbade him to retire from public life. Even if he had not loved to be talked about, he loved work too well ever to be idle. Besides, under all his passion for conflict and personal display, there lay an honest and hopeful faith in progress, and a purpose to drive it on in all ways that his energy could open. But the great occasions for his peculiar powers had all come up and been used long before those powers declined, and the latter part of his life was filled with action without effect.

It is not easy for this generation to realize how much Brougham outgrew, and helped the world to outgrow with him. At the time of his birth the horizon of human experience was about to enlarge suddenly and grandly, to take in new histories written by the French revolution, our own nation, and Napoleon; new sciences and inventions; new ideas of human rights, and of what it was possible and wise to do for advancing human happiness. It was by personal experience, not tradition, that he knew of the times when Englishmen were slave-traders and slave-holders; when government kept the greater part of the nation poor and left them ignorant; when Ireland was a province, and Scotland had scarcely a voice in legislation; when stern statutes branded a Catholic as unfit to rule, and hung a petty thief as unfit to live. The peers led the state as a powerful order, of which the pale

mimicry now lingers; the press was but beginning to know and afraid to use its might; routine cramped the courts, corruption ruled the hustings, and tradition, in spite of the shock it had received in a neighboring country, still overawed inquiry. The few who ventured to look into the foundations of the existing order of things in church and state had little thought of rebuilding upon them. Not that Brougham early and consciously devoted himself to this very work—few men do plan their destiny—but it was the work for which his nature fitted him; and when the hour came he threw himself into it with ardor. He was impatient of control and insatiable of knowledge. And no one better understood that the freedom and the knowledge which were the life of his own being were also the urgent needs of his nation in his time, or more resolutely sought both for the sake of communicating them to his countrymen.

There was nothing in Brougham's condition of life to make him insensible to these needs, nor any thing in his education to attach him to a class whose interest lay in neglecting them. He was born a Scotchman, among the most self-dependent people under English rule—a people very much like what the New Englanders might have become if they had remained at home. His kindred were Presbyterians, and his associates among the higher ranks of the commonalty. His maternal grandmother was a sister of the historian Robertson—a woman remarkable even among Scotchwomen for her clear sense and energy of character—and his early years were passed under the influence of her strong intellect and correct judgment. There was a vague claim in the family to descent from De Burghams of the Conqueror's date, and a still more slightly grounded belief in a connection with the Norman barons De Vaux. His own memoirs, speaking of his many respectable ancestors, betray no trace of a weakness for high descent, and there was nothing in his social surroundings to nurture it. What was better than quarterings or manors he did derive by direct descent from his grandmother—her active mind and resolute will. But some freak of nature withheld the steadiness of judgment for which she was noted; and also bestowed on him, instead of her singular beauty, a rare and interesting ugliness, which grew with time only more elaborate and startling. Brougham was precocious, quick at learning, and an eager devourer of all sorts of books, as well as ready and stinging in speech, and combative from the very first. The society of Edinburgh in his youth was fitted to develop these qualities, and yet to teach their possessor due modesty. There were accomplished men in all the professions—hard-headed Scotchmen, conscientiously trained; there were teachers in the Universi-

ty, ardent in the pursuit of scholarship and of such science as was then known, and eagerly followed by numerous pupils; there were young men of good family depending on their brains for bread and fame, many of whom kept up an equal race through life with Brougham in their several courses. Instead of the splendor of a court and the excitements of a metropolis, there was a court of intellect that envied London nothing, and a modest equality of life favorable to the formation of solid character.

Brougham, though an unremitting student, was no dyspeptic bookworm. Vegetarians and abstinents he would have laughed to scorn, as Luther did, all his life long, for he was too healthily endowed to make his diet a conscience for his morals or his mental workings. After an evening spent among his keen-witted friends at their Speculative Society in debating philosophical or political questions, he would hold his own with some Counselor Pleydell over a potent Scotch brew, or finish a rollicking night with a raid upon the knockers and signs decorating the sea-green doors of the New Town. The interval between the end of his college studies and his serious adoption of his profession he spent in a cruise among the Hebrides—no tour of picturesque and antiquarian research, like Johnson's, but a long sea frolic, given up by day to the fatigues of hunting, and relieved by a hearty carouse at night. Neither his sense of discretion nor his digestion suffered any shock from such overflows of spirits, for at the age of eighty-eight he reflects with exultation on these pranks of his boyhood, only regretting them because they were past. Indeed, the union of Scotch toughness with English heartiness made Brougham always convivial, a leader of the revels on circuit, and a deeper drinker of claret than any of his ministerial associates at a time when, though four-bottle statesmen like Pitt were departing, yet Catos of the cabinet, such as Gladstone, had not arrived. But neither the bitter enemies nor the light swarm of caricaturists, whose mark he was for many years, ever seriously accused him of excess.

His early mental bias was strongly toward science, and his first efforts for literary distinction were made in that field. While in his teens he contributed to the Transactions of the Philosophical Society a paper on the Newtonian theory of light, and another on an obscure topic in geometry. In later days he thawed the reserve of Carnot, while at Paris, by a discussion on fluxions; he was accused, in the midst of political strife, to plunge every year for a few days into mathematical amusements. Later still, he was a member of the French Institute—awakened to his merit after it shone from the wool-sack. He took intelligent note of the marvelous development and organization at-

tained by human research in that direction during the long period covered by his life. But though himself penetrating and observant, it is doubtful—such was his want of patience and accuracy—whether he could ever have become a leader in scientific inquiry. A more complete and congenial distraction from the impatience besetting him in the days of his early slow progress in his profession was found in the establishment of the *Edinburgh Review*.

The time and place were both favorable to the creation of a new means of expression for liberal thought. The Northern capital had attracted so many scholars and accomplished men from the Continent, disturbed by war, that it had become one of the intellectual centres of Europe. Government was in the hands of a narrow and violent section of the Tories during Pitt's estrangement from the king on the question of Catholic Emancipation. They ruled in Scotland with insolent exclusiveness. There was no criticism of literary work except such puffs or attacks as publishers paid for and dictated. Both the repression and the perversion were intolerable to the circle of high-spirited and intelligent young Whigs among whom Brougham moved. They conceived the plan of a quarterly publication, expressly designed to attack abuses and to liberalize the tone of thought in politics and literature, letting religion alone. The first suggestion was certainly Sydney Smith's, and it is said that Brougham's co-operation was opposed on account of his rashness, and afterward invited from fear of his powerful enmity. His own account represents himself as one of the four originators, with Jeffrey, Horner, and Smith. These four wrote the whole of the first few numbers, Jeffrey acting as editor; and before long the most accomplished men of the kingdom, in all ranks and pursuits, joined its contributors. The success of the *Review* astounded its projectors, and inspired them with a dash and confidence that often ran into recklessness and arrogance. It brought together the most advanced thinkers of the time, and harmonized and diffused their views, while it provoked discussion, and raised up a host of strong competitors. It did incalculable service to the Whig party and to the cause of freedom throughout the world. On the Continent it was an authority for English state affairs—Jefferson never failed to consult it—and the government learned to heed it as the voice of the most enlightened public opinion. Its services to science and literature, too, were not less important. Its judgments were always sharp and decided, never uncertain, and though on some occasions harsh or mistaken, were yet founded on knowledge of the subjects treated, and on true canons of criticism. To the best of its ability it suppressed incompetence, and fos-

tered rising genius; and its early blunder in assailing Byron, for which Brougham is personally to blame, though Jeffrey bore the responsibility of it, was not repeated when the time came to pronounce on the merits of Macaulay.

Whatever part Brougham may have had in the paternity of the *Edinburgh Review*, his labors in its support were immense and varied and long continued. For the first four numbers he wrote twenty-one articles, and on the first twenty his work included eighty papers, Jeffrey contributing seventy-five, and Smith twenty-three. Brougham was a capital reviewer. His constant omnivorous reading and wide acquaintance provided him with ample material, and he laid all persons and occasions under contribution. He would "swallow a book whole" in his walks on one day, and by "an exertion about midnight," among social engagements, contrive to send it down to Jeffrey depicted and commented on. His style was vehement and eloquent, but by no means correct, nor always in good taste. As his career widened, the *Review* gave him a field for discussing the public measures to which he was devoted. His serious papers, inspiring thoughtful minds with philosophic views, were an admirable complement to their enforcement by more popular arguments in his speeches in Parliament. This twofold device of unfolding as a publicist the topics which he urged as an orator doubled his party influence, and no doubt contributed powerfully to his political advancement. So that, without any personal views or interested purpose, he found in the maturity of the *Review* ample reward for the care and labor he had bestowed on its establishment.

Brougham was twenty-seven years of age when he exchanged Edinburgh for London as a residence. The only requisite for admission to practice—that of dining five days during each term in Lincoln's Inn—he had complied with for two years, and in 1805 he transferred his domicile to the Southern capital, where he was called to the bar in 1808. He cultivated close relations with the Whig peers, and attended the debates in the House of Commons oftener than the courts, diligently writing for the *Review* while awaiting practice. In society he soon became popular from his conversational powers, and a little feared for his sarcasm, "being courted both for what was pleasant and what was formidable about him." But his professional progress was very slow, and his practice limited at first to Scotch appeals. Although a favorite with the bar, as in society, he interfered little with the success of rivals there. His manner of argument is described as failing utterly in tact, wanting precision and clearness in details, and finish and unity in the whole, though displaying great compass of

mind and much industry. But those who knew him best already foresaw that want of steadiness and discretion would mar the effect of his brilliant powers. In truth, a political career was that for which Brougham was best fitted, and by coquetting all his life long between that and the legal profession, he missed the highest reputation either in the senate or the forum. Even at this early period he deserted practice for a few months' service as secretary of a diplomatic mission to Portugal, from which he gained nothing but a closer connection with the Whig leaders. The *mot* invented for him, that "if he only knew a little law he would know something of every thing," was as unfair as it was pointed. He did know a great deal of law as a science, but he lacked the patience and concentration to organize his knowledge for effective daily work. In those larger controversies with which courts least often deal, requiring the application of legal principles to vindicate human rights or direct public policy, Brougham's ardor and fullness made him pre-eminent, but Parliament was the arena for these discussions.

He had already made his mark in the management of a great cause at the bar of the House of Lords. The merchants of Liverpool employed him to plead for the repeal of the Orders in Council forbidding exports to the Continent, which had been provoked by Napoleon's extraordinary decrees declaring the islands of Great Britain in a state of blockade, and all British goods, wherever taken, lawful prize. The discussion involved details of political economy, and covered the ground of neutral rights and of the limits to a free government's power in interfering with private interests. The effort failed, and the repeal, considered by Brougham the greatest achievement of his life, was not carried until four years later—too late to prevent the war with America, which he had deprecated as one of the evil consequences of the Orders. But the occasion fixed his fame as an orator, and assured him public distinction. Yet it was not until his impatience at the delay occasioned by want of confidence in his stability was set at rest through his nomination as member for the rotten borough of Camelford that his real career opened before him, at the age of thirty-two.

The new member astonished every one, first by keeping complete silence for a month, and then by his mild and temperate maiden speech on an unimportant motion, that might have been enlivened with personalities. But the restraint on his fluency and his sarcasm alike was soon laid aside, and for the future he was never in his place for a whole evening without taking part in debate, and never denied himself, when tempted, the pleasure of vituperation. Brougham continued in the House of Commons, with the exception

of four years, until he was raised to the wool-sack in 1830. He at once conquered a commanding position, and but for doubts of his discretion and sincerity, might have become the acknowledged leader, as he was intellectually the strongest man, of the Whig party. His capacity for work was unbounded, and his energy prodigious. He took part in every debate originated by others, and brought forward constant motions himself upon subjects of every variety. His eloquence on set occasions poured forth ardent and impetuous, impressive at times, but too often turgid, and weakened by excessive elaboration. Toward his political colleagues he indulged in familiarity that bordered on disrespect; and his want of dignity, ill-matched with his frequent arrogance, aided not a little to defeat his aspirations after leadership. Though a good hater, he did not gain the credit of being a warm friend; and while his party fidelity was beyond doubt, he could be alternately cool and cordial with those of his own politics and with their opponents alike.

The grossest of those contradictions to English theories of freedom, and those anomalies in English practical life, which shocked Henry Brougham's sense of justice, and demanded his interference as a legislator, was the existence of slavery and the slave-trade. We look back at slavery as it then was through half a century of enlightenment, and through the misery we endured after conviction had failed to work repentance in ridding ourselves of the burden, and wonder how a strong and free government, not constitutionally framed in part upon the system, could ever have tolerated it. But the early English abolitionists had to awaken a dull moral sense, to convince minds by arguments almost new, and to assail interests which seemed to benefit and not endanger the state. Brougham had become intimate with Wilberforce, and closely connected with his party of "the saints," during his early days in London, and the great liberator, declining in years, surrendered to him the task of carrying out his views by effective legislation. Much had already been done. The last act regulating the slave-trade had been passed twenty years, and the first act for its abolition three years, before he entered Parliament. But the abominable traffic was still carried on by British subjects with ingenious evasions and increased cruelty. Four months after taking his seat Brougham moved an address to the crown on the law in an admirable speech, branding the slave-traders as men who drove crime, not commerce, and lived by treachery and murder. His treatment of the subject raised him at once to high distinction, and the following session he completed the suppression of the iniquity by carrying a bill declaring slave-traders guilty of felony.

Many years were yet to pass before Parliament, delayed by fairer pleas in support of a less glaring wrong, crowned the work by abolishing slavery in the colonies. The struggle was earnest and bitter on both sides. Philanthropy spared no violence of invective, and interest no appeals to the peculiar English sense of justice toward vested rights. The phrases of such a contest are too familiar to us, who accepted at the outset of our reform principles which were then first to be established by the disputants. But the powerful arguments drawn from commercial prosperity met only doubtful answers, which even the result to the colonies has scarcely confirmed. Abstract right found it hard to meet the plea of eighteen million pounds annually drawn from slave investments in the West Indies, of which four millions went to swell the public revenue. The Parliamentary interest of the planters and the merchants depending on them long held irresistibly together. The anomalies then existing in legislative representation doubled the power wielded by these classes through their wealth and social connections. The Jamaica planter makes the same figure among his dazzled neighbors, in the plays and novels of the day, as the East India nabob did after Hastings's time. Great sums were held in mortgages upon his plantations, and he returned to his native country to enlarge his acres, to trade with seats in the House, and control appointments for the colonial service. The fate of England in Europe was supposed to be mysteriously bound up with that of her tropical islands, and these, in turn, to depend for their existence on slavery. But the combined and desperate resistance of all these interests, private and public, political and pecuniary, was of no avail against the resolution of the reformers. Brougham fought all their battles with restless energy and profuse fluency; and at length, in 1833, slavery throughout the British dominions ceased by act of Parliament, and the trained tactics and virtuous vituperation which had no longer an object at home were turned upon the United States. Brougham is fairly entitled, in spite of the sneers of his enemies at the claim, to be considered as the head in Parliament of the liberating party.

The distinction, however, cost him a fortune. In 1828 a Mr. Shakspeare Reed, a very wealthy person of Durham County, wrote to inform Brougham that, in consideration of his public services, he had made a will leaving him his property. A few years after he wrote again, appealing to Brougham, as his heir, to use his influence "to put down the political set of pretended philanthropists who were seeking the emancipation of slavery in the West Indies." Brougham replied that he had applied to the wrong quarter, and recommended to him to read a report on

the subject, which he inclosed—and Mr. Reed altered his will.

Another ancient and bitter controversy, smouldering when Brougham entered the national legislature, was that upon Catholic Emancipation. On its renewal, thirteen years after he became a member, he ranged himself, with his usual ardor, among the combatants on the only side of the question it was possible that he should choose. It divided the people and the cabinet nearly equally. But neither his horror of the mass, imbibed with his Scotch Presbyterian education, nor his zeal for the spread of knowledge, to which that Church was no friend, lessened Brougham's hatred for the wrong and injustice done to great numbers of his countrymen under the excuse of their religion. He felt the inherited disgrace to the nation of disabilities that had long outlived their historical reasons. He saw with indignation men, the equals in social consideration, in virtue and patriotism, of England's best, under a ban. He feared for the explosion which Ireland, mined by intrigues fomenting just discontent, stood on the verge of. Those terrible memories left by the reaction under Mary from the Reformation had once before so far died out that Roman Catholics sat in the Parliaments of the second Charles. The new, stern restrictions confirming the settlement of Great Britain as a Protestant kingdom in 1688 had been relaxed a century later to allow Catholics to vote, to become magistrates, and enter the army and navy and the professions, so that more disabilities were removed than remained behind. But what remained were unworthy of modern enlightenment. If it was safe to yield so much, it was not only safe to yield all, but unsafe to hesitate about it. "Confidence is better than coercion," was the generous watch-word under which Brougham, in powerful speeches and frequent articles, advocated the most liberal measures for the relief of the Catholics.

The revived struggle engrossed public attention for six years. In the previous reign Pitt had staked the premiership upon the question, and resigned office when he failed to open the king's purblind eyes to his obstinate misreading of his coronation oath. George the Fourth, less honest rather than more liberal, had played with it as a scarecrow to manage his cabinets, until the game grew too dangerous. The pledge of silence on the subject given by Canning when made Secretary of State brought upon him a furious attack from Brougham, which Canning passionately answered by the lie direct. The scene of elaborate explanation that followed suggested to Dickens his diverting theory of insult given and taken in a Pickwickian sense. Canning's silence was as ineffectual as the continued hostility of the new ministry under Wellington and Peel, who saw

themselves compelled by the dread of civil war to bring forward the measure they had hitherto violently opposed—not the first nor the last instance in English politics of statesmen occupying the popular ground pointed out by their adversaries to keep them away from it. The act for the relief of Roman Catholics passed the Lower House once in 1825, but their full emancipation dates only from 1829; nor are they to this day allowed to hold property ecclesiastically in England. Brougham gained his full share of the honors of the triumph, and counted his labors in this cause among the most important of his public services.

There came to Henry Brougham, the advocate, in the ripe vigor of his powers, and as if to crown his rising reputation, one of those rare occasions on which the greatness of the client and the cause give wide and lasting fame to the defender of innocence. The Queen of England was brought to trial by her husband, before the most august tribunal in Europe, on charges of infidelity, made in support of a bill to deprive her of her rights as queen-consort, and to dissolve the marriage. This proceeding was the culmination of a long series of cruel and unmanly persecutions, beginning with rudely expressed repugnance to a marriage imposed for state reasons, and inflicted through more than twenty years of alternate neglect and insult. The queen, as Princess of Wales, had been surrounded with spies, her correspondence violated, intercourse with her daughter denied her, and foreign powers invited to treat her with disrespect. The prince never pretended to conceal his hatred for his wife, treating her on all occasions with contumely, refusing to receive her associates, and seeking by every petty expedient to annoy her. Contemptuously careless of his conjugal duties, he succeeded in driving her to disregard hers, and to quit the kingdom for a life of travel, which offered too notorious grounds for charges of levity and indecorum, though proofs of any guilt were sought in vain. Brougham had personally known the princess for ten or twelve years, and had long been her trusted adviser, guiding her course and that of her daughter, Princess Charlotte—"Young Princy," as she was called in the clubs—with great tact and discretion throughout the difficulties forced upon them by the Regent's ill-will, and the constant quarrels among all the royal family.

While the close of the long reign of George the Third was daily expected, a commission had been employed at Milan, the Princess Caroline's residence, in collecting evidence against her. "For half the money spent on the trial," Byron wrote, "any corrupt testimony whatever might be brought out of Italy." After her husband's accession, in 1820, he threatened that if she set her foot on En-

glish ground she should be arrested, committed to the Tower, and tried for high treason. His hated wife was by any means to be got rid of. She should neither be crowned with him nor prayed for with him. The first act of the new reign was to direct, in denial of her clear right, the omission of her name from the petition for the royal family in the Liturgy. Learning this by accident from the public journals, she wrote to the Prime Minister, complaining of her wrongs, and by a detailed account of all her ill usage, created a strong sympathy in the public mind. After using her prerogative as queen by appointing Brougham her attorney-general, she came with all speed to England, landed at Dover amidst the applause of an immense multitude, and journeyed in a triumphal procession to London. The king, in great alarm, insisted on violent measures. His ministers shrank from the scandal of the investigation, the danger of public sympathy, and the certainty of recrimination. A few days of fruitless negotiation followed; the queen refused to retire from the kingdom unless her name were restored to the Liturgy; and the bill for her degradation and the dissolution of the marriage was brought into the House of Lords.

In the contest that followed power was not all on the king's side, nor right all on the queen's. She had been imprudent, familiar with questionable society, and culpably careless of her dignity. But the public voice was loud in her support; if her profligate wrong-doer accused his victim, the people would care nothing even if the case were proved, and would stand between her and her persecutor's injustice. Strong in this conviction, animated by the greatness of his cause, and excited by the eager expectation of all Europe, Brougham managed the defense with a boldness and skill that made the king tremble, and gained for himself immortal renown. His opening speech to the peers upon the manner and time of the proceedings amazed them by its defiant and sarcastic vehemence. He plainly threatened, if the trial should proceed in its present form, to drag to light the gross immorality and profligacy of the king, as defeating his right to a divorce. But his strongest argument would have been found, as he states in his autobiography, in branding the king as a bigamist. Whatever dangerous questions as to the succession to the throne that course might open, he was prepared and resolved, if driven to it, to establish the king's marriage with Mrs. Fitzherbert, a Roman Catholic, before he had taken Caroline as his wife. In spite of the threat the feeling of the House was in favor of proceeding, and the crew of bought and bribed witnesses for the prosecution were introduced. Brougham assailed the contemptible character of these tools, and overwhelmed their mendacity and con-

traditions. The chief witness, Majocchi, a postilion, was beaten into such a state of dismayed stupidity that at last his monotonous reply to all questions became the *non mi ricordo* which has passed into a proverb. Answering the assertion that the king's private character had nothing to do with the bill, which was a public measure of the government, Brougham caught adroitly the suggestion of a friend, and exclaimed, "Who, then, is the prosecutor? Who is this mysterious being

"that shape hath none,
Distinguishable in member, joint, or limb?
....What seems his head,
The likeness of a kingly crown hath on?"—

declaiming the quotation with immense applause. After the prosecution had closed, an adjournment of three weeks was taken, during which time public feeling rose more and more indignantly in favor of the queen. In the interval Brougham carefully prepared his great speech for the defense, writing over the peroration seventeen times. The composition is too elaborately modeled by rule; as read in print, it smells too strongly of the midnight oil. But during the two days of its delivery the effect produced was powerful. His conclusion was solemnly impressive, in spite of its imitation in gesture of that worst school for the graces of oratory, the Scotch pulpit. The proceedings continued for several weeks longer, but the bishops and some temporal peers having scruples as to the righteousness of the divorce clause in so peculiar a case, upon the third reading of the bill the majority in its favor was reduced to nine. This was the exact number of ministers and other high officers in the House, and it would not do to pass such a measure by their votes. The bill was accordingly withdrawn by the government, and the prosecution failed even before going to the Commons, where there was not a shadow of hope for its success.

This equivocal result of the trial gratified the popular hatred of the king as deeply as an acquittal could have done. The defeat might seem to sully the royal honor, if that had not long ago ceased to be possible. Conduct that would have been dirty in the lowest of his subjects looked ineffably vile when it betrayed how, among all the royal shams, the most basely false was the claim to gentlemanhood. The king long nursed malignant spite against Brougham, and Denman, his associate counsel. He believed that the latter disguised the darkest suggestions of crime in the comparison made between his client's persecutor and Nero, while he actually fancied that the former chose the famous quotation from Milton to convey an unhandsome slur upon the symmetry of the royal legs. Both were denied for many years the promotion usual for barristers of their standing to the dignity of the silk

gown, the distinguishing dress of a king's counsel. Brougham enjoyed more solid honors in his immensely increased reputation and popularity, the sudden and permanent enlargement of his practice as to all cases of public interest, and his confirmed ascendancy in the House of Commons.

But the greatest of Brougham's achievements in the service of his country was yet to come. The subject of Parliamentary reform had long ago attracted his earnest study. He saw earlier and felt more deeply than routine statesmen did that the people of England were very imperfectly represented in their legislature, and that the form of government—the expression of that antiquated and heterogeneous mass of precedents and enactments known as the British Constitution—needed to be remoulded in accordance with the growing influence of the commonalty. England, in fact, knew little of popular representation. Dissenters and moderate property-holders had no votes. Great manufacturing towns, the creation of modern times, sent no representatives. More than a hundred and fifty members of the Lower House were nominated by the peers through the system of rotten boroughs which they controlled. Old Sarum, without inhabitants, sent as many members as the whole of Yorkshire. In the English counties freeholders monopolized the votes; and those of Scotland, by the abuse of an electoral fiction, were as little independent as the boroughs. The absurd and incongruous system had degenerated into so mere a mockery of representative government that no one with any pretension to political wisdom could approve it, and only the fear of change that perplexed statesmen kept it in existence.

The approaching close of George the Fourth's reign quieted party strife in Parliament during the year 1830; and so little public interest was then felt in the subject that hardly a petition upon it was presented at that session, and wise men supposed that for many years it would continue the topic for talk of eccentric enthusiasts such as Brougham.

In June the king died, and the new sovereign dissolved Parliament. In July revolution raised the Citizen King to the throne of France, and England burst into a flame for popular rights. The great county of York, the largest and most intelligent constituency of the kingdom, invited Brougham, with no property nor local connections among them, but admired for his brilliant talents and zeal for liberal principles, to represent them at Westminster. His untiring energy during the three weeks of the canvass exceeded belief. He was then attending the assizes, and employed in many cases. Day after day he would address a jury, hurry out of court to harangue the electors, return to make an argument, and post off at evening to deliver a

speech in some town or large village, visiting all within the county. He conducted the canvass without bribery or any of the arts of the demagogue, and the unsolicited honor of his return was the proof that he was the fittest man to guide the destinies of his country.

The Duke of Wellington, then premier, had not the civil wisdom to read the signs of the times. In opening the session he pronounced the representative system to be "absolutely perfect, liable to no censure, and capable of no improvement." A ministry with such a head could not stand against the national disaffection; and a fortnight after the speech the Whigs came into power, under Earl Grey, and Brougham received the Great Seal, and took his seat as chancellor and his place as Speaker of the House of Lords. Brougham's original draft of the Reform bill, retaining the boroughs, was not acceptable to his colleagues, who introduced a more sweeping measure. It passed the Commons by a majority of only one; and another general election was resolved on. The scene of dissolution was one of immense confusion, several peers speaking at once, and looking as if ready for blows, the chancellor in a state of distraction, and the king, on his arrival, showing evident signs of anger with his refractory councilors. The new House contained an overwhelming majority for "the bill, the whole bill, and nothing but the bill." They passed it promptly, and on its second reading in the Upper House Lord Brougham supported it in a magnificent speech, displaying wonderful power of intellect, memory, and dexterity. One who reads it now fortunately escapes the theatrical trick which impaired its effect, as he knelt at the close, and remained so long in that posture that, it is said, his friends at last picked him up and set him on the wool-sack again. The peers nevertheless rejected the measure, at daylight after the fifth night of debate, and the session closed, leaving the country apparently on the eve of revolution.

At the coronation of William the Fourth, which took place during the recess, the applause that saluted Lord Brougham, as he advanced to pay homage to the king enthroned in Westminster Abbey, was so loud and general as to make the vaulted roof echo. A new Reform bill passed the Commons at once on their re-assembling, and was again furiously resisted in the Lords, and again powerfully supported by Brougham. But to insure its success the Whigs were forced to threaten a novel step, of doubtful constitutionality, and certain danger to the state if it had actually been taken. They respectfully represented to the king that the bill could not pass without the creation of a sufficient number of new peers to command a majority. He shrank from the effect of a dis-

guised *coup d'état*, and refused the demand. Earl Grey's cabinet thereupon resigned, and during its short suspension Brougham addressed all his energy to raising a storm of petitions, pamphlets, and meetings all over the island, while controlling tumults and regulating public excitement—unchaining and guiding the political elements like a very Prospero.

There had been no such crisis in England since the days of James the Second. Hundreds of thousands of men in the great provincial towns were ready to march to London and sacrifice their lives for the bill, and the danger of civil war was serious. The duke, though forced to bar Apsley House windows with iron, gallantly undertook to form a cabinet from second-rate men, the only ones, except Lyndhurst, whom he could find willing to face the storm. But an appalling explosion of popular opinion condemned the attempt, and after five days of retirement the Whig ministers resumed their places and their policy. The threat of swamping the House of Lords by extemporized peers—of whom a list to the number of fifty was actually made out—proved sufficient. The duke advised the absence of Tory peers from the House during the subsequent discussions. The bill passed in the summer of 1832 by a majority of eighty-four, and the cause of Reform had a complete triumph, of which Brougham reaped most of the glory. He had reason for satisfaction with the result that thus crowned his long and arduous efforts. The bill was a step toward democracy, that introduced the middle classes into the government, with the result of ripening into the reform, in 1868, which brought in artisan labor to a share of power.

The hybrid office of Lord High Chancellor of England, with its mixture of political and judicial functions, was well adapted to display Brougham's varied powers and employ his feverish activity. He cared little for the emoluments, but much for the immense patronage of the place. As it was the office that best suited him, so it was also the only one that his Whig friends were disposed to give him on the formation of the Grey cabinet. They feared his insubordinate and impracticable temper, but feared still more his power and enmity if excluded. After the passage of the Reform bill he expected, with apparent reason, in the total rout of the Tory party, that his own term of office, as the apostle of Liberalism, would be as long as he could desire. But sound sense almost reached second-sight in the answer of his mother, when he took the earliest occasion to visit Brougham Hall and ask her blessing: "Ah, my dear Harry, I would rather have embraced the member for Yorkshire." He held the office only one day less than four years. In 1834 the Whig ministry was dismissed, owing rather to the blunders and

general prostration of the party than to the king's personal feelings. Yet it is certain that he did not like his chancellor. He was offended with his undignified and surprisingly disrespectful manner toward himself; he resented the nonchalance of his correspondence and talk while traveling about the country with the Great Seal in his pocket, contrary to all the traditions of state; and he is even said to have declared that "he never wished to see his ugly face again."

His own confidence in his fitness for the judicial branch of a chancellor's duties was shared neither by his friends nor the unprejudiced public; yet Brougham's genius, his general knowledge of jurisprudence, and his ceaseless industry and energy, carried him through with distinction. Though far from redeeming his boast that the decisions *tempore* Brougham should be revered as Lord Hardwicke's were, he commanded the respect of the bar and the public by his satisfactory disposition of the cases that came before him. Sitting in the House of Lords, his early training was of great service to him in the decision of Scotch appeals, as to which his authority was undisputed. In his own court, the late and constant sessions he pressed rather annoyed the profession, unused to such hard work in that tribunal; and his uncivil habit of reading and answering letters while on the bench cost him some sharp reproofs. On the whole, his reputation for great and varied ability rather gained by the manner in which he filled his high place as chancellor. But the estimate of his character which made his party friends hesitate in calling him to the office was justified by his undignified conduct in leaving it. He sent back the Great Seal to the king in a bag, instead of solemnly delivering it up in person, according to precedent; and he attempted to bargain with his successor, Lyndhurst, for the office from which the latter was promoted to re-occupy the wool-sack.

In the disgust for his profession expressed by Brougham when entering it there was something deeper than impatience and restlessness. His intellect was too strong and clear not to be at once attracted by the science of law, and offended by the distorted and antiquated systems through which it was applied to the business of life in his own country. Official experience brought before him in striking review the cumbrous anomalies of both English and Scotch practice. The reforms he effected in his own court were only steps in a course of improvement he had long considered and advocated. The flagrant abuses in chancery had been discussed five or six years earlier, but the dubitating and deferring Eldon long staved off interference; and when a commission of inquiry was at last appointed in spite of him, it slept over the evils until Lyndhurst be-

gan and Brougham completed many needed improvements. Several years before, while in the Lower House, he had laid a vigorous hold upon the subject of general law reform, and afterward, in 1828, he treated it with his usual fullness and power in a speech, of interest now only to the professional reader, but admired then as one of his most surprising performances. He recommended the appointment of two commissions, whose reports were followed by various acts of Parliament, greatly simplifying and improving the system of English law and practice. The subject continued through his life to be one of his favorite hobbies. Session after session he introduced it in motions and speeches. In 1845 he brought in on one evening nine new bills of amendment, and so late as 1852 he was still industriously at work framing criminal codes, filling the *Law Review* with papers, and the Law Amendment Society with speeches. So many years of effort exhausted neither his topics nor his energy; new occasions were ever arising for new plans to bring the law nearer to the height proudly claimed for it in its most unreformed state, as "the perfection of human wisdom."

There was another field for labor in elevating the condition of his countrymen which Brougham may almost be said to have opened, and in which he was a constant, leading, and far-seeing worker. To the cause of education, without hope of other reward than fame and the sense of doing good, he gave his most mature reflection and sober action, free from the caprice and passion that so often disfigured his political life. When coining the famous phrase, "The school-master is abroad," first used in a speech attacking the union of civil and military powers in the Duke of Wellington, he might fairly have added that he was himself the chief instrument in sending him forth. In England, the country of class and privilege, far more than in Scotland, high mental training was a luxury reserved by the universities for the socially established members of an established Church. Further than this the advance in learning of the middle classes was no concern of the state, and the poor suffered the neglect of their minds, among other more cruel forms of neglect, without even knowing how to complain of it. Brougham was too ardent for knowledge himself, and too well convinced of its advantages in every condition of life for others, to be satisfied that a few should engross it, and even of these only a few imbibe it liberally. Whether or not all that he did in the cause he had so much at heart was wisely done—whether or not his views, as since developed by others, may have helped to diffuse that "vast and various misinformation" which satire imputed to him with more than its usual fairness—it is certain that his honest

and constant efforts for general education have borne much fruit that England and the world have to thank him for. He began at the basis by moving in Parliament in 1816 for a committee on the state of education among the London poor. In 1819 he established the London model school, and three years later he conceived the reformation of the universities and public schools, and meditated a system of instruction for all the lower orders. But special and separate reform is impossible for the universities, which are an element in the religious governing system of England, and can only improve by sharing in its slow modification. What he could not amend he fancied he could replace, and therefore, in 1825, he effected the foundation of the London University, relieved of all religious tests and preferences. The poet Campbell declared that the idea was borrowed from him, but Brougham has the merit of bringing the mere fancy into form and life. Two years later the need of a new sphere of action for his still enlarging views led to the creation, under his presidency, of the Society for the Diffusion of Useful Knowledge, and to the commencement of those interesting and world-famous publications, the *Penny Magazine* and the *Penny Cyclopaedia*. His "Essay on the Objects, Pleasures, and Advantages of Science," introductory to the society's publications, has become a classic, and been honored by translation into all European languages. The deserved reputation that followed upon these various labors has stimulated others to continue and extend them, leading to the present state of things in England, where the education of the country is conducted by boards elected by the ballot in its most improved and approved form. And these acts of his public life above all the rest have fairly won the praise he claimed for himself when proposing law reform. "One power do I prize—that of being the advocate of my countrymen here, and their fellow-laborer elsewhere, in those things which concern the best interests of mankind."

His election for Yorkshire, the gift of the Great Seal, and the glory of the Reform bill following closely upon each other, raised Brougham, in his fifty-fourth year, to the crowning point of his public career. He was then the foremost man in England, and enjoyed greater supremacy and popularity than any chancellor since Woolsey's time had gained. His court, usually empty and dull, was crowded when he sat, admiring mobs cheered around his carriage, the freedom of corporations and testimonials were showered upon him, and plaster images of his striking face were ordered for sale faster than they could be made. The press continued to bear him up on its strong wings. The *Times* was called his organ; even the Tory journals praised him, subsidized by his

patronage. For a moment he grasped power, but with too restless and unsteady a hand to keep firm hold on it. In a very few years his own eccentricities and imprudences did more than all the blunders of his party to forfeit public esteem. Before he left office the *Times* turned against him upon a personal quarrel, and for long years after assailed him with a bitter mixture of true and false charges. His attempt, on the retirement of the Grey cabinet, to bargain for an exchange of offices with his successor, Lyndhurst, brought down severe public censure. Reckless and impetuous, he had cared little for preserving the friendship of persons or classes. He could be unceremonious at a levee, and rude in Parliament. He could not resist a coarse fling at the attorneys, or a rough jest on the bishops, who, if too meek to answer, were human enough to remember. The hope of return to office with the Whigs encouraged him while they were excluded; but on regaining power, after a few months' retirement, they dropped so dangerous an ally, who would be formidable as an enemy, but certain destruction as a friend. He never forgave the slight, which seriously affected his health and mind, and devoted years to revenge. Thenceforward he belonged to no party, by turns attacking and siding with Whigs, radicals, or protectionists, while proclaiming his own consistency. Their leaders accepted his aid, as they would the irregular services of a Cossack, expecting next day to feel his lance in pursuit, yet dreading his sarcasm, and courting his unquestioned power. His stalwart frame, his keen gray eyes, and stern face, on which, as in a book, "men might read strange matters," showed like a portent, now from the ministerial benches, now from the opposition, and now from the edge of the wool-sack, where, in his intervals of amity with Lyndhurst, he loved to perch. The hard aspect of the Scotch-born ex-chancellor contrasted strangely with the American-born chancellor's superbly handsome face and courtly manner. His fluency and activity seemed to grow with his years. In one session he poured out as many words as an ordinary man would utter in a lifetime, making two hundred and twenty-one speeches on fifty-six important subjects. His voice was harsh, cold, and unsympathetic; his gestures furious, almost gymnastic, his hands now plowing his hair, and now jerking at his plaid trowsers. O'Connell wrote, "I pay very little attention to any thing Lord Brougham says. He makes a greater number of foolish speeches than any other man of this generation." Lord Campbell declares that so active, adventurous, and unscrupulous an assailant was not recorded in English party history. Macaulay called him a "turbid rhetorician," and laughed at the *Broughmee* which he spoke for French. His

extravagances displeased our stately and solid Webster, who yet conceded his power and integrity. The hostile reviews of Edinburgh styled him the great equivocator of the age, noted for cool, deliberate, rancorous insolence. He continued to be the chosen target of the press, drawing on himself the bolts of the *Times* and the needle-arrows of *Punch*. The latter reflected in cartoons and quips the public amusement with his restless displays, presenting him now as king's fool to Canute, again as Cupid in the judgment of Paris, and again as a tremendous "chase in action," going through his *poses plastiques* on the tight rope. No one less elastic than Brougham could have outlived the savage rancor of the obituary notices that followed his reported death in 1839, nor the storm of ridicule that greeted his attempt to become a French citizen, and commit political bigamy, after the revolution of 1848.

In his domestic life Brougham was affectionate and tender, reverencing his mother, who died in 1839, and strongly attached to his brothers, whom he brought into the public service without undue favoritism. He was married in 1818, and long outlived his wife and his only child, a daughter, whose memory could move him to tears, and whose name, Eleanor Louise, he gave to a property he purchased at Cannes, on the Mediterranean shore of France, in 1840. Here he spent the winters, returning for the opening of Parliament, and when it rose repairing to Brougham to entertain hospitably until the Westmoreland fogs and rains drove him again to France. He would then visit Paris, paying his respects to the Institute and to the ruler who happened to be on the throne or in the chair, and return after a few weeks to his neighbors at Cannes, who held him in high regard. In 1860 a peerage, with descent to his collateral heirs, under the title which he had taken as chancellor, was granted him "in consideration of his eminent public services." He died at Cannes on the 7th of May, 1868, having reached the extreme age of ninety.

Lord Brougham's faults were of such a kind that they injured himself rather than those they offended. With more logic of mind than of character, he wanted the steadiness of principle to increase or even to maintain the fame early gained by his genius and labors. The generation that revenged itself for his caprice and passion by depreciating his merits has passed away, and the settled judgment of his countrymen now approves the opinion recorded long ago by Romilly: "Brougham is a man of the most splendid talents and the most extensive acquirements, and he has used the ample means which he possesses most usefully for mankind. How much is it to be lamented that his want of judgment and prudence should prevent his great talents and such good intentions from being as

great a blessing to mankind as they ought to be!" If Brougham had lived but half the years that fell to his lot after reaching manhood, he would still have left a name famous in the history of the world's advance. He taught Englishmen, in the several great labors of his life, to be humane, tolerant, self-dependent, and intelligent. By judicious reforms he helped the institutions of his country to express more exactly the new spirit of the age; and in such harmonious adjustment of the ways to the objects of national life consists the statesman's true secret of progress.

THE DARKNESS AND THE DAWN.

"**A** WAY with you, child, or you will be too late. Don't forget your basket; and here, wrap this shawl close around you, for it is a fearful night outside."

The speaker, raising himself on his straw pallet, peered for a moment through the uncurtained window. "Come, Nannie," he continued, "it is growing worse each moment. You'd better start immediately."

"Let me call Mrs. Dentmore to stay with you while I am gone, father," replied the child he had addressed, pausing a moment in her preparations for departure—"you look so very sick to-night!"

"Nonsense!" said the invalid, in a voice sharp with weakness. "Don't you know that old woman drives me nearly mad with her droning tongue? Do hurry, Nan! If you're late again, you'll be sure to lose your engagement, and then—"

"There, there, I'm gone," said the child; and pausing a moment beside the invalid, she passed her hands gently over his suffering forehead; then pressing a light kiss on the lips quivering with impatience, she ran hastily from the room and down the steps.

On the first floor she stopped a moment to knock at a door on the left of the landing. It was opened by a comfortable, fleshy old woman, in a neat cotton gown.

"Mrs. Dentmore, father seems worse to-night. Will you go up and listen once or twice outside the door? I feel so very anxious about him."

Mrs. Dentmore's tympanum must have been situated somewhere in her toes, and Nannie's voice must have traveled on an investigating tour to the remotest parts of her ample person before it made its way to the brain, for it was full a minute before she replied. The child in the meanwhile was fairly dancing with impatience.

"Eh—your father's worse? Well—you don't say so! I told Susan to-day, as I was just finishin' my bit of dinner—you know, vittles is mighty dear this winter; so I eat 'em slow and chew 'em up fine, to get my money's worth out of 'em—well, as I was tellin' Susan—"

"Please, Mrs. Dentmore, I'm in such a hurry! Can you go up and look to father?"

"Well—yes, I—" The rest of the sentence was delivered to the rickety old staircase, for Nannie was already in the street. A gust of wind swept up the steps as she flung the door to behind her, putting out the light that Mrs. Dentmore held in her hand, and sending the old lady back into her room at the top of her speed—that is to say, at the rate of about a mile in two hours.

After several vain attempts she succeeded at last in stumbling into a chair, where she sat staring about the room for some time in a dazed way. At last the fact that her candle was out and needed relighting dimly dawned upon her. After some ten minutes of reflection on this subject she rose and began looking for the matches.

By this time Nannie was far down the street. A heavy snow was falling, and the rising wind blew the sharp crystals into her face; but the little figure breasted the storm bravely. At the corner she darted into a small fruit store. A round-faced German stood behind the counter.

"Mr. Schmidt, have you any nice grapes?" she asked, out of breath. "I want to give a bunch to father to-morrow for a Christmas gift, you know."

Mr. Schmidt nodded knowingly, and, without a word, disappeared behind the counter. He soon emerged again, however, holding a basket in his hand. It was filled to the brim with oranges, grapes, and luscious pears. Nannie stared in wonderment.

"You must not have no fear of him; he vill not bite you," said Mr. Schmidt, with a fat chuckle. "It is a leetle Christmas present for you and the father. Kriss Kringle has given him to me for you; and in de bottom of it is anoder kind of pair, what my woman she has knitted for you. You must not make no mistake and eat dem, for dey—dey schmecken nicht gut, you understand; dey do not grow onto de trees like dese oders. Ha, ha, ha!" Mr. Schmidt laughed so uproariously at his own irresistible wit that he immediately went into a prolonged choke.

"Oh, Mr. Schmidt, how can I ever thank you?"

"Don't—don't you dank me," gasped Mr. Schmidt. "I have told you it was Kriss Kringle and my old frau have done dis whole ding. Dey whisper and dey nod de heads, and dey say, 'Hush, hush!' Dey vill not let me say noting at all. I could not speak one word, not for one whole week."

This last happy hit was too much for Mr. Schmidt, and he went off into a series of snorts which would have been truly terrifying to any one not acquainted with his powers of non-suffocation.

Before he could recover his voice, Nannie, seizing one of his fat red hands, imprinted a kiss on it.

"A merry, merry Christmas to you, and your wife, and all the little ones!" With this she ran hastily from the shop, disappearing in the darkness outside.

Mr. Schmidt fixed an astonished gaze upon the hand which had been caressed. Then, with an approving nod toward it, he said, "Dat vas gut, vasn't it, old fellow? I likes dat; it makes me dink of de Vaterland." He sank back in his chair with a complacent chuckle, and continued for some time to smile approvingly at the chubby member which rested on his knee.

Meanwhile Nannie had turned the corner. The wind blew less violently from that direction, and she ran down the street at full speed to make up for lost time. At the end of the fifth square she darted into an alley, and entered the rear of a large building.

She paused a moment, as the door closed behind her, to regain her breath; then turning to the left, she wound her way rapidly through a labyrinth of passages, emerging presently in a large, bare room. A number of fairy-like creatures were floating about in various stages of the toilet. One of them, a lovely little being enveloped in masses of blonde hair, shouted to her, as she entered,

"You'll catch it, Miss Nannie Llewellyn: the curtain will go up in ten minutes."

Nannie, without making any reply, hastily retired into a corner, where she deposited the basket of fruit, carefully covering it with her shawl. The blonde fairy followed her, and furtively watched the operation.

Nannie caught her gaze as she turned.

"Sally, please don't look at me," she said, beseechingly. "Please let me alone, just to-night; I am in such a hurry, and you know I never can dress fast when you're all staring at me so."

Sally replied by shouting out to a crowd of idlers who had finished their toilets, "Come here, girls! Miss Proudie Llewellyn wants you to make a screen around her while she dresses herself."

A bevy of silver-winged angels immediately surrounded the victim, a malicious giggle on their pretty faces.

Nannie's cheeks flamed crimson as she dropped the cotton dress from her shoulders, and took off one article of clothing after another, all of them very coarse and very much patched. In vain she sought to escape by retreating further into her corner; in vain she tried to shut her ears against the whispered criticisms on her scanty wardrobe. Her tormentors only pressed the closer about her, and the whispers grew into open derision.

Nannie's self-control was giving way; her hands were trembling so she could scarcely unfasten her clothes. At last she could restrain herself no longer.

"Girls, it's wrong, it's mean, it's wicked of you!" she burst forth, pausing a moment

to steady her voice. Then, in a quieter tone, "It's almost time for the curtain, and I am not half ready. Don't you see that I can't dress while you are all looking at me? Please, please let me alone!"

"Who's hindering you, I should like to know?" said Sally, with a loud laugh. "We'll help her dress, if that's all she wants; won't we, girls?"—catching with a sudden rude gesture at the garment Nannie was taking off.

"For shame, Sally Smith!" cried a girl on the outskirts who had been silently observing the scene. "A little fun is well enough, but this won't do. I, for one, mean to let her alone after this; she's never done any of us any harm. Come, girls, let's leave her in peace." The speaker led the way, and the greater part of the group followed her example; but Sally and her set remained.

At this moment the principal danseuse, Mademoiselle Eulalie (*alias* Kate O'Brien), appeared from an adjoining dressing-room.

"What are you imps up to? Will you leave that child alone!" she said, and, catching Sally by the shoulders, she sent her whirling into the centre of the room. The rest gave way without further warning.

"Miss Neal is sick," she continued, keenly surveying a group which began to cluster about her, "and I've come to choose some one in her place."

"Take me! take me!" they all shouted in unison.

Miss O'Brien swept them aside with an imperious wave of the hand; then, suddenly turning, she confronted Nannie.

"How old are you?" she demanded, abruptly.

"Eleven."

"Humph! small for your age. Father and mother living?"

"Mother died when I was three years old."

"Any brothers or sisters?"

"No—that is—I had a sister once."

"Is she dead too?"

"I—I don't know."

Sally here gave a malicious giggle.

"Hush, you imp!" said Miss O'Brien, in a tone which terrified even Sally. "Go on," turning to Nannie; "tell me about your father; is—is he dead too?"

Nannie shuddered. "No—oh no; he's alive. He's very sick. If I could only earn more money!—but I mustn't talk. The curtain will ring up in a minute and—" Nannie tugged nervously at the flimsy dress she was adjusting, and tore it from top to bottom.

"Oh, what have I done!" she said, in a tone of despair.

"Just done enough to get your walking papers—that's what you've done, missy," said Sally, with a short laugh.

At this moment the call-boy made his ap-

pearance, and the room was cleared immediately. Nannie, fastening her clothes as she went, was preparing to follow the rest, when she was called back by Miss O'Brien.

Her heart sank within her as she stood, trembling, before the keen blue eyes of the danseuse.

"Could you take Miss Neal's place?" said Miss O'Brien, gazing at her with a strange stare.

"I—I could try," said Nannie, with flushing cheeks. "I have danced it at home."

"Very good; we can try it once, as we do not go on until the second act. Now, then, begin."

Nannie, shivering with fear and excitement, still performed her part creditably. Her father, who had followed the stage as a profession until his health gave way, had taken great pains to train her as a dancer. From her earliest childhood she had gone through several hours of practice daily.

"You'll do, my—Miss Nannie," said Miss O'Brien, with a sudden softening of voice and manner, which quite startled the child. Then, hastily turning away, "Come, you must dress again. Miss Neal's clothes will just fit you."

Twenty minutes later Nannie emerged from Miss O'Brien's dressing-room and took her place at the wings, waiting for the curtain to rise on the second act. Sally, looking fairly green with envy, stood beside her, furtively examining her dress.

"You're a perfect fright," she whispered. "You—" The intended speech was cut short by the electric burst of trumpets which heralded the rising of the curtain and entrée of the corps. The joyous sound seemed to tingle to the very ends of Nannie's toes. The little shrinking figure sprang erect; the grave, roughly chiseled features gleamed with delight; and the dark eyes are growing black with excitement. With an impatient gesture she tosses the mass of hair from her flushed face, and stretches eagerly forward. She is gathering all her energies for the coming effort. She feels that this night may decide her father's fate. His wan features, growing feebler day by day, float before her, shutting away the gorgeous scene.

A moment more, and she must go on: a moment more, and she must front—what? A thousand cold, searching faces.

With a shudder she shrinks back; an overwhelming panic is seizing her; the lights sway before her; fear is numbing her limbs. With a passionate murmur of appeal, she raises her eyes: "Mother, mother, help me!" and the next instant she leaps, with one powerful spring, almost to the centre of the stage.

For a moment she stands lightly poised; then, as the music lulls into a lovely rhythmic measure, her supple form sways into the soft curves. The numbing fear is gone; the

heavy heart has grown light as a feather; all her little world of suffering is merged, for the time, in an exultant sense of her own physical power: her muscular, mobile body is a delight to her. Suddenly, as the music breaks into a startled thrill, she drops upon one knee, in an eager, listening attitude, the upturned, smiling face glancing shyly over one shoulder.

Some one is stealing up behind her. It is a gallant youth, with flowing yellow locks and effeminate pink cheeks. He is close upon her, he is stealing one arm about her, he is pressing—no, she has sprung from him; her black eyes are gazing angrily through the veil of hair she has drawn about her. He is approaching again; with one agile spring she eludes his grasp; he follows in pursuit. Faster and faster comes the music, the shrill, searching crescendo of the violins seeming to urge her on. Lightly she leaps over the mimic banks and past the gleaming caves, the youth in full pursuit. One moment she is almost within his grasp, the next she is poised far above him on some overhanging rock. Every attitude, every motion is full of tantalizing grace. The stage is growing too small for them; in and out of the wings he chases her. Once he has forced her almost on to the foot-lights. Instinctively he stoops to catch her; but, with a laugh of triumph, she bounds over the outstretched arms, and while he is recovering his equilibrium she drops for a moment into a lovely swinging step with such nonchalant ease one can scarcely imagine it to be the muscular hoyden of the moment before.

The knight is close upon her again; a breathless whisper reaches her ear, "For mercy's sake let me catch you! I'm fairly worn out."

"All right," said Nannie, without looking around. The next instant the flushed and panting youth was prostrate before her, rapturously kissing the rosette on her slipper. At last he ventures to raise his head and gaze at his long-dreamed-of prize. With a cry he starts to his feet—for a hideous demon is glaring at him, and far above, floating upon a rosy cloud, soars his idol.

The curtain descended upon a burst of applause. Kate, in her knightly toggery, led Nannie before it. The shouts were renewed, and the child made a shrinking little courtesy as they withdrew.

The rest of the evening passed in a sort of maze. The manager had shaken hands with her, and spoken very kindly, while Sally and the rest of the ballet-girls looked as if they could scarcely believe their senses.

At last it was all over; she returned to the dressing-room to lay off her finery, and descend to the level of every-day life. She was just fastening the last button, when Miss O'Brien entered in street costume.

"Where do you live?" she asked, pausing a moment beside Nannie.

"Seventy-two East Street."

"That is on my way home; I'll take you with me. Here is your shawl. Bundle yourself up; it's freezing cold outside. Why, what's the matter?"

Nannie was gazing at an empty basket in the corner.

"Lost any thing?" inquired Miss O'Brien.

"Yes, oh yes! Mr. Schmidt gave me that basket full of fruit for father, and it's—it's all gone!" She choked down her sobs.

"Those imps again!" muttered the other. "After this you're always to dress in my room. Do you hear? And, by-the-way, here here are some bouquets that probably belong to you—three regular beauties; take them to your father. They'll do better than nothing!"

"Oh, Miss O'Brien! I—" The tears, which were very near the surface to-night, were rising in Nannie's eyes.

"There, there! don't make a fuss," said the danseuse, hastily. "Come, we shall be left in the dark."

As they were hurrying down the passage Miss O'Brien, suddenly turning, grasped Nannie by the shoulders, and, without uttering a sound, gazed into her face long and earnestly.

"Child," she burst forth at last, in a low, hurried voice—"child, it's Christmas to-morrow, and I shall be alone all day. There's not a body in the world belonging to me. Do you think your father would mind my coming to see you? You—you remind me so of—of my little sister that I lost. Please let me come!"

Nannie looked in speechless astonishment at the face bent close to hers. This haughty young creature, who kept her most devoted admirers at arms-length—this unapproachable being, whom even Sally feared—was looking at her with a beseeching, almost tearful gaze. Nannie rubbed her eyes, wondering if she was dreaming.

"I didn't mean to say any thing about it," continued Miss O'Brien, as Nannie still remained dumb, "but your ugly, dear little face, with that faded old shawl tucked around it, was too much for me." Then, after a pause, "If you don't want me, just say so."

"Want you! oh yes; but—" Nannie stopped in distress.

"Speak out, child; don't you be afraid of me too; my bark's worse than my bite."

"I think father would like to see you if—if you wouldn't talk quite so loud. You know he is very, very sick."

"I'll promise to adopt the manners and customs of a week-old lamb and the voice of a cooing dove, if you'll only let me in. And you know I've a regular Irish appetite; so, if you don't mind, I'll bring my *parraties*

and buttermilk with me, and we'll have a regular jolly good time. I'll bring— Why, what's the matter, child? You look as sober as an owl."

"I don't think father would exactly like—" Nannie began.

"Taking any thing from me? that's what you mean. If you only knew how my money burns in my pocket, with nobody to help me spend it, you wouldn't hinder me. You may just rest easy; for it's a good action you'll be doing me. Oh, if I could only get away from the simpering fools and the crowd and the tinsel—just for one day! You make me think so of the old times, with your great eyes and your modest, shrinking ways; you look such a little home body, you remind me of twilights round the fire and singing tea-kettles and baskets full of stockings to darn, and voices— There!"—stopping suddenly, and clearing her throat with a violent cough—"there! the lights are all out. John's outside swearing, the horses are freezing, and I'm making a fool of myself; so come along."

A few moments later they were rolling along in Miss O'Brien's carriage. Nannie, overcome with gratitude, was trying to stammer out a few words of thanks. The other effectually stopped her by putting her hand over her mouth: "Not a word about that, if you please. You're just to lean back in the corner—so! and don't you utter a sound all the way home. You're fairly worn out, child. You'd be off in hysterics at a minute's notice!"

Nannie obeyed with a sigh of relief. Miss O'Brien gathered her quivering hand in a warm, firm grasp, and the child clutched at her as if she were drowning.

A sudden warmth was springing up in her heart toward this impulsive, strong-voiced woman, rapidly melting away all her fear. Never before had she known the luxury of being carried along by a will stronger than her own. From her earliest childhood she had had the sole charge of her father—a sensitive, despondent, weak-willed man, who had constantly drawn upon her vitality. At the age of nine, the old man's health having given way entirely, she had gone upon the stage; and from that time until the present the care and support of the invalid had rested on her young shoulders.

She had scarcely recognized what a strain it was until to-night; until she had felt the clasp of that even-pulsed hand, and yielded to the restful authority of that voice and manner. Even the touch of roughness and loudness there was about her seemed a relief after the strained quiet of the sick-room.

"Here we are," said Miss O'Brien, as the carriage stopped. "I'll be with you bright and early to-morrow, and if your father gets tired of me, I'll be off immediately. Good-night!"

Before Nannie had time to reply she was lifted to the sidewalk, and the carriage had turned the next corner.

She crept noiselessly up stairs, stopping a moment on Mrs. Dentmore's landing. All was dark and quiet. She mounted to the attic and softly opened the door; the candle was out, and the fire burned low. She listened a moment before entering, but her father did not stir. "I am glad he is sleeping so soundly," she murmured; "he will be so much better to-morrow if he has a good night." Undressing hastily, she crawled to her pallet, and her tired brain was soon drifting away into dream-land.

Swiftly the dark hours passed away, and gray dawn, with its burden of awakening thought, came creeping back. Slowly it crawled across the silent room toward the sleepers, stealing softly under Nannie's black lashes. With a sigh she turned on her mattress and half opened her eyes, still glazed with slumber. They rested for a moment on the bouquets, which she had placed in range with her pillow. With a bound she sprang toward them, startling the sleepiness from her face in an instant. The events of last night came rushing back upon her in an overwhelming flood, and she fairly gasped for breath as she remembered what had happened. It had all seemed natural enough under the glare of gas-light, but now, with the cold, common-sense chill of day upon her, it came over her almost as a myth.

She turned eagerly toward her father, longing to tell him the news; but the face was turned from her, and he seemed sleeping soundly. She felt too restless to lie down again; so, gathering up her clothes, which in her hurry last night had been dropped in a heap on the floor, she went into an adjoining closet, which served as dressing-room. She soon emerged again, her cheeks glowing from a brisk morning bath, and proceeded to make the fire and put on the kettle for breakfast. Then, creeping softly to her father's bedside, she arranged the bouquets on the floor close by him, so that his eye might fall upon them as soon as he awoke. In doing so she inadvertently touched his hand, which lay outside the covering. She drew back with a start: it was icy cold.

"Poor father!" she murmured, "you are almost frozen. Never mind; when our ship comes in I'll buy you the very thickest, woolliest blankets I can find; but till they come my shabby ones will have to do."

Drawing the covering from her own bed, she dropped cautiously upon one knee, and, stretching carefully over him, laid it upon his uncovered shoulders.

Suddenly she drew back, intently listening with parted lips. Her position was horribly like the graceful poise of last night; but no sweet, arch smile was there. Her

face is growing stiff and white with horror. For a moment she covers her ears with her hands, then listens again. She stops breathing, and stoops over him. Not the shadow of a sound to break the awful stillness. With fixed and staring eyes she leans farther forward; but she can not see the face; it is pressed into the pillow, and partially covered with a mass of iron-gray hair.

The Dread seems driving her on. Shudderingly she draws closer, and with one terrible effort clasps his head between her hands, turning it toward the light.

Slowly the long, lean fingers of the dawn crawl across the glazed eyeballs, but they can never again reach the tired brain. It is shrouded forever.

Nannie sank crouching beside him, her stiffening fingers still clasping his head, her gaze still riveted on the ghastly, motionless face. The haunting eyes seemed beckoning her on. Slowly she bent toward them until her cheek touched the icy forehead; then, with one ringing scream of terror, she sprang to her feet, reeled toward the window, and, after vainly trying to raise the sash, dashed her hands through the panes.

The streets were still deserted. A heavy snow had been falling during the night, shrouding the earth in a cold, uniform whiteness. Miles of flat roofing stretched away in the dim light far into the distance.

The cry of fear died upon Nannie's lips as she gazed out upon the still morning. An overwhelming pain was coming upon her—a pain more searching, more terrible, than physical fear. In all this great city, in all this great, cold, white world, there was not one living soul to whom she could turn for help. In this, her great need, she was utterly alone.

Years afterward, when she had become a contented wife and mother, loving and beloved, Nannie could not look out upon a snowy winter dawn without a shuddering thought of that morning which had brought her such sudden isolation.

And now, the blow still fresh upon her, she was faint and dizzy with the sickening pain. She had come face to face with the Inevitable, and her narrow child's heart rebelled with passionate bitterness.

Would this dreary morning stretch out for ever and ever? Would she always, her whole life long, feel strange and sick and cold, just as she did now? Could there never be any more sunshine, any more cheery words, for her in this world? Would it always be like this—always so awfully, horribly silent?

She sank to the floor with a helpless moan, the snow drifting down upon her as she lay. She looked at her hands, scratched and bleeding from the broken pane, and felt a feeble exultation in her heart. She should not mind touching her father now, she thought,

for she would soon, perhaps, be as stiff and cold and terrible as he was. She looked toward the corpse: the wide-open eyes were still ghastly to look upon, but now she noticed that a gentle smile was on the parted lips. With a wild gesture Nannie struggled to her feet, flinging her arms toward him; the next moment she fell heavily to the floor.

Gradually the light grew stronger, peering curiously into the silent room. Nearer and nearer came the stirring bustle of the great holiday. The Christmas chimes pealed merrily across the white roofs. The sounds of the great city grew loud and hoarse, swelling at last into one continuous roar. Even the quiet respectability of East Street was invaded. The sun rose in unclouded glory, his bright beams dancing over the glittering snow, until palace and hovel basked in the democratic warmth. Quickly they found their way to our attic, beaming through the broken window in a great smiling stream of light. They were used to a cordial welcome here, for this gush of morning sunshine was one of Nannie's pleasures; but to-day it came and went unheeded.

Hour upon hour passed, and still Nannie did not stir. Twice Mrs. Dentmore had clambered up the staircase and knocked at Mr. Llewellyn's door without receiving an answer.

"Never knew the child to sleep so before!" she muttered, as she slowly wended her way down again. "The poor thing's just worn out with her watchin' and her worryin', and no wonder; for Mr. Llewellyn is that contrary and that obstinate he'd find fault with the Angel Gabriel himself, and say it made him nervous to hear him tootin' on his trumpet. It's my opinion it's all humbug about them nerves of his'n. I ain't got no nerves, and never did have, thank the Lord!"

Mrs. Dentmore's reflections were here brought to a close by a resounding knock. She hastened down the remaining flight of stairs, and opened the door to the visitor.

A handsomely dressed lady stood on the steps, and behind her came a servant carrying a large hamper.

"Miss Llewellyn in?" asked the intruder.

Mrs. Dentmore eyed her with a gaping stare.

"Is Miss Nannie Llewellyn at home?" repeated the visitor, in a louder tone. "My name's O'Brien. David, bring the hamper in, and tell John to wait with the carriage. On which floor does she live?" continued the lady, turning to Mrs. Dentmore.

That venerable dame still stared in speechless amazement. Miss O'Brien approached her lips to her ear, and reiterated the question at the top of her voice.

"Lord 'a mercy! why—why, she's asleep," ejaculated Mrs. Dentmore, retreating a few steps.

"Asleep? nonsense! On which floor is she?"

"In the attic."

"Here, David, bring the provisions along. I'll see for myself."

Miss O'Brien bounded up the steps, leaving Mrs. Dentmore breathlessly staring after her. In a few moments she again made her appearance.

"My good woman," she said, hastily, "there's something wrong up there; we must force the lock."

"Force—the—lock!"

"Yes; it will be easy enough; the door is very rickety; David can easily open it. I should like you to come up, in case there is any assistance needed." And thereupon she unceremoniously seized Mrs. Dentmore by the arm, and trotted her rapidly up the steps in spite of the old lady's gasping expostulations.

The door was soon opened, and Miss O'Brien, after brief hesitation, entered the room, followed by Mrs. Dentmore and David.

For a moment the three stood transfixed at the sight which met their eyes: the next instant Miss O'Brien was kneeling beside Nannie. Raising her in her arms, she laid her ear to her heart, listening intently for a moment. "Nannie! Nannie! my baby! my precious, precious darling!" she murmured over and over again, passionately pressing the pallid face to her warm cheek. A faint sigh parted Nannie's lips.

"Don't take on so, miss; she's comin' to," said Mrs. Dentmore, advancing with a pitcher of water in her hand.

"Stand back; she mustn't be brought to her senses here," said Miss O'Brien, looking, with a shudder, toward the lifeless form on the bed. "David, tell John to go for a doctor at once; the gentleman may only have fainted, and this child must be attended to immediately. Mrs.—what is the name?—Dentmore?—Mrs. Dentmore, you must stay with Mr. Llewellyn while I carry Nannie down to your room."

"Oh, ma'am! oh, miss!" said Mrs. Dentmore, imploringly, "it ain't no use; he's dead; I know he is; he's been murdered; and me that's always been so respectable, and lived in this house for more'n forty years without so much as a cat bein' killed in it, I'm to be disgraced like this. Oh, miss, don't leave me with a dead corpse; and me that was a-scoldin' and grumblin' and talkin' about the Angel Gabriel, and him a dead man all the time. He'll rise up ag'in me in the day of judgment; I know he will. Oh, Lord 'a mercy! Lord 'a mercy on my soul!"

Mrs. Dentmore shambled down the steps after Miss O'Brien, casting terrified glances over her shoulder as she went.

Shortly afterward the physician arrived. He said Mr. Llewellyn had been dead some time—had probably died very suddenly in

the earlier part of the night. He left some medicine for Nannie, who still lay in a state of semi-consciousness, and departed on his way.

Kate O'Brien made all the arrangements for the proper care of the body, leaving her man David in charge. She then returned to Mrs. Dentmore's room, took the unresisting Nannie in her arms, carried her to the carriage, and ordered John to drive home as fast as possible.

After a ten-minutes' ride the panting horses drew up before a small, handsome dwelling. Miss O'Brien, still carrying her burden, mounted the steps, unlocked the door, and without a word to the open-mouthed maid whom she met in the hall, proceeded immediately to her own bed-chamber.

Nannie was still in a stupor. Kate undressed her and put her to bed; then, shutting out all light and noise, she sat holding the quivering hand until the child fell into a profound sleep, which lasted many hours.

All night she watched by her, but toward morning she herself fell into a light slumber. On awaking she found that Nannie had risen, and was standing before her, dressed for the street.

"Why, child," she exclaimed, "where are you going? What possessed you to get up?"

"I could not lie still any longer," said Nannie. "I must go back to—to East Street, to father."

The lady looked anxiously into her face. It was quite calm, but there was a heaviness about the eyes, a patient sadness about the childish mouth, more pathetic than any demonstrative grief.

"You must not go"—this in her most decisive voice. "Every thing has been done that can be done; the doctor says any excitement might be fatal to you. Besides, I want you to be my little housekeeper. I'm obliged to go out for an hour or two this morning. Trust me"—this in reply to an imploring look from Nannie. "Now, then, to breakfast, and after that I must be off. I always do up my own room for exercise, but I'll leave the job for you to-day."

"Nothing like good hard work to cure an aching heart," thought Kate O'Brien, as she handed Nannie a broom and duster before departing on her errand.

A few hours later she returned, looking wearied and pale. "Nannie," she said, drawing the child down beside her on the sofa (then, to herself, "I may as well have the thing over at once")—"Nannie, in the first place, I have just come from your father's funeral."

Nannie started from her seat; then, dropping down again, she hid her face in the cushions, and sobbed convulsively. Miss O'Brien let her cry for some time without interruption. Then she said, softly, laying

her hand on Nannie's throbbing forehead, "Child, are you angry with me?"

"Angry! Oh no, no! but— Oh, my poor father! I was all he had in the world. It was cruel, it was wicked of me to leave him all alone with strangers."

"I was there, Nannie."

"Yes, and you have been very good to me; but you were a stranger to him."

"No, my child; I knew your father many years ago. It is a sad story. I must—I— Oh, Nannie, Nannie!"

Kate O'Brien had fairly broken down. Her powerful frame quivered and struggled with the long-hushed grief. Setting her teeth hard together, she sprang from the sofa, and walked, with a fierce stride, from one end of the room to the other.

"Oh, don't, don't cry so!" said Nannie, startled from her own pain by the vehement sorrow of her companion. "Let me call somebody. What shall I do?" In an instant Kate was beside her.

"Don't be frightened," she said, gently stroking Nannie's hair. "Look at me; I am quiet now."

The child stared with a startled glance into the white face. The haughtily arched mouth was drooping with humiliation and misery, but the eyes had their usual steadfast look.

"I don't want my little girl to be afraid of me," she said, with a quivering smile, "until she has heard all my story. Then, perhaps, she may fear and hate me both. Nannie, let me hold your hand, and when you draw it away I shall know then that— There, don't be frightened; I'm going to begin."

"Twenty-seven years ago my father married my mother. I was born in the second year of the marriage. My father was wild, obstinate, willful, and an Irishman. I have inherited from him all these charming qualities. My mother was an angel from heaven. My father was killed, while out hunting, when I was two years old. Ten years afterward my mother married again, and moved to this country. I hated my step-father, and he hated me. When I was about fourteen a baby sister came. My whole pent-up affection was poured out upon this child. She had mother's sweet, mild disposition. Every body loved her; my step-father actually worshipped her. One day, when the baby was about fifteen months old, I had made myself even more disagreeable than usual. Every body was out of patience with me. The baby said I was an 'udly dirl.' Father threatened to whip me, and mother's wistful eyes gazed at me with a look that cut to the very heart. I felt as if every body hated me. I knew that the wild, restless devil in me was growing bigger day by day, and felt an irresistible desire to go to some place where all the people were as wicked as I was, and where nobody would ever tell me that I

was 'almost a young lady;' and so—I ran away.

"The greater part of my time, for the first few months, was spent in the pleasant little occupations of starving and freezing. I traveled about for some time with wandering musicians; then I joined a strolling company, under the name of O'Brien, which I have kept ever since."

"After a two-years' absence I made my way back home. I was thoroughly tired of my hard, rough life, and had determined to return to mother and amend my ways."

"I sought out our old lodgings. The house was closed and to let. I asked for the landlord, and was ushered into a small room at the left. A few moments later he made his appearance. He was a small, nervous man, rejoicing in the name of Twitter, who was constantly rubbing his hands. I perceived, as he advanced with a series of twistings supposed to be bows, that he did not recognize me."

"'Good-morning miss modern improvements miss well-ventilated miss very respectable miss.' This speech was delivered without stopping to take breath."

"'I beg your pardon, Sir; but I am neither respectable, well-ventilated, nor have I the modern improvements.'"

"'Eh?' ejaculated the little man, nearly rubbing the skin off his hands."

"'I have not come to look at the house, Mr. Twitter;' and thereupon that worthy immediately left off rubbing his hands. 'Oh!' he said, drawing his head down behind his capacious collar, like an overgrown turtle."

"'I have come to make inquiries concerning a family who lived here about two years since. I am a distant relative of theirs.'"

"Mr. Twitter popped his head up, shook it mournfully, and again retired into his shell."

"'Well?' I said, impatiently."

"'Very sad, very sad story indeed, miss; highly improper for ears as young as yours.'"

"'Never mind my ears.'"

"Mr. Twitter, who in his heart was very fond of a little gossip, rubbed his hands and settled more comfortably in his chair, preparatory to a long story."

"'Very sad family misfortune, miss; eldest daughter, only fifteen, miss, went to the bad entirely.'"

"'It's a lie!'"

"'Eh?' gasped Mr. Twitter, starting from his seat."

"'Go on,' I said, looking him straight in the face. 'But if it's all the same to you, I'd like you to stick to the truth. It's hard enough in this world to keep a clean soul in one's body; but it's ten thousand times harder to keep a clean name. This girl has been fighting a hard fight for the last two years. She has been resisting sin with all

the strength that is in her, and here you, with one breath of your puny body, are doing your best to brand her forever. You—you dried and shriveled mummy—you pretend to judge a woman who feels more in one moment than you do in ten years! I know her, and I tell you her wild Irish blood leaps in her veins as if it would burst them. But God—may His name be praised!—has given her strength to pass safely through the fiery furnace. And if you ever dare to whisper another word against her, I'll—Now, then, go on.'

"All that was to be seen of Mr. Twitter's cranium was a modicum of stray hairs standing on end with fright. He presently emerged, however, and after a few nervous gasps and much rubbing of hands he proceeded with his story.

"A thorough but useless search was made for the young lady; and her mother, who was a very delicate woman, took her daughter's disgrace—' Mr. Twitter jumped from his chair and rapidly made his way toward the door.

"Come back, Mr. Twitter. You meant to say her supposed disgrace.'

"Yes,' gasped Mr. Twitter. 'Her dis—her sup— Oh dear! oh dear!'

"She took it hard, did she?'

"Yes, yes; very hard. She died about a year ago; and they say it was the—the supposed disgrace of her daughter that killed her. Eh? what's the matter?'

"Nothing. Go on.'

"Mr. Twitter rose, and stood in the open door-way as he hastily finished the story. 'The father, with the remaining daughter, went away about a month ago, and the last words he uttered as he left the house were a terrible curse on the outcast. Good-day, miss.' The last words were scarcely out of his mouth when Mr. Twitter, casting terrified glances behind him, was speeding rapidly down the passage."

Miss O'Brien paused a moment. Her face was very white, and her voice had a hard, metallic sound as she proceeded, hurriedly: "I'm a coward! I am trying to put it off; but it must come. Child, you know who I am. Nannie, Nannie, I am your sister, Kate O'Connell. I killed our mother, and darkened your father's life. I was cursed by the man whom I followed to the grave to-day. His face haunts me; it will haunt me as long as I live." Then her head dropped heavily on her hands, and she remained silent for a few moments. "Child," she continued, in a low voice, "I have known you were my sister for two or three months. This winter has been one long nightmare to me. Nannie, I have sinned; but, great God! how I have suffered for it! It seemed sometimes as if my heart must break with remorse when I looked at your quiet, patient face, so

like mother's. Oh, how I have longed to gather you away in my arms and tell you every thing! but I saw that you shrank from me, and I could not bend my hard pride to ask you and your father to take me back. Christmas-eve, when I heard you were in distress, I determined to go to your father and ask his forgiveness. But the good God has willed it otherwise. And now—Nannie?'

The child sat stunned; her hands had fallen limp and powerless by her side.

"Oh, Nannie!" her sister continued, almost in a whisper, "my life is so empty. I have tried to fill it with glitter and pomp. I have tried to stifle my conscience, but I can not. Nannie, you won't shut me out entirely? You'll let me love you? I know I'm a bitter, world-worn woman, and you were always good from the very beginning; but my love can't hurt you." She paused, gazing in breathless waiting at Nannie's motionless face. She leaned forward; but there was not the breath of a whisper upon the pale, close-shut lips. Slowly the minutes passed away, until the silence grew intense. Kate's strong frame was swaying and bending as if shaken by a fierce wind; her overstrained fortitude was giving way; with one great groan of anguish she sank cowering on the floor.

Nannie rose to her feet, and, raising her hands to heaven, uttered the one simple prayer of her life—"Mother, help me!" A moment she stood, her upturned face rapt and motionless; the next, she was kneeling by the prostrate form, sobbing and laughing all in a breath.

"She forgives you—mother forgives you!" Passionately she drew her sister's face close to hers. "Oh, look, look up! Can't you feel her? She is here; she is blessing you! Oh, Kate! oh, my sister!"

With an unsteady motion, painful to see in so powerful a creature, Kate rose to her feet, and lifted her face toward heaven.

"It is all shut away from me; I can see nothing," she said, in a slow, uncertain voice. "Oh, Nannie! tell me about it; help me away from myself. Could you pray for me, Nannie?'

And so this world-tossed waif crouched before the Great Unseen, groping her way in fear and trembling through the thick darkness. Softly the simple words of the inspired child fell upon her ears, telling of God-sent angels, patient, full of loving-kindness; telling of a world so close, so full of a wise tenderness, that we need never be afraid. Gradually, as she listened, the strained, quivering face fell into repose, and the heart which had tried in vain to hush its remorseful beatings through worldly excitement and worldly success grew still at last in that peace won by the poor in spirit, whose heritage is the kingdom of heaven.

THE ARITHMETIC OF GOD.

PROBABLY there has never been a period since man began when the feeling did not prevail that new times were coming and old things were passing away. Old Eden undoubtedly had its sensations and surprises with each new aspect of nature or season of the year; and when Eden was lost, a new leaf was turned over in history, and expectations, hopes, fears, catastrophes, and deliverances came that have not been described to us in the newspapers of those days. What would we give for some fresh, graphic contemporary account of the great crises in the fortunes of our race before the historic period opened, and when men were able to tell their own story! Undoubtedly they had some way of telling their emotions before books began to be, or newspapers were dreamed of. It is startling for us now to read the inscriptions scrawled upon the walls of Pompeii just before that city was buried under the ashes of Vesuvius, and it is evident that the citizens had other excitements and agitations to think of besides those that came from the fitful fevers, groans, and vomitings of the burning mountain. Yet we moderns may be excused for thinking that we have fallen upon remarkably new times, and that things have of late been going on about us as never before on earth. What is the matter with us and the world, it is not easy to say; but it is clear that something is the matter, and that certain mighty, persistent, and irresistible forces are shaping civilization anew.

It is not easy to prove that any absolutely new ideas are at work in our time, for there is no modern thinker or reformer whose essential ideas have not been virtually held a thousand years ago, and there is no dream of the new times that can not be matched among the dreams of the old classic sages and poets, or the visions of the old Christian saints. God himself is no modern discovery, nor is his Spirit any recent invention, nor his Word any new-light manifestation. We moderns must empty ourselves of a vast deal of conceit before we can estimate ourselves and our doings wisely; and I hope that this number of our Magazine will not be burned by a mob of agitators, or put on the Index Expurgatorius of the Pope of Rome, or of that more formidable pope who wears the crown of infallible public opinion, because of the suggestion that what we call modern times comes mainly from our new tools and new tongues. For some four hundred years we have been going on at a wonderful rate, without always knowing upon what wheels we are rolling, and with no infrequent temptation, in the most garrulous and fidgety of the riders, to think that their prattle and their legs keep the train in motion. About the beginning of the sixteenth century the stir-

ring events of the previous years began to tell upon the nations. The mariner's compass in the hands of Columbus and Da Gama had opened America and India to Christendom, and given new material and motive to industry and enterprise, while the printing-press had begun to take the whole people into the secret of thinkers, and tell them what philosophers had written and apostles had preached. Within about a hundred years the movement then started has been showing signs of its great consummation, and in the century that dates from the birth of our nation, in 1776, the new tools and tongues have been doing and recording their wonderful work, and it is easier to say what powers are at work for us than to predict exactly what results are coming from their operation. Perhaps it is better for us, however, to count the centuries as they stand, and to call the sixteenth, seventeenth, and eighteenth centuries as three acts of the great modern drama, and to study this nineteenth century as the fourth act, which is bringing the crisis so near. It began with the lament for Washington and the jubilee for Napoleon the First, and its continuous years are counting the numbers of these two men of destiny.

In this nineteenth century two new forces have been uniting and applying all the tools known to man, and steam has been the breath and electricity the nerve of the new leviathan of mechanism that is now threatening all the old giants of our earth. These two are now our great carriers, the one carrying bulk and the other carrying intelligence, and in numberless ways bringing together all human powers. They are accompanied with two languages that are in some respects equally new—mathematics, the language of business; and music, the language of emotion or sentiment. These two languages have had much to do with mechanism; for without instruments the mathematician and the musician would have made small headway, while without the exact notation of the mathematician and the musician the telescope and microscope would have been of little use, and the organ and piano-forte would not have existed. These two languages probably have much to do with each other in securing the health of the human mind; and God, who gave us the clattering locomotive, has given us also the soothing organ; and the age that is startling the nations with electric wires is cheering and charming them with pianos—those harps in boxes that are bearing their music to every backwoods village. The two languages agree in following the same law of numbers, and a symphony, like the solar system, may be expressed in arithmetic, and Beethoven, like Newton, is master of numbers, and sings the music of the spheres, which the astronomer counts in his calculus.

Behind all these new powers evidently we are to recognize that master-tongue of modern times, arithmetic, and it is of this, especially in its relation to the moral government of God, that I would speak in this paper. It is an old tongue, indeed; and, undoubtedly, men have counted numbers and distances ever since they had time to study their ten fingers, or to measure the relation of their own height to the rock or tree that they wished to climb, or to the man or beast that they were to fight. But in modern times arithmetic has become a new tongue by new signs and new applications. It now expresses all known masses, atoms, forces, and facts in its own peculiar way, and, annexing geometry to its jurisdiction, it has learned to bring all measure and form within its own terms and methods. Who shall presume to limit the triumphs of Kepler, Newton, and their peers in applying exact numbers to the observation of the masses and movements of the astronomic world? Who will refuse a place by the side of the great astronomers to the men who, like Berzelius and Lavoisier, have looked into the realm of atoms, and applied exact numbers to the proportions and affinities of the chemical kingdom? Nor does the conquest stop here. The facts and movements of human life have been studied with the same eye to exactness by a set of patient and sagacious men, headed by the German Süßmilch and the Frenchman Quetelet, who have looked for the numbers of God in the facts of history and the results of statistics. The German declared that God is the great arithmetician, who has not merely numbered the hairs of our head, but has also so made the whole world that every where proportion and order prevail; and the Frenchman affirms that the architect of the heavens is God of history and ruler of the intellectual and moral world, where the Divine wisdom has balanced all things; while he asks, with French enthusiasm, "But what hand shall lift the thick veil cast over the mysteries of our social system, and upon the eternal principles which regulate its destinies and assure its conservation? Who will be the Newton who will set forth the laws of this other *mécanique céleste*?"

I have no such presuming ambition as to undertake to play the Newton in this important direction, yet I may, without presumption, venture to look a little at what has been done in this way, and give a few hints as to the future of the study. It is worth noting that a German took the first serious step in this new science of moral statistics, and he, too, an unpretending theologian of the half supernaturalist, half rationalist school. Süßmilch, whose name I do not find in the great biographical dictionaries, published his first little treatise in 1742, and his complete work was published at Berlin in three volumes in

1761, under the title "The Divine Order in the Changes of the Human Race, set forth from the Birth, Death, and Propagation of the same." The German went on his plodding way of observing facts and studying averages, without making any shining mark upon the world; and it was not until over a century after his first treatise that the science of moral statistics, in its new and striking form, dashed before the public, in the famous work of Quetelet upon the theory of probabilities, in 1846. Since that date the whole subject has been freely treated, alike in its facts and in its relation to necessity and free-will. England and America have given conspicuous names to the list of writers, yet Germany still claims the lead; and I have before me from Erlangen, 1869, a volume of some 1200 pages from Professor Oettinger, of Dorpat, which is the first part of a work on social ethics founded on moral statistics. This book is a marvel of patient research and careful information, and we can not but be indebted to its pages for some of our facts and suggestions. The author, a decided Lutheran, is distinguished from other authors in this field by his decidedly religious point of view; and he shows his characteristic spirit by the slashing way in which he handles the English school of statistics, with its passion for imposing shows of figures. "No mission field can be tilled by English associations, no copy of the Bible can be printed, no Jew converted, no heathen baptized, no shilling expended on missionary work, without being set forth in some striking form of statistical tables. Am I in London, I can not pass over Waterloo Bridge without making a contribution to the statistical movement of the population. Even if I wash my hands in a hotel, I pay my part to the perhaps morally not unimportant calculation of the consumption of soap in Great Britain." The professor of theology of Dorpat goes for higher game than this counting of heads and of pennies. He looks down with a philosopher's pride upon English utilitarianism, as he looks with theological disgust upon French fatalism in the record of events and persons.

It is evident that the great truths and virtues can not be expressed arithmetically, and that all the numbers and forms of Newton and Herschel's science can not represent "Paradise Lost" or the Sermon on the Mount. Yet exact figures may help us to understand the facts and characters there set forth, and to appreciate their effect in history. The elder Herschel has wisely said that "numerical precision is the very soul of science, and its attainment affords the only criterion, or at least the best truth, of theories." We could surely be helped in our study of the Sermon on the Mount by an exact statement of the industrial, moral, and religious condition of the world when those master-truths

were spoken, and nothing would be more startling than a precise statement of the misery produced by the neglect of its most obvious principles. Under the beatitude of the peace-makers, what a marginal note could be written from the statistics of needless war in Christendom within the last ten years, or within one year! Goethe hit the nail on the head, as he often did, when he wrote, "It is often said figures govern the world: but this is certain, figures show how it is governed." Evidently, in order to know what figures or numbers really mean, we must have enough of the raw material, or the actual matter-of-fact records, to draw general averages and relative results from; and we must put our conclusions into such tables or diagrams as to enable us to apply them conveniently and safely to our estimate of causes and our calculation of probabilities in human life and social progress. It is evident, too, that any array of crude facts is of itself insufficient for moral statistics, although it is valuable to the historian; and if, for example, we knew the actual number of marriages, illegitimate births, prostitutes, crimes, and suicides in all nations at a certain period, we do not know enough for our purpose until we have made observations so continuous and thorough as to show us the tendency of conduct and circumstances, so as to estimate the intensity as well as the extent of the evil. It is, for instance, less important to us, in moral statistics, to know whether in France sixty or seventy thousand illegitimate children are born, than to know that for every one hundred children born of marriage some seven or eight illegitimate children are born, and that this percentage varies from year to year according to season, town or country, calling or religion.

It is, of course, of essential importance to count and sift our facts and numbers in every available way, and it is remarkable what light is thrown upon them by this course. Take, for example, the gross amount of suicides in France for the years 1826-60 as they are presented in the accounts given every five years. The figures, as they stand, are thus:

1826-30.....1739	1846-50.....3446
1831-35.....2263	1851-55.....3639
1836-40.....2574	1856-60.....4002
1841-45.....2951	

But call the first amount, 1739, the standard number, and put this at 1000, and reduce the other six sums to the due proportion, and we see at once the relative amount of suicides in these figures, 1000, 1301, 1480, 1697, 1993, 2093, 2301. We understand these figures better when we learn how many men and women relatively took their own lives during these years, and what were their ages, and the leading facts of their condition and character, and the proportion between their number and ages to the whole population.

I can not go into the details of the method of collecting and classifying various classes of numerical facts, and drawing from them the just conclusions. But it is obvious that in one respect our observations must be pursued in a way that differs from that of physical science—the science of astronomy or of chemistry, for instance. The science of moral statistics differs from chemistry in giving little room for experiment, and in requiring actual observation of facts that are independent of our will; since while the chemist has pretty much the whole world of atoms at command in his laboratory, the statistician has stubborn men and women to deal with, who are not ready to move at his word. In this respect he is like the astronomer, who observes but does not control the stars; but he differs from the astronomer in having capricious wills and impulses to deal with, instead of solid masses and fixed laws: and the movements of Jupiter and Venus in the heavens are far more easy to calculate than the movements of the Jupiters and Venuses of earthly society and kingdoms. Whatever absolute laws may be behind human caprices and conduct, those laws are not clear and simple as the law of gravitation, nor are the elements of the downfall of an empire or the ruin of a man or nation as definite and calculable as the elements of an eclipse of the sun or moon. We are obliged to await very patiently the turn of events to observe human lives and characters, and we can not be sure that our facts are reliable until we observe a sufficient number of times, and with due allowance for contingencies. Even in so simple a matter as drawing black and white balls one by one from a covered urn in which a large number are mixed in equal proportion, we find that we can not judge fairly of the proportion by drawing only a few times, but we must try many times, and may not be sure of being right until we have done so. The first twenty that we draw may be severally 9 and 11, or 8 and 12, or 13 and 7 of each kind; but if we try one hundred times the average will be 10 and 10. Human actions are subject to more contingencies, and are of more kinds, than these black and white balls. Hence the need of patient and repeated observation. Take, for example, so obvious a class of facts as the births of girls and boys. A few observations would seem to throw the subject wholly into uncertainty; for here is a family with seven girls and two boys, and there is another with six boys and three girls; here is a daughter-full house with no boys, and across the street there may be a boy-full house with no girls. But pursue the observation for twenty years, through a large population, and you reach the invariable average result of 100 girls to 105-6 boys. Hufeland has made the significant remark that, in every important matter of investigation, with 10,000 souls each year is enough, with 50,000

each month, with 10,000,000 every day, is time enough to state and establish the law of average experience.

It is obvious that if investigations are carried in this way into every department of life, and allowance is made duly for all the shifting and constant elements of history, the science of statistics becomes very broad and complex, and calls for the most delicate and comprehensive combinations of numbers and calculations of probabilities. The more facts and relations of facts we have, the more illustration is furnished of the prevalence of law; and as the minute register of physical observations illustrates the order of the physical universe, alike in the *universal* powers of creation, the *general* characteristics of climates and zones, and the *individual* conditions of persons, so the exact observation of the facts of human history and life illustrates the moral laws of the world—alike those that belong to the universal reason and conscience, those that bear upon races and nations, and those that relate especially to individual characters and conditions. We are a long way from any such comprehensive knowledge of mankind, but we are tending toward it, and the positive science of our time is doing something to show, what Holy Writ affirms, that God governs the earth, and the ages show forth His kingdom, and declare the prevailing law of His justice. Moral and not natural selection is the rule of the Divine kingdom.

So far as I can I will try to look at the currents of modern history in this light, and especially to study out the arithmetic of God in the developments of our nineteenth century. Perhaps our thoughts and researches will have more point by considering the events that turn upon the cycle of Napoleon Bonaparte, who is in many respects the central figure of our century, and the representative man of the Latin race, and its claims to dominion over the world. Frederick the Great and our Washington stand in the foreground of the eighteenth century, with its struggle for liberty; and it remains to be seen what men will stand in the front of the nineteenth century when its work of reconciliation is done, and the second Napoleon and the Emperor William take the places which sober history is to assign them. There has been a great deal of romance and rhetoric on this drama of our age: now let us see if we can not make out a significant result from the testimony of plain facts and simple numbers. Let us try to look at the world in the most prosaic way, and consider the facts of birth, livelihood, and death in the organism of our race in a few obvious relations.

I.—The first great fact of life is birth, and population is the source of national power and human progress. Birth and population depend upon sex, and the relation of man

and woman decides the existence as well as the character of the new generation. If we knew all the facts bearing on this relation in the nineteenth century, the knowledge would make us much wiser than any metaphysical essay or poetic dream. How far has the relation between the sexes been more healthful and pure in our age than the last century? what has been the condition of woman in the declining Latin races as compared with her condition in the rising Germanic races of Europe and America? and what is the present drift of marriage and home life in our Christendom? These and other like questions, if they could be definitely answered, would throw much light upon great issues now pending, and probably help us to see our way through the shadows that are gathering over the future.

The science of moral statistics is wholly on the side of morality and religion in this matter, and proves the validity of the idea of marriage of one man to one woman, which is taught in the Scriptures of our faith; and it also proves the misery, disease, and degradation that come from the infraction of the marriage law. As long ago as the time of Süssmilch, observations indicated that about one in twenty more boys than girls were born, or 105 boys to 100 girls. Recent and more thorough observations have not much changed this average, and the proportion of girls to boys among those born living is $100:105\frac{3}{10}$ (or 18 girls to 19 boys), while among still-born children the proportion of boys is larger, and among illegitimate children the proportion of boys is less. The figures differ somewhat for different years and nations, but they tend to the same general average, and to show a virtual equality in the proportion of the sexes, which assigns one man to one woman. This proportion is nearer absolute equality during the period which, according to a generous estimate, may be regarded as the period of marriage, or from the twentieth to the fiftieth year. About 25 per cent. more boys than girls die in the first year of infancy, and from the second to the fifth year about 3 per cent. more; and then the proportion of deaths is about even between the two till the fiftieth year, and the exposures of men to out-door dangers are about equal to the exposures of women to the trials of their sex from childbirth and other causes. In observations upon 80,000,000 of people in Europe the tables show a proportion of 100 men to 103-4 women, which, according to Oettinger, gives a surplus of 3 or 4 per cent. of women to remain unmarried, and to serve in sisterhoods, or as deaconesses, or in some other maidenly calling. If we count America into the list, with its surplus of men to balance the surplus of women in Europe, we find the proportion of men and women nearly equal; and a table of the population of twenty na-

tions gives 100 men to $100\frac{72}{100}$ women. It is remarkable that there are relatively more women than men in Scotland than any where else, and there are $110\frac{2}{100}$ women to 100 men; a fact probably explained by the number of men who emigrate from Scotland without taking Scotch wives with them. The result evidently shows that in spite of all trifling variations in certain cases, on the whole, during the marriageable period especially, the sexes fully balance each other. Nor do the Oriental nations where polygamy is practiced show a contrary result, since the rich men there buy women from abroad for their harems, and the poor men find it hard to obtain even one woman for a wife.

The proportion of men to women varies considerably in times of war, as is to be seen in the very full tables of the population of France since 1800. During the great wars of the first Napoleon enormous numbers of men were killed in battle or died in hospitals; yet the wonderful law of compensation revealed itself, and the proportion of boys born rose nearly 2 per cent., and in the three years most fatal to France—1811–1813—more than 107 boys were born to every 100 girls. It is not easy to account for this upon any of the usual theories, and we must ascribe the result in part to the relation of the family to the nation, and the effect of the desire for male children to restore the balance of the sexes, and recruit the strength of the empire. The mind and heart are factors of life from the beginning, and children tell the secret sometimes that their parents never spoke to the world. Undoubtedly many evils come from the disturbance of the balance of the sexes and the necessity for this power of compensation. Standing armies are fearful enemies to the purity of society and the sacredness of marriage. When in camp or on the march they are a moral pestilence to the whole neighborhood, and gather a host of loose women about them, whose ranks are likely to be recruited by new victims of lust and violence. Then, when the armies return home, they tend to carry their bad habits with them, and garrisons are more dangerous to their own people than to the enemy. The record of the wrongs done to family life in France and to the sacredness of marriage by the military policy of the Napoleons would be a more startling sentence upon the spirit of their dynasty than any new and ingenious reading of the mystic numbers of the Apocalypse. Something of the disrespect for woman that is so characteristic of the French, even when adroitly veiled in the compliment that most flatters her when most eager for her ruin, is undoubtedly to be attributed to the surplus in the number of women during and after the great French wars, and the consequent temptation on their side to pay court to men, and to consort with them in unworthy ways.

Careful observers have said that during that period more women than men died, in part because their lives were held to be of less account. The degradation of society goes with the decline of marriage; for moral and intellectual as well as physical traits are transmitted by generation, and not only disease, but folly and sin, go with the blood that flows from a union of man and woman against the Divine law and the best instincts and affections of the heart. Let nations respect duly the Divine law, and live in the sacredness of the marriage covenant, and they will find that new life is born into them; and while families fulfill their personal duties the God of nature and grace is working and bringing new powers and harmonies to all civilization. Birth will be nearer the new birth, and will help to resist that drift of wickedness which has been called the original or birth sin of the race. Oettinger waxes very warm on this topic, and in his way calls marriage "the fountain point, about which, as about a pulsating heart, all the veins and arteries of the colossal organism centre, in order to send, life-creating, the ever fresh yet ever the same blood streaming through all the limbs." Very justly he regards the whole register of the acts and results of marriage-breaking, illicit love, prostitution, criminal intercourse, as a record of sins against God, and proofs of His exact reckoning with the transgressors.

Few aspects of modern science are more startling to uninitiated readers than the attempts to measure exactly the force of the tendency to marriage. The common habit has been to estimate this tendency by its relations to certain social conditions rather than to essential human nature. Of course, vast many dispositions toward marriage have been stopped by limited means and social obstacles, yet those dispositions are none the less facts that are to be taken into the account, and likely to give signs of themselves in the long run. Many a *real* desire does not become apparent in act, and we must try in every way to note the existence of the desire. Thus, look to a very important set of observations upon marriages of an unusual kind. That very few marriages take place before the age of sixteen is explained by the absence of the necessity and the want of ability to keep house; but that more marriages are found to take place—as in Belgium in 1840–45—between persons from thirty to thirty-five years of age than between persons from twenty-five to thirty years by no means proves that the marriage tendency was greater at the former period, and it may be accounted for by prudential considerations, and the relative thrift of the parties. We are to make a fair estimate of the elements that enter into the marriage movement.

There is much truth in the saying of Mon-

tesquieu, "that wherever a family can live at ease a marriage takes place," and this remark indicates materially the point of connection between the frequency of marriages and the prevailing social economy. The universal instinct moves according to conditions that do not depend on individual will, and yet these conditions follow a certain order, as has been very clearly shown. It is only remarkable that there is less regularity in the absolute and relative frequency of marriages than in the thousand manifold combinations in respect to the age and civil state of the parties, as well as of the season of the year of the marriage. This regularity extends to all ages and positions, and it is more certain what will be the proportion of youths and maidens, bachelors and widows, or widowers with maidens, widows for the second or third time married, early marriages between sixteen and twenty-one years, normal marriages between twenty-one and thirty years, or late between thirty and fifty years, or abnormal after fifty, sixty, or eighty years, or of young men under thirty with elderly women over forty-five, yes, even over sixty or seventy years; and of young women from seventeen to twenty-five to men of seventy years and over, which may well be called monstrous, or marriages of calculation—we say that it is more certain what proportion of such various classes of marriages will take place than what is the whole average number of marriages. Strange as it seems, it is true, that the universal proportion seems less regular than the special. But the reason is obvious, from the fact that while the whole number of marriages depends much on the times and changing lot of the people, the various classes of marriage depend more upon general causes that belong to human nature in general. A year of famine or panic will reduce the rate of marriage, but they who do marry will be likely to show the same variety of tastes, infirmities, calculation, forethought, or folly, as in more prosperous times. The tables show that in fourteen different states of Europe the lowest average of marriages was the year of famine—1847—that followed the poor harvest of 1846. In Prussia the number of marriages in 1847 was 1 to 129 persons, in England 1 to 126 persons, and in France 1 to 141 persons, in place of the larger proportion of the year before, which records 1 marriage to every 116, 116, 131, severally, in those countries.

Throughout all these changes in absolute and relative numbers, it is surprising to observe the regularity in the station of the parties. Thus, in France, during three periods of five years each—from 1836 to 1851—the proportion of bachelors and maids was 83 per cent. in 100 marriages, with only a fraction difference; the proportion of bachelors and widows was 3 per cent., with the

same trifling variation; and the proportion of widowers and maids was 9 per cent., and only in the case of widowers and widows there was a falling off of about 1 per cent. in the usual average of 3 per cent. in the years 1841–45. Change the grouping of the figures for the same three periods of five years each, and we have only a fraction variation in the average number of different classes married. Bachelors average a little over 43 in 100, maids a little over 46, widowers a little over 6, and widows somewhat over 3 in 100. In eight nations the tables show, for a period of from seven to ten years, the following average numbers for every 1000 marriages: young men to maids, 811; bachelors to widows, 53; widowers to maids, 106; widowers to widows, 30.

It is interesting to note the variations of the marriage rate in the principal countries of Europe for ten years, and it is a memorable fact that Prussia takes the lead, and her rate of marriages (1844–53) is 861 to 100,000 people, while England (1845–54) gives 847; Austria (1842–51), 838; and France (1844–53), 788. Bavaria shows the smallest average, 659, but this comes from restrictive laws rather than from the degradation of the people, as the recent increase of marriages since the change of laws proves. We find that the different countries differ considerably from each other in the proportion of the classes of persons married, while this proportion is nearly constant in each country itself. As a remarkable instance of this, we have the fact that while in Denmark (1845–54) the proportion of marriages of bachelors to widows was $8\frac{2}{10}$, in France (1844–53) the proportion was $3\frac{7}{10}$, a difference of nearly 5 per cent. in favor of the superior charms of Danish over French widows in the eyes of young men, while England shows the average of $4\frac{3}{10}$, which is about 25 per cent. higher than the French, and 50 per cent. lower than the Danish. The ages at which marriages take place also show memorable variations in different countries; while each country tends to keep its own average, and England is as set in her habit in this respect as in most others. Here is a remarkable table of the rate of marriage of persons under twenty years, out of 10,000 married:

	Men.	Women.		Men.	Women.
England.....	240	1220	Sardinia.....	438	2709
Netherlands.	169	717	Norway.....	73	406
Belgium.....	234	887	France.....	245	1896
Bavaria.....	29	353			

Contrast these figures with the lists of marriages of persons over sixty and we have a different view of married life, as we learn that the numbers vary from England, which shows 99 men and 29 women married at over sixty years out of 10,000 married, to Bavaria, which shows 108 men and 22 women. Of the women married at over fifty, Norway shows 194 out of 10,000,

France 187, and warm Sardinia, where women mature so early, 121 blushing brides of over fifty are led, on the average, to the hymeneal altar.

The influence of religion and church upon the rate of marriage is a very instructive study, and it appears that there is a memorable regularity in the proportion of mixed marriages in each province usually, yet in times of political revolution or religious agitation the rate varies. Where the ecclesiastical spirit is moderate, and the rival Catholic and Protestant confessions are nearly balanced, as in Rhenish Prussia, the rate of mixed marriages for 16 years was 410 out of 4536, while in the almost wholly Roman Catholic province of old Bavaria, there were only 76 mixed marriages out of 7361 marriages. We have some odd calculations of the influence of mixed marriages on the education of children, and there has been a great outcry from the Romish quarter because at one time in Prussia the Romish Church lost some 5458 children to her communion yearly from this cause; since from evangelical mixed marriages 115,583 children were born, and from Romish mixed marriages 132,149, while of these children 121,041 were educated evangelical, and 126,691 Romish—a loss to Rome of 5458 children. This gain of Protestant education in Prussia is owing to social causes, especially to the general spirit of the people, while in exclusively Romish provinces the Romish Church grasps at the education of the children of mixed marriages, and gets more than her due share. Yet every where these influences tend to a certain constancy; and, let men argue as they will, individual opinion does not annul the reign of law. New motives have power, yet they work according to a certain order, and the rise of the manufactory system or the spread of Methodism does not change, but carry out, the laws of the social world. There seems to be no act of life which is more free than the choice of a partner for life, and whether it is made in the free impulse of youth or the sober reflection of mature years, the man has the feeling that he proposes of his own will, and the woman accepts or declines his proposition according to her fancy or judgment, with careful regard to friends, circumstances, and character. Our Jessicas and Lorenzos, as they make love to each other in the moonlight, follow instincts as regular and mighty as the tides which the moon raises. Thus over the whole sphere of love and marriage a certain order presides; and we note a certain average rate in the age of persons married on the whole, and also in the ages of the parties to various classes of marriages. Thus in England men at marriage average $28\frac{1}{100}$, and women $25\frac{26}{100}$; and in France men average a fraction over thirty years, and women a fraction over twenty-six; while

in Sardinia the men average a little over twenty-nine years, and the women about twenty-four and a half years; and in the Netherlands and Belgium the women average about twenty-nine years—a fact that should encourage the large and excellent class of ladies who are bordering on thirty, and in fear of the single blessedness which is supposed to be doomed by that period.

The statistics of divorce throw much light upon the state of society in Europe and America, and help thoughtful persons to make a due estimate of the sacredness of marriage, and the evil of slighting its authority. Yet there is a difficulty at getting at all the facts, because in Roman Catholic countries, where divorce is forbidden by the Church, it virtually takes place often by the entire alienation and separation of husband and wife, and the frequent forming of other and illicit ties, such as have been lately so powerfully set forth by Legouv  in his book on "Fathers and Sons." The German states record more divorces than the Latin states, yet married life in Germany appears to be more true, steadfast, and fruitful. The distinction between the German and the French idea of marriage seems to be this: the German marries more from personal affection and manly honor than the Frenchman, but with less recognition of conventional and ecclesiastical usage, and when the marriage proves uncongenial he seeks voluntary separation as quietly and fairly as he can; the Frenchman marries less from personal affection, and has less manly respect for woman as wife, yet he accepts the usages of society and the Church to a certain extent, and formally he keeps the bond which virtually he holds too lightly. The German needs a stronger sense of the positive and institutional authority of marriage, and the Frenchman needs something of the German's hearty affection and ideal loyalty; while the best people of England, and also in America, unite all three of the true conditions of right marriage, and marry for love, and also a proper recognition of ideal excellence with a serious recognition of the authority of the Gospel and the Church.

With divorce and all its attendant wrong to the law of God and the welfare of society the whole train of sensual perversities show themselves, and the monstrous phantom of prostitution comes in to appall us. The tables show an increase of the social evil every where; and while England has perhaps its most disgusting and obtrusive forms, France is mainly its patron country, and spreads the evil by stripping it of its odium. The French have been in this respect the corrupters of modern society; and the cycle of Napoleon—with its standing armies, theatrical temper, its worship of godless power and unhallowed pleasure, its want of profound personal religion, and its hollow deference to the pag-

eants of priestcraft, its neglect of the home, and contempt for woman as wife and mother, and frantic worship of her exceptional beauty and genius—has been a cycle of sin. Our German professor is somewhat strong in his language as to woman's rights and free love; yet there is much truth in his word when he says: "It is, as already said, the emancipation of woman and prostitution, both closely related, which stop the prosperous increase of population." The current public opinion on these two points acts hurtfully upon France. All individual members of society stand in this respect in a relation of mutual solidarity. For the worldly culture of to-day, as once in degenerate pagan Rome, the word of Tacitus holds good: "To corrupt and to be corrupted, this is called the age."

We in America are having our full share of this corruption; and perhaps we originate too much of the evil to lay the whole or most of the blame upon France. The figures of our census are the arithmetic of God so far as they illustrate the extent and result of our growing laxity of principle and tendency to show, indolence, and pleasure. Our population is far less than we anticipated; and we train our children in an extravagance that prevents marriage, or subjects it to unworthy conditions; and facts show that in the very communities where the privileges of education most abound they who should be good wives and mothers have neither health nor heart for their mission, and wrongs are done to the unborn that startle the conscience of the moralists who are familiar with the corrupt capitals of the Old World. All these facts should be set forth, sifted, and compared, and traced to their causes, and their probable results should be shown. It is clear that they concern us all, and that the new day of human fellowship is at hand, in which we are to regard the whole race as a great partnership, whose interests are part of every individual's business.

II.—I have no space now to enter into the other branches of the subject, and show the facts and figures that illustrate the life-work and death-register of our race. We are all born, we work, and we die. That is the old story; but we are learning to tell it as never before, with the same two main factors, ourselves and our circumstances, yet with much larger observation and distinctness than ever before. The old problem of free-will and fixed fate is working itself out more clearly; and we are seeing that we are freest not when we break away from law, but when we most sagaciously discern and most earnestly apply its principles and enjoy its protection. We are as never before to recognize the reign of law over ourselves and our race, and come within the jurisdiction of the justice that is the only safe rule for men and nations, as it is the eternal order

of the Creator of the worlds and the Father of our spirits.

Before our eyes evidently great things are taking place, and within a year events have occurred that have shown the necessity of our looking beyond the show to the substance, and carefully noting the exact numbers that count the wealth of nations and the fortunes of men. Within this century we have seen the ruling powers of the old civilization shaken, and we are asking what powers are to take their place. In the year 1806 the crown of the old Holy Roman Empire was taken from the head of the Austrian autocrat, and the upstart Napoleon undertook to stand in his shoes, and be Emperor of Europe and patron and vicegerent of Rome. Since then France has been, on the whole, the most conspicuous power in Christendom, and Napoleon has been the greatest name in Europe—a name that lived through the exile and tomb of St. Helena, and rose again in the adventurer who has played the part of Napoleon so as to lead the many to think the actor the equal of the hero so brought upon the stage. The actor has been driven from the stage. The empire fell at Sedan, and its fall was symbolized with derision just now by the overthrow of the triumphal column of the Place Vendôme. The emperor has disappeared, and the pontiff, too, has ceased to be temporal lord, whether of Rome or the nations. Who are to be emperor and pontiff hereafter, or what powers are to rule the consciences and the affairs of men and kingdoms? Powers there must be; for where there is life there must be law, and where there is society there must be order. King William and Bismarck seemed to be the masters of the situation, and now, as emperor and prince, they are the most prominent characters of our time. But exactly what forces are behind them who can tell? Who will presume to give an exact statement of the elements that met in the German and French war of 1870-71? Undoubtedly German science figured up the forces at command before the war began, and arithmetic had much to do with predicting the result. All the forces were counted, and the plans made in advance. Yet these calculations would have come to naught without the higher factor in the result—the heart of the German people as contrasted with the French. The German manhood went to the conflict with the French vainglory, and the strongest manhood had also the best science, art, and discipline on its side. The material elements on each side can be stated with some exactness, and put into something like an equation. There is something in the simple fact that Prussian marriages average 25 per cent. more children to a family than the French. But we must remember that figures are significant with God not by number, but position, and count units

and thousands as they have a commanding place. With the Germanic races generally the arithmetic of circumstance counts up toward character, and the items of materials, like the parts of the human body, wait upon the head, not upon the feet. In other words, the arithmetic of God *heads up* its bills under the rule of reason and conscience, instead of *footing* them up in impulse or passion. With God heads are greater, if not more, than hands or feet in the estimate of events, and the future is to be in the line of His providence, according as we know and follow His law in a genuine personal manhood, and a loyal sense of the order of universal justice, as well as the fair claims of our country and our homes.

How time is to bring out this truth I do not undertake to say, or what men and institutions are to rule. Very likely Germany may be impatient of imperial sway as of papal infallibility, and be more ready to look for infallibility to philosophers like Humboldt, and for command to engineers like Von Moltke, or to artists like Goethe. But Providence will guide free nations through their trial, if they are only true. With loyalty to truth and justice, the eternal order will unfold itself, and write out the figures that are the Mene, Tekel, Upharsin of tyranny, and sing in the harmonies and melodies that cheer on the march of the combined and continuous forces of the coming civilization, which shall join the kingdoms of this world to the kingdom of God.

BELLA'S BEGINNINGS.

YOUNG Mrs. Cavendish that was to be, at some time in the dim future, and Miss Slatterleigh that was, and that, for all she could see, was likely to remain, betrothed to the lover of her choice, but forbidden by her father to marry till her husband could furnish his own house, was in a state bordering upon despair. Nor could she discover any way out of this slough of despond, and into the fine establishment which both she and many of her friends felt it necessary for her to have; for Cavendish was in the law, and the small returns of his practice, add them over as many times as you would, always amounted to the same sum, a sum as inadequate to their united wants in the opening and garnishing of a home as a penny token would have been.

She used to sit down and picture to herself the house she wanted and the things she wanted in it. If she could not have it in reality, it was pleasant to have it in imagination; and she would locate it and build it and furnish it and add to it and improve it on every idle occasion that she had, only to see it tumbled down again by the next hard fact that gave it all a blow. Still, while she was about it, and as it cost her nothing

to speak of, she might as well have it the best there was to be had; and thus having undertaken the thing fancifully, it grew to have an actuality of its own, and it was hard to get the habit of it out of her head, until she had naturally, but rather unwarrantably, come to expect a beginning with something as superb as most people are willing to end with. As for the house itself which was erected in her imaginings for the future home, it was to narrowly miss being a palace, and was to cost a whole arithmeticful of money, to judge by the figures, while she herself was to move round in it dressed like a princess in a fairy tale, so far as magnificence went; for Miss Slatterleigh was a beauty, and knew only too well all the advantages to beauty of purple and fine linen. Her foot was to sink in the downy depth of carpets gay with all the florals of all the zones; the light that entered the rooms was to be sifted through curtains of priceless dyes; her walls were to glitter with gold underlying all soft tints, with marbles and bronzes and paintings; her rooms were to be cluttered with ormolu and majolica, and old china so hideous as to be handsome; with Elizabethan tables and Louis Quinze *étagères*; here an ebony chair upholstered in yellow satin, here a mother-of-pearl in crimson, here an *escritoire* in carved ivory; and there were to be velvet hassocks and ottomans and lounges, and gilded harps and grand pianos, and brackets and pedestals, with Apollos and Dianas, and holy Virgins and profane Venuses, in a huddle of dark, rich splendor, through which you could hardly see your way. It was of no consequence to her castle-building that in all this hurly-burly there would not be a single article having any association dear to the soul of husband or wife, or that the pair would only have stumbled round lonesomely among their possessions till they could find some little breakfast cabinet not too good to use, and to which a sea-coal fire might lend a sort of likeness to a home; that was an absurdity that never entered her head. That people could fail to be happy, or could find any thing dreary, in such a palace as she pictured, was to her mind an utter impossibility; and she said to herself that, for her part, she would rather wait for Cavendish till she was gray-headed than not have all things just as Mary Carlisle had had them, whenever she did marry him.

Meanwhile, it must be confessed, she found it weary waiting. Time was wearing on, too; perhaps her beauty would be really all gone before her wedding-day—and then, would there be any wedding-day? It is true, she had had a proposal from a millionaire no older than Mary Carlisle's husband, and much more agreeable; but she had scouted it, being in love. She meant that Cavendish should be a millionaire, or, at any

rate, live in something next to a millionaire's house; and, of course, she knew there was not the slightest prospect of it, unless somebody would retain him on a great will case in equity, or a great railroad case any where, and *hinc illæ lacrimæ*; for her heart sank within her to see his worn, pale face; to realize that youth, with all its buoyancy, was leaving them; that she was close upon her thirtieth year, and they seemed to be no nearer together now than they did five years ago. Five years ago—what a wilderness and waste of an engagement! Neither gods nor men had any pity on them, plainly.

"I don't know that I think it at all desirable you should marry, Anna," her father had said. "With your ideas, I can't see how you will avoid driving Cavendish head over ears into debt and suicide in a year."

"Father!"

"Yes, Anna. I'm speaking seriously. I'm sure of it. A man may have all the good principles in the Koran, but when he comes to be hounded on by the woman he loves from one extravagance to another, the end isn't doubtful."

"That is too idle, father. Neither I nor any one else could make Cavendish take one step that he thought wrong, you know very well!" said Anna, with tremendous dignity.

"I know you will make him take some steps that he will think Spanish," said the old gentleman. "What right have either of you to want more than your parents had when they started up the hill? And as for him—a bird must build his nest before he fills it."

"Oh yes, father, that's all very well," Miss Anna had replied. "But if you're going to natural history, you should have your illustration correct. Both birds help build the nest. And for my part, I don't know how to do a thing. You haven't brought me up to know. I couldn't bring my bird a straw of my own picking up!" cried she, half sadly, half defiantly.

"Well, Anna, there's some sense in that. I didn't know you had so much. It is very true that things should be equal; and if I haven't taught you to do your share, then the blame and the reparation are mine. Now I'll tell you what," said the worthy old citizen, taking his coat tails over each arm out of the way of an imaginary fire: "I'll make you a fair proposal. When you can find a little house, with, let us say, a dining-room and kitchen on the first floor, a drawing-room over that, three chambers and an attic (more than your mother and I had, by a great deal, and a perfect desert for two young people and a servant to be lost in), and Cavendish thinks he can furnish it—why, then I will make you a gift of the deed of the house, and the house is at 53 Ponce-deleon Place." And the worthy gentleman

stepped into the hall before she could reply, tugged on his big surtout, and, with his gold-headed cane, as stout as a policeman's baton, went out on his rounds.

A little house, with dining-room and kitchen, drawing-room over that, three chambers and an attic! Her palace, her ormolu and bronzes and carved ivories, dwindled into that! Poor Anna burst into tears—why, goodness only knows, unless it was for fear that she should accept the offer. And then her cheeks were burning and her nose was red, and Cavendish was coming in the evening, and if she didn't want to have him get tired of her altogether, he mustn't see her in such a plight as that; and she ran to rose-water for relief, and then betook herself to a walk in the sunshine to restore her color and her spirits.

After all, the poor girl was not altogether a fool; she was only misled by injudicious friends and unchecked desires. As she walked on, and saw bright, contented faces of husband and wife coming from market, and met rosy little children at their play on the sidewalks, she half admitted to herself that it was possible to be happy even in such a house as 53 Ponce-deleon Place must be. At any rate, it occurred to her that she would not be compromising herself if she just walked round and took a look at it.

There it was—a neat gray brick, with white facings, a bay-window, a balcony over that, a grape-vine over all; and there was quite a yard behind, in which she caught a glimpse of a pear-tree and an immense clambering sweet-brier. It wasn't her palace, to be sure; but then it wasn't so bad, after all. And just as she came to that conclusion, whom should she meet but her father, pompously swinging his cane as he paused to survey it, with a sort of pride written on his face, that said he thought if he was going to do this for his daughter, he was going to do very well for his daughter. Anna would have liked to sink into the ground; and that lofty and melodramatic method of disappearance being impossible, then to sneak down some alley-way; but there was none; and so she had to pass the old gentleman, and they quite laughed in each other's faces as they went their ways; one a good deal encouraged in his child, and the other something more light-hearted than her wont. "What in the world," thought the old gentleman, "a girl wants to marry and leave a comfortable home at all for, passes me. But, at all events, if they will marry, this looks a little hopeful. Perhaps she isn't the simpleton I've taken her for. Her mother's been filling her head with French notions this last ten years; but this looks as if there were some Slatterleigh left, after all. I don't know, if I find she's really rational, but I might do more—find the carpets, or the piano and book-cases. I've no

notion she should suffer any more than to get rid of her nonsense needs. I've no notion a daughter of mine shall go shabby, either. Cavendish is a deuced smart fellow; I want to do the handsome thing by him—all the more because I may be taking him in a little in letting him have the girl at all. I don't know, though; this looks hopeful."

And as for Anna, she was wondering, for her part, if she accepted the house, what under the sun they could furnish it with. "I don't believe Cavendish has more than a thousand dollars in the world," she said. "For that endowment policy for his mother takes about all he could lay by above expenses. And who can furnish a house with a thousand dollars, I should like to know? Why, the carpets would cost more."

She was thinking it all over, and wondered whether she had better tell Cavendish any thing about the little house that night or not, when she found herself in Bella Vining's neighborhood. Bella, whose family had a pedigree as long as the law, but hardly a piece of silver to cross their palms with, and who, herself, had married a man with a salary not any more than equal to the sum which Mr. Slatterleigh had allowed Anna and her mother for their dress, not to speak of their flowers and perfumes and confectionery. It occurred to Anna all at once that it was high time she called on Bella, and then while she was there she would look about her and see what love in a cottage was like; not that she meant to do any such silly thing herself as Bella had done, but then it was well to regard all sides of a matter.

It was a dark and narrow street that Bella lived in, walled in loftily at either side by mansions once belonging to the old noblesse of the city, who had left them long since, however, for airier abodes; but the street ran down to the bay, and there was a delightful vista all the way through, and at Bella's house there was a slight projection which must make the vista a perpetual possession of the front parlor. And what a little gem of a house it was! As Anna turned her head from side to side of the pretty parlor she almost confessed to herself that it was really cozier and pleasanter than a palace, though she shivered immediately afterward with apprehension, as if the mere thought were half a pledge. And what a darling little maid, in white bib and tucker, not ten years old, had let her in, and now came to her side and said Mrs. Vining would be down directly! Anna could have kissed her, but for her fears of the effect of such an act upon the discipline of the household. Perhaps, she said, they had canaries trained to draw the water, and educated mice in the pantry, and learned fleas for the errands.

"Oh, Bella!" said she, as Mrs. Vining entered, and forgetting all formality, "do you

believe I could find such a quaint, delightful little maid?"

"Oh, Anna!" said the other, "a hundred of them. She is only the cook's daughter, who has her living and her tiers for waiting on door and table." And then, at the simple little confession, it flashed on Anna that here was the person for her confidence and her consolation, and she would swear her to truth on the bones of all her grandmothers, and then learn if, being married on nothing, she had ever regretted it. And out came the whole of poor Anna's story; and when she had told it she blushed for shame, for, translated into plain words, there seemed to be nothing of it except that she did not love her lover well enough to do without luxury for his sake.

But Bella did not look at it in that way at all. Her heart swelled with sympathy. "Regret it?" she cried, with flushing cheeks, and quivering with eagerness to add another martyr to the fire. "Oh, regret it! Why I never knew what happiness was before—oh, never, never! And as for the nothing part, the income—why, it's just like the parable of the loaves and fishes, and Charles freely admits that there is more to spare now than there was in the old times when he only gave me gloves and bonbons and took me to concerts. He saves it in his clothes alone, my dear. Oh, you don't know! We keep house together, we do indeed, almost—yes, almost for what it cost him once to board alone. And I knit his stockings and make his shirts and re-seat his trousers and bind his coats, and when it isn't to be done any more, sell his old clothes for ground-glass vases—"

"Oh, well, then, Bella," said her listener, in a comical solemnity, "it's of no use my talking to you, because I don't know how to knit socks and make shirts and seat trousers; and I don't want to know, for I'm very sure it never would pay in the world, if I had to slave after that fashion."

"Slave!" said Bella. "Why, it's mere happiness—in the evening, when he's reading to me. Sometimes then, when the storm is all wild and white outside, and the air is so still and soft inside, with the shade on the gas, and I look at him in the ring of the light, and listen to his voice, and watch the smoke of his pipe curl up, and it all is so delightful, so secure, I say to myself, This is our grave; we are in heaven! Oh! how can I be telling you so much? Only that I want you to be just as happy!"

Perhaps the little creature's ecstasy softened Anna the least atom in the world more.

"Well, it may be all very nice—if you like it," she admitted. "But there! it's of no use for me to speak, even. I wonder I should make such a fool of myself! I don't suppose Cavendish has more than a thousand dollars in all the world to begin with. That might

get a Kidderminster and an oil-cloth; but as for any thing more—"

"Now, Anna dear, as I've been so open with you, I might as well tell all the rest," cried the impulsive Bella. "Just come over the whole house with me, and let me show you every thing; and then you shall guess how much it all cost, and I will tell you the solemn truth."

So over the house the little procession walked. Not much of a walk, by-the-way, since at the top of the second staircase there was a partition; and Bella confessed to Anna that the upper stories were rented to another young family, who used the door opening on the alley, and had no more communication with them than with any other household. "You see, it saves us half the rent," said Bella, "and so we can put that by toward the rainy days," and she opened the door of the remotest room—the servant's room. Anna glanced in, and saw straw matting, painted pine, copper-plate counterpane and curtains, a lithograph of the Virgin of the Veil above the bed. Neat, if not alluring. The next room was the spare chamber. Straw matting again, with a large square of bordered Brussels in the centre, a handsome black-walnut bedstead and bureau, a great arm-chair covered with silk dimity, some straw chairs and a straw lounge, white book-muslin curtains tied up with blue ribbons, a toilet-table where some shining blue stuff was draped and fluted underneath the same muslin, a Parian copy of a grape-crowned head of Ariadne, and two or three engravings framed in passe-partout and decorated with plumes of grass—as cool and airy as some snowy cave, with all its blue-green light. "That room," said Bella—"that whole room cost me not quite one hundred and fifty dollars."

"What!" cried Anna.

"Yes, it did," said Bella, emphatically. "I will tell you all about it. I found the matting at an auction sale, though it was spick and span new; the Brussels square and the bordering were remnants, and I had them for cost. I looked at sets of furniture, and they appalled me: there was nothing decent till you came to three and five hundred dollars; but I came across a bedstead in one place that had been made to order and never taken, and an odd bureau at another. So I got my set for eighty dollars. I made my own mattresses, I and an old woman; it's perfectly easy, I assure you, with a long mattress-needle. As for the arm-chair, we made that ourselves too, out of an old hogshead; we did indeed—you needn't laugh: it's as comfortable as a throne; and we covered it with a quilt of my mother's; and we cut the engravings from an old *Art Union*, and framed them. But this is what I consider our greatest triumph," said Bella; and she ran to the toi-

let-table and lifted the muslin, with its quillings and ruchings and all its fluted sarcenet underneath, and disclosed an old pine packing-box.

"Bella, you are a little witch!" cried Anna.

"Am I not? Well, I do think this room is an achievement. But my room is better still. Here it is. My bedstead there, with all that beautiful white and gold lattice-work, is only an iron one, and cost almost nothing. My carpet—well, that was extravagant, perhaps, but I meant my room to be perfectly beautiful; and then I thought that pale mottle would just match the pale chintz curtains and toilet-covers and chairs; and as for the dressing-table, the ottomans, the footstools, they are all old packing-boxes again; and the easy-chair is a barrel; and that little hour-glass table, covered with the chintz, was made out of two old barrel heads and a broom handle. Of course all that took time; but then time was the only thing I had too much of. Then I bought the china sets and vases from an old-clothes man, as I told you; and there isn't any frame but the paper one, with the pressed autumn leaves pinned all round it, to that old second-hand looking-glass; and we bought little mouldings of white wood for those bright water-colors of mine; and Charlie cut the brackets out of cigar boxes, and polished and oiled them. And as for the flying Mercury, I always wanted one, and, of course, I couldn't have it, for it costs fifty or sixty dollars; so I contented myself with this plaster one painted green, with gold powder rubbed in: it looks a little like the flying Mercury, and a little like a huge grasshopper; but it brings such an aerial sense of springing strength and lightness into the room, that I am glad I have it, if I *did* pay five dollars for it."

"Oh, Bella! and to think of the fifty dollars I waste almost every week of my life!"

"Well, you have it to waste, or else you couldn't," said the practical little matron. "But about this carpet. When Charlie gave me the money for the house, I said the first thing is the carpets, and the halls and parlors and dining-room must have nice ones. So I knew Mrs. Burleigh was just going to buy new carpets, and I thought if we could get them off the same pieces we could get them at wholesale price, for she wanted ever so many hundred yards, and I wanted a good deal; and we went together to a wholesale place, and—just think!—all that carpeting for two hundred dollars!"

"Two hundred? Why, I thought carpets—"

"Yes, indeed; two hundred, and no more. Then I went to the owner of the house and fairly talked him into taking out the old fixtures and putting in new ones, perfectly plain, dark ones up stairs; but in the drawing-room these tiny gilt ones, with all their

fine chains, just like pieces of Roman gold jewelry; and in the hall that little bronze Hindoo boat full of flowers, you remember, that the girls on the Ganges send out with a light to tell about their lovers. You don't know how much they have to do with the effect. He said, though, he shouldn't do it for every one; but he liked my pluck and my taste, and having the plain ones up stairs and in the dining-room saved them to him, as he could use the old ones in a new house, too. Then I padded the floors and the stairs, and had the carpets stretched over them, and made the hassocks myself. Isn't that crimson beautiful? And Charles had a splendid leopard-skin to lay down before the fender; and we got some light, spider-legged chairs painted black—a dollar a piece—and sewed on springs, and stuffed them, and then tacked on a bit of canvas, and over that a bit of carnation cloth with gilt-headed nails—see, you couldn't find any thing prettier in ebony. I bought a real parlor arm-chair in that same cloth—a perfect sleepy hollow—and a little bit of a marble-top, and one mirror—at an auction, to be sure. You don't know what you can do at auctions till you hang round a little; and Charlie had that lovely library table, and the low book-cases and busts, before."

"Oh, how fortunate!" cried Anna, who had forgotten all about palaces, and was quite rapt in this delight of making both ends meet. "But there were your windows, and your dining-room, and—"

"My four windows cost me just fifteen dollars. For I bought that imitation Nottingham lace, and I edged it with imitation Cluny; it looks just as pretty, and washes just as well, and I should like to know who's going to stop and examine it. And then in the dining-room, chairs and Turkey red curtains and an extension-table, cheap, but covered with a beautiful cloth—for Aunt Maria gave me my house linen, loads of it, and Aunt Jane my glass and china, as your aunts will do, you may rest easy, and more too."

"But then the kitchen?"

"Oh, pa gave me the kitchen furniture: it was all he could do, with my wardrobe too, you know. And he told me to take my piano—that cottage—and one of the old family portraits. I chose my great-grandmother, when she was a little girl, with her parrot on her wrist. And then the wedding presents came, Anna. You don't know how they eke out and fill up the chinks. Not a great deal of silver, but all those little bits of paintings—two or three from the artists themselves, who happened to be friends of Charlie's—those lovely chromos and statuettes and book-racks, and that pedestal and head. It did seem as though I had been making friends all my life with an eye to my wedding presents."

"Absurd, Bella! I didn't give you any."

"Why, yes, you did. Don't you recollect years and years ago giving me that china flower-pot? Here it is. I had been growing that ivy in it for all those years on purpose. Just look at it; doesn't it seem to be alive, so green and dewy? could any thing be lovelier? Isn't it the most charming, cozy room in the city?" cried the young wife, enraptured with herself. "Only one thing—my lounge—I forgot. I wanted one, of course; but they were a hundred and fifteen dollars and upward, and what I should do I didn't know. And then, just as I was ready to die with the blues, an idea struck me; and I went to a new upholsterer and I said—I must tell you—I said, 'Can I find a box here of such and such dimensions?' I forget now the feet and inches. And he said, 'Oh yes; for four dollars.' So I bought it. And then I said, 'I want to have a common, cheap spring mattress fastened upon that; how much will that be?' He thought about ten dollars. So I went away and bought my carnation cloth; that cost fifteen dollars—you know it is an immense width; and I cut off enough for my pillows, and made and covered and corded and tasseled them, and carried the rest of the cloth to the upholsterer, and asked him what he would want to let one of his men tack that on my box 'ship-shape,' and he said he guessed a couple of dollars. And when it was done he brought it home, and I put on the pillows; and he stopped and looked at it a minute, and then at me. 'Well,' said he, 'if you ain't the dashedest smart woman I ever come across! You got out of me for thirty dollars what I ask a hundred and thirty for.' And I felt as pleased as any prima-donna does when her audience applaud *her*, I can assure you. And Charlie thinks—oh, I can't tell you what Charlie thinks! But the whole furnishing of this house, Anna, cost him just six hundred and sixty-five dollars and thirty-seven cents!" And here Mrs. Bella broke off to catch the breath that had run away with her, and went to bring her guest a bit of bread and some wine, for she knew Anna must be ready to faint with listening to her nonsense; but she had wanted Anna to see how much respectability and beauty and happiness could be gotten out of how little money.

"I don't dare to think of it," said Anna, when her hostess seemed to have run down. "I can't beat down people, as you can, by just looking innocently at them. I'm thirty, and awfully dignified."

"Oh, I'll go with you."

"And as for all that machinery of packing-boxes and chintz and brass nails, what is the use of beginning so, when I should certainly break down in the first year, and cry my eyes out for a thread lace bonnet, or something I used to have and can't now?"

"Well, to be sure," said Bella, greatly dampened for half a moment, "all that depends on whether you care most for thread lace bonnets or Mr. Cavendish."

"I wonder how it would do," said Anna, taking no notice of such a thrust as that, "to furnish one's whole house with those old-fashioned cherry-wood things—high-post bedsteads with testers, and chests of drawers with brass knockers to the ceiling—that you find in second-hand stores—buy them for old fire-wood and have them cleaned?"

"Old fire-wood!" cried Bella. "Oh, you dear little idiot! They cost ten thousand times more than the best carved rose-wood that ever was. Somebody lives on Fifth Avenue, though, that burns rose-wood altogether, but he's the only one in the world can afford such fire-wood!"

"Well, then, I don't know what is to become of me; because, you see, I haven't an atom of mechanical skill, and I never can do these things."

"Not if I come and help you?" asked the insinuating Bella.

"What would be the use of that," the other asked, "when it isn't merely beginning that way; it's keeping on that way? Suppose— Oh, dear me, what's the use of supposing? Good-by. I'm going to bring Cavendish round to see you, any way. May I? I'm so sorry I haven't been before! How good you are to me!" Kiss, kiss, and she was gone.

I'm sure I don't know what Anna is going to do about it. But I met her walking around Poncedeleon Place with Mr. Cavendish that very night, and I fancied that she must have quite forgotten about her palace. And as I know Cavendish has left off smoking, and every time he feels like taking a cigar is dropping the price of one into his strong-box, and as Anna is hoarding all the checks her father gives her for her autumn dresses and new jewelry, and is turning her old silks, I think, with Mr. Slatterleigh, that things look hopeful; and I shouldn't wonder if 53 Poncedeleon Place were furnished soon, and without much recourse to packing-boxes and sarcenet, if Mr. Slatterleigh has his way. At any rate, I met Anna going home the other day, followed by a small boy bearing an enormous plant, and as she ran up the steps to let him in I heard her gayly singing to herself,

"Oh, a rare old plant is the ivy green!"

NOT TO-DAY!

THE earth is frozen beneath our weary feet,
And we would fly away!
Yet the familiar sunshine seemeth sweet,
Tempting us here to stay.
Joy so crowneth sorrow,
Let Heaven come to-morrow—
Not to-day!

APIAN PSYCHOLOGY AND SOCIOLOGY.

CERTAIN insects of the order *Hymenoptera*, to which the honey-bee has won attention, present, in evidence of their fellowship with us in the great spiritual commonwealth, a sociability ennobled by the sentiment of devotion toward their queen-mother, feminine soul of the hive, and who represents for it the ideas of the species, of corporate unity, and of the future life, attained by continuity of generations.

Anatomy, which denies sensibility to the mimosa, because no plant reveals a sensorium to the scalpel, long begrudged to the insect those attributes of self-conscious, intelligent will which in man, beasts, birds, and reptiles employ a true brain as their organ. Now, science withdraws this objection. A few years ago one of its distinguished professors, M. Felix Dujardin, of Rheims, verified in the nervous system of insects a centre of true brain, above the throat, imbedded among air tubes, salivary glands, and fat. Hardened by alcohol or spirits of turpentine, its form and structure appeared, beneath the microscope, in regular convolutions, like those of our own cerebral hemispheres, and the outside pulp removed, left nerve tracts winding into a whiter and firmer substance, like the nucleus of the white in vertebrata.

Pulpy matter alone constitutes the thoracic and abdominal ganglia, seats of instinctive functions that persist after the head is cut off, and which conduce to self-preservation, nutrition, and propagation. The more a generalizing intellect and social sentiment transcend the narrow limitations of individual life, the larger are the masses formed by the white substance in question relatively to the whole weight of the body. These, in the social bee, constitute $\frac{1}{940}$, but in moths only $\frac{1}{33000}$.

The neuter ant, incased in its shell of mail, has fewer personal wants or liabilities to injury. The cortical pulp of its brain is proportionally reduced, and its parts insulated, these little brains amounting to about half the brain substance; whereas in the social bee they compose but a fifth part of it.

This structure gives a key to those marvels of the social life of ants witnessed by Bonnet, Huber, Latreille, Lacordaire, and many others, in which they exhibit a specialized intelligence, without superfluous accessories, such as complicate the problem of human behavior with interests beyond our reach in this life, and perhaps, indeed, in any other.

For studying the ways of bees M. Dujardin used Beauvoy's hives, arranged for daily inspection. Into two of these, containing bits of honey-comb, he introduced two swarms, and placed them side by side. The

first problem examined was whether the bee, like man, brings study to the aid of instinct in noting places and directions. When a pigeon, a swallow, or a bee is carried far away from its home in a basket, and on being let go, strikes a "bee line" to return, we ascribe to the animal a kind of geographical conscience deficient in ourselves, and which we supply by scientific instruments. But the bee seems to be heedful of the Horatian admonition:

"Ne Deus intersit nisi dignus vindice nodus."

It does not employ its transcendent co-spherical intuitions in the small details of domestic life.

When a swarm is placed in a new hive a few come out at first, and soon re-enter; then a few more, or the same issue again, and fly but a little way off, keeping their heads turned in the direction of their dwelling, as if studying its aspect, so as to recognize it on their return from pasture; then they explore the surrounding objects, and finally take a bold flight in quest of booty.

One of the hives, ill provided with honeycombs, had no royal cells constructed as the fall advanced. Its sparse population might not withstand the winter without aid. M. Dujardin accustomed the bees to take moistened sugar and honey from his hand. They would alight on him as on a flower in the garden, and eagerly run over his hands. He then tested their power of deliberate observation and that of communicating to each other the knowledge of places and facts. About twenty-five yards from the hives he made a hole behind a vine trellis, and placed in it a saucer of moist sugar. Then, enticing with some sirup on a little stick a bee in another part of the garden, he carried it while feeding to his *cachette*, and left it on the sugar. When it had filled itself it buzzed about in the hole, then here and there before the trellis, with its head always turned toward the hole. At last it took flight for its hive, and went inside. A quarter of an hour passed without any bee coming to the hole, then thirty came in succession, exploring the locality, seeking and finding the entry to the hole, and making afterward, apparently, the same little tour of observation as the first bee.

On the following day the bees of the same hive came in still greater numbers, but none from the other hive, as was carefully verified—the flight of the first being directed exclusively between their hive and the hole in the wall, while the bees of the other hive took an opposite course over the walls to the gardens adjacent. When the sugar had become dry its privileged customers abandoned it; yet, from time to time, one would come to inspect, and whenever it had been moistened, the bee that found this out would, after sucking it and returning home, be pres-

ently followed back by many others to the saucer in the hole.

The virtual communication of facts, as well as of emotions, by the *antennal touch* is a feature of insect psychology too well confirmed to need more than mere allusion to it here. It may be the better conceived of by those who have witnessed, as we have, the intelligent touch of Laura Bridgman—sole avenue to her consciousness of impressions which in other organisms take the sense-channels of sight and of hearing. The annals of catalepsy abound in illustrations of this catholic touch;* and mesmerism has shown that, while spontaneous in its exercise, it is capable, like other faculties, of a much greater development by culture. It receives this among some species and individuals, while others neglect it under the distractions of the eye and ear.

From the little *object lesson*, so easily repeated, and which every apiarian can match with parallel instances, let us proceed to evidence of analytic faculty in the apian mind. To plaster and varnish the joints and cracks of their dwellings something *viscous* is needed, and this the bees usually get from the fragrant resins of plants; but their fragrance, as well as their color and taste, are indifferent to the purpose in view.

It puzzled our professor to guess of what substance were the little white shreds of irregular shape with which he saw his bees flying laden. At last he discovered them in the act of pulling away these shreds from a coating of white-lead upon a third hive which had been newly painted. Now stickiness was the sole point of resemblance between this white-lead and the substances usually employed by bees. They could insulate the perception of this essential quality from its accessories.

Passing now from the sphere of peaceful industry to that of military enterprise, we shall find not merely the blind courage with which self-preservation inspires individuals to resist aggression, but a reflective enthusiasm and methodical combination for movements offensive and defensive. Mr. Crève-cœur (*American Cultivator*) is the observer. One day he saw a bee-eater perched on a branch near the hive, and seizing the bees one by one, as they rose, with a snap of his pointed bill. This bird had already devoured a good many citizens, when some one, avoiding the danger, seemed to have given the alarm within the hive; for Mr. Crève-cœur soon saw a number of bees come out, flying tumultuously, as though disposed to swarm. They formed in mass, and darted like a cannon-ball against their enemy, who, frightened, with good cause, "vamosed the ranch."

* For details consult cases of Nancy Hazard, etc., *Boston Medical and Surgical Journal*, v. x., nos. 4 and 5; and *New York Medical Repository*, hex. 2, vol. i., art. 1.

The apian phalanx, it appears, however well suited to a charge, was not adequate to a prolonged fight. The bees failed to follow up their victory, and their enemy once out of sight, they dispersed. Soon afterward the bird resumed its perch of prey, and Mr. Crèveœur had to bring his artillery to the rescue.

In this case a rather complex idea or narrative of facts concerning the nature and direction of their danger, and of the means of averting it, must have been communicated. One or a few bees witness the aggression, note the quality of their big neighbor's affectionate interest in them, and rather object to it. They concert means of obviating this fact, of resisting this tariff upon industry, of frustrating this stratagem. Bird, they will fly at it; foe, they will fight it; monster, they will oppose to its magnitude their consolidated phalanx and devoted unison. A mutual consciousness of danger enkindles the corporate spirit of the legion, which collective friendship marshals, and the fire of indignation hurls upon their foe. Is the deliberate purpose of patriotic ambition less evident here than at Thermopylæ or Marathon?

But this enthusiasm explodes; this prowess, like most human prowess, evaporates in the vain fumes of glory. Their object escapes them; and the same injurious provocation to their civic heart meets not a second time that organized resentment which it should have met invariably were that blind notion of our conceit yclept "animal instinct" a true version of the facts, or were the bee a "machine of God" in any other sense than as we all may be. The reflection implied in this extraordinary corporate enterprise reveals, less elaborately, indeed, than their architecture, but with the improvised charm of spontaneity, the faculty of strategic combination. Here passion reasons, as there mathematics becomes sociable. Their emotional impressibility touches our sympathies more than their skill in departments where we have introduced that formidable slave of genius and despot of humanity, the machine. We may undervalue their perseverance, their geometrical constructions, and division of functions, which we carry so much farther, and apply so disastrously to the artisan or to the soldier; but we frankly admire their ability to meet new contingencies by varied devices.

The geometrical order of apian architecture is too admirable not to have been cited by the "animal machine" philosophy against the *mind* of its authors. This assuredly, they opined, was the *nodus dignus vindice Det*. We, on the contrary, see no justice nor reason save in ascribing to each being the merit of its works. If the bee is a mathematical machine, then why not Zerah Colburn and so many others who have a special talent only in this line? To each his due.

The hive bees, moreover, like the wood-borer, will forego their mechanical labors if they find empty combs or suitable holes prepared for them, and the economy of manufacturing gutta-percha combs, that may be taken out, emptied, and replaced, is now being discussed in apiarian councils. Then honey, instead of wax, will be made by the bees during the first weeks of the season of flowers. The bees do what is most convenient. This is the secret of their geometry, as Buffon guessed in watching them at work. The arrangement of the combs appears to us a much simpler affair than the hexagonal cell; but not having, like the latter, a natural measure in the apian body, the normal space of half an inch for the lane between two combs is often missed. The essential point is that two bees, walking each upon one of the combs, shall be able to pass each other without touching. This space allows of ventilation; but as too much air is worse than too little, so, if the base of a second comb proves to be too far away from the first, we find the bees shaping it obliquely, so as gradually to approach the first, as it is built up. Dr. Brown cites a case in which the centre comb of a hive, filled with honey, had swung from its fastenings and obstructed the passage. The next inspection showed two horizontal beams constructed of wax between the two combs, while honey and wax enough had been removed from above to admit passage, and the comb detached had been secured by another beam, and fastened to the window of the hive with spare wax. They next proceeded to remove the two now useless horizontal beams.

The bee cell is often spoken of as if it were a hexagon of always the same size; but besides the deviation from this model for the queen cells and the drone cells, those which are reserved for storage are deeper than the rest, sometimes eight-tenths of an inch, with a diameter of one-fifth of an inch. When the honey harvest is ample, old cells are lengthened and new ones made larger; conversely, when Huber had often interrupted his bees in their work, they shortened their cells and lessened their diameter, gradually adapting them to the moral pressure of circumstances, as, in our own *res angustias*, the mansion contracts to the cabin.

It has been averred that the bee on West Indian plantations, seduced by the favors of fortune, has renounced industry, to share with man the treasures of the sugar-house, where it becomes a troublesome guest. It may fairly be inferred from the known habits and character of the bee that superficial observers have only seen there the same accidents as occur in our sugarrefineries here. Abandoned to the passion for sweets, intoxicated perhaps by their aroma, thousand after thousand alight upon the hot sirup, which is for them a crater; and apiarians, to save their

bees, have been obliged to wire-gauze the windows of these factories. Then the bees, disappointed of their sweet death, to which the vapors of the caldron powerfully attract them, are seen buzzing with rage against the window; and for a long time, like the besotted frequenters of our dram-shops, or gamblers fanaticized by the excitement of risking all for rapid gains, remain insensible to the gentle voice of Nature recalling them to moderate and wholesome rural labors.

All artists' souls are subject to the tyranny of completeness. *Le mieux*, says the French adage, *est l'ennemi du bien*, and the ideal often kills the actual. The tension of enthusiasm is too close a neighbor of intemperance for the votaries of one not to slip sometimes into the other. The bee is no exception to this rule. It has even the same passion for certain narcotics as Coleridge or De Quincey, and many bees perish in the fields of Hindostan after their long spree over the cups of the poppy, because when it has done blooming they can not reconcile themselves to more insipid flowers—can not forego their cherished dreams. Apiarians court their favor by sprinkling them with sweetened anise-water. These refined tastes, and the odors with which they are associated, border, like the musical sense, on the regions of ideality and sentiment.

The following observations suggest that, while emotion may paralyze their ordinary faculties, they know their own weakness, and plan to avert a catastrophe which overcomes their moral force. A formidable problem for the bee is the *Sphinx atropos*, the death's-head moth, that sips in the evening the honey of flowers, and is partial to the same when already collected. Hence its plunder of the bee-hive, where, although unarmed and unmailed as to its body, it inspires such a superstitious terror that it escapes the poisoned dart. Bees have even abandoned their hive, like a ghost-haunted mansion, to this intruding moth. What can the bees, which do not hesitate to sacrifice their individual lives upon the slightest motive of resentment—what can they fear from a soft thief that can not wound or even irritate them? M. Frairière suggests the resemblance of certain sounds with their emotional association. In the evening stillness of the swarming season the queen's note is distinct and peculiar. As when at the muezzin's sound all true Mohammedans fall upon their knees, so at the first thrill of this weird chant all work is stilled in the hush of emotion.

Now, when we take hold of a *Sphinx atropos*, it usually gives forth a kind of cry or sound very like that of the young queen's, and, moreover, it produces a sort of electrical numbness by vibrating its body in a very queer way; so that to seize it, even through a fold of muslin, you must overcome squeam-

ishness: such are its sensible means of intimidation. To the bees it is an enemy of their *species*, which borrows the voice of their beloved young queens, and those very tones which thrill their apian heart with passive emotion. Glamour and witchery await not idle hours; they attack the bee, as well as the Yankee, in the midst of multifarious industries. Nervous impressibility suffices. In order to sip honey unmolested, the sphinx needs but to utter its awful note. And yet these bees do not passively await a second or third visit from the lepidopterous conjurer. Their civil engineer corps defends the entry of the hive with waxen walls, leaving holes only large enough to admit the body of a bee. Other hives oppose little bastions that can be turned only by a zigzag course. Each apian tribe invents some indirect expedient of its own, but none dare face the music, or take the butterfly by the horns, *in propria persona*.

In 1806 the *Sphinx atropos* abounded, and broke the combs up with their heavy bodies. At first the bees seemed to be confounded and demoralized, but soon began to raise waxen bulwarks which left space only for themselves to pass in single file. This expedient was renewed in defense against the same enemy in 1809. This method also serves them against others. Mr. Jesse shows a fort built of propolis with which one of his families of bees withstood the attacks of wasps. By narrowing the entrance, a few bees could effectually defend it. Concerning the emotional effect of certain sounds, Langstroth observes (page 137) that swarming bees make a singular hissing or whispering that often causes other bees in the apiary to swarm, and this even when unprepared, as they had only miniature queens in their hive. Elsewhere he notes the queen's challenge—a quick, shrill, angry succession of sounds like *peep, peep*, to which one or more of the unhatched queens will respond in a somewhat hoarser key. These piping notes, which may be heard at some little distance from the hive, he regards as almost infallible indications that a second swarm will soon issue; generally the second or third day after, though sometimes as late as the fifth.

For the emotions, it is hardly true that

"Segnius irritant per aures quam per oculos dimituntur,"

although the procession of tin pans in swarming season can make but an apocryphal impression of our musical genius on the apian tympanum. M. Antoine, of Rheims, has refined upon the old plan, as follows: On May 30, 1858, at four P.M., committees of the societies of Acclimatation and Protection of Animals witnessed the experiment on a hive estimated to contain about 30,000 bees. M. Antoine approached this with certain ceremonial incantations which apiarians

will divine, raised it in his arms, turned it round, and set it upside down in the open head of a barrel. Its inhabitants appeared to be quietly collected in the upper part of the hive, except a few at the base of the combs, and none were disposed either to fly or to sting. An empty hive of equal size, set edge to edge upon the first, was raised on one side by a block, so that the passage of the bees could be witnessed. Upon tapping with the hands at the apex of the full hive below, and then upward toward its base, the bees mounted in good order and in close groups. In eight minutes all had left the combs, and were collected in the upper hive. A breath was sufficient to prevent any of them from coming out at the opening left for the spectators.

The transfer was complete, the honey captured; not a bee had perished, or had stung, or had escaped. They allowed themselves to be freely handled by the committee. The mother hive, robbed, was put back near the new one. The working bees sped on the wings of attraction to their melliferous duties, while others, returning laden with the spoils of the garden, field, and forest, alit at either hive, and entered without hesitation either the old or the new dwelling. M. Antoine now explained to us that, after removing the straw apron, he had tapped with his bent finger gently near the top of the hive; then louder and with gradually increased frequency; then with the flat of the hand, and after half a minute with both hands together, leaving the bees no time to recover from their astonishment. Two minutes of this *crescendo* movement having sufficed to obtain their descent, he raised the hive without shock, and struck about twenty more little taps at the top, after which he reversed the hive, with the effect mentioned. His drumming was a gong that sent the bees to dinner, probably. Honey always makes them sweet-tempered; and of all the Gospel, what suits best their religious idiosyncrasy is the parable of the "loaves and fishes." Not *prona, tamen, ventri obedientia*.

The bee may have taught the Egyptian the art of embalming. Should a large, heavy snail intrude within their precincts, and, withdrawn beneath its shell of mail, defy their sting, they glue it down with resin, and it perishes immured. But if its body have been accessible to their stings, then, after killing it, and finding its bulk unmanageable, they plaster it over with layer after layer of that aromatic resin which is found upon the buds of many plants, and which they employ like the essences and aloes of the Thebaid.

In view of such varied and ingenious combinations, who will persist, with Malebranche and the old scholastics, in considering the insect as an automaton, which fatally accomplishes a series of acts predetermined by its

mechanism? These Cartesians, under the pretext of reverence for God and distinction in favor of man, alone made in his image, would belittle the rest of creation to a level in principle with Vaucanson's mechanical flute-player, or with his artificial duck, which ate and digested its food in presence of spectators.

Of bee life the arcanum is the impassioned loyalty of the individual offspring to the ideas of the species and corporate unity incarnate in their queen-mother. These economical laborers, whose virtue is its own reward, spare neither space nor wax in their queen palace cells. They eat up the excess of neuter eggs like sugar-plums, but prepare for the development of numerous queens, as well as male larvæ, destined soon to perish—the queens either by infanticide or else in mortal combat, the duello being in this species an appanage of feminine sovereignty. To the worker larvæ, pittances are stingily doled out. Whine and fuss as they may in their procrustean cradles, their step-sister nurses are inflexible; and when the critical moment for sexual evolution arrives, they are fatally imprisoned in barriers, at once material and organic, that say, "Thus big, no bigger, shalt thou grow."

But let some accident, human or other, remove the queen from her adoring people, they are deeply enough versed in the mysteries of existence to know that, as the sphere, such will be the life that comes to fill it. By privation and confinement they have frustrated for neuters that luxury of passion which permits the finite individual to touch the infinite by the species. Now upon the border of a comb they pile ample materials, and build a royal cell fifty times larger than others. Into this they bear the humble larva from a worker cell, then lavish on it food more succulent and stimulating, under the influence of which its organs of fecundity appear, and it is born a queen. Our friend Toussenet finds the bee and the ant repeat, after the flowers, the lesson of ovarian pre-eminence. The bee-hive is one of the few true republics where productive labor brings prosperity to the working neuters, no farther removed from the estate of true femininity, perhaps, than our own classes of working-women in the field or the factory.

The male in the apian republic is a political myth, and is pensioned for a short term only by connivance with the interests of the species. The wealth and contentment of the hive, which have cost neither blood nor tears to any one outside, attest the high wisdom of a feminine policy; but the term queen, so indiscreetly borrowed from the Old-World royalties of Europe, and which savors of court fuss and feathers, derogates from the honor of maternal creation. The "queen bee" who lays 20,000 eggs this

spring is but the first of her subjects under the constitution of Use and Charm, and those argus body-guards of hers pet, brush, adulate, and feed her—for her eggs. The hive has borrowed several ideas from the Harmonian Phalanx. Both are founded on attractive labor; both exclude idlers and non-producers.

The foresight which characterizes the bee seems, indeed, an especial attribute of maternity much more than of paternity in all creatures. No general wealth without attractive labor, no attractive labor without feminine pre-eminence: behold the formula of the bee!

Is it not well known that if the queen-mother die her republic is overwhelmed with woe and consternation; that labor ceases to attract, and the workshops suspend; that in the prolonged absence of a queen, who in herself is femininity and the species, anarchy succeeds to order, and the demoralized laborers plunder the stores of capital? Males, even males, could not do worse. We can hardly deny the advantageous results of the policy adopted by the honey-bee. Yet the males of all species may well protest against the sorry lot assigned by it to their sex. All the bee males, stigmatized as drones, are destined for the aerial harem of the sultana-mother. Three or four hundred rivals await her caprice, and the first favor granted by this royal coquette to one of her aspirants, besides being mortal to his own person, gives the signal for destroying all the others. When reproached with their indelicate procedure toward these unfortunate helots of love, the worker bees, as pitiless as sexless, reply that the males are accustomed to perish, like our Hindoo wives, when their social mission is fulfilled, and that, familiar with the idea of this sacrifice, they run to meet it, and solicit it from pure ennui and satiety. Our rulers who make war, and the politicians who accredit wars, reason not otherwise about their peoples, born material of cannon-fodder. We do not precisely advocate the philanthropy of stabbing folks to keep them from malingering, not even surplus husbands, who are sometimes so obstinately inclined to live. The lesson which the bee-hive teaches is not personal but economical, it means the *suppression of supernumerary agents in commerce and of parasites on industry*. The bee-hive is a laboratory where order reigns with liberty, equality, and solidarity; where the love of labor is carried to enthusiasm; where the enjoyment of life is made visible and audible, and happiness is proportional to feminine pre-eminence.

If these admirable results have been secured by a few sacrifices, that only shows that insects are not perfect, and that it is difficult to make an omelet without breaking some eggs. These males were unproductive consumers, inapt alike for labor and for bat-

tle, and who formed but an insignificant fraction of the population. Ah, did the men who have ridden women rough-shod, or kept them in the fetters of ignorance and prejudice so many centuries, only justify by their own welfare, as the bees do, their conduct with respect to their mothers and daughters!

The bee is a synonym for industry, and yet, irrespective of the occasional wars of hive on hive for booty, individual bees do notoriously lapse into dishonest habits. Langstroth distinguishes loafing and pilfering bees by their darker and dingier coat. Between hive and hive, as between town and town, or family and family, lie those differences of energy, of health, of morality, and of success, that foot the balance-sheet of the account between free-will and fate.

IN THE HEART OF A HILL.

I.

THERE is in Yorkshire, as most English people are aware, a certain district on its northwestern frontier which is called Craven, signifying the district of rocks. It borders upon the more famous Lake Country, and though it possesses mountains of its own, is somewhat overshadowed and dwarfed by the higher and bolder hills which are the boast of Westmoreland and Cumberland. As if in despair of competing with these neighbors in elevation or grandeur, the hills of Craven have long attracted "the British public" by an exhibition entirely peculiar to themselves, namely, by showing—at prices varying from a penny to half a crown—their insides instead of their outsides. While mountains in general plume themselves on their solidity, those of Craven take a morbid pride in advertising the fact that they are hollow—or perhaps we should more justly say that sometimes by a slight convulsion of nature, by which cracks and cranies are disclosed in their armor of rock, and sometimes by an accidental stroke of the pick of the quarryman, it is discovered that they contain in their stony bosoms undreamed of dwelling-places, caverns, halls, and passages into which has never penetrated the light of day. I say dwelling-places, because the idea that they are intended for such can not fail to strike the visitor as, torch in hand, he follows his guide through their subterranean labyrinths. In some of them, it is true, the passages that connect their stately apartments are so low that one has to stoop, or even go upon all fours; but in others you may wander for hours without having once to bow your head. A carpet of whitish sand, very like the sand and sugar which the grocer sells us as "seconds," is spread alike in corridor and chamber, and glitters in the torch-light as though the floors were strewn

with diamonds; and though no gas is employed, water is laid on in most cases throughout the establishment. A clear and generally shallow stream moves noiselessly along, here broad, here narrow, till it either finds its way into the sunlight, and thereby betrays the secret of the cave's existence, or suddenly leaps down within the cave itself into darkness and chaos.

"We don't know whither it goes, nor how far," says the guide, throwing the gleam of his torch as far as he can upon the dark profound, and bidding us listen to the rush and fall of the vanishing stream: "some thinks as it joins the Lune in Carbrook Dale, and others as it never comes out at all." Compared in extent with such a subterranean wonder as the Mammoth Cave of Kentucky, these Craven caverns are, indeed, insignificant; but they are quite large enough to be lost in—the various passages extending in some cases for miles—while they boast of beauties in stalactite and stalagmite superior to those of their colossal rival. So charmingly beautiful, indeed, are some of these objects, pendent like icicles from the lofty walls, or rising from the floor as thrones or altars, or even in shapes of frosted silver bearing some resemblance to the human form, that the wonder is how such admirable works of nature should so long have been denied to the eye of man. How many centuries—nay, how many eons—until some laborer drove his pick through their rocky casket, have these treasures wasted their wealth unseen by mortal! and how many other store-houses, equally rich, lie still inviolate and undreamed of in the hard heart of these hills! Perhaps the earth and its marvels were not, as we vainly think, made for man alone, and the magic splendors of under-ground Craven may have had, and have, their uses for other beings. Perhaps the king of the gnomes holds court there; or the fairies, vanished from their "dancing rings," where they can no longer disport themselves in privacy on account of the matutinal activity of the followers of the mushroom trade, foot it noiselessly on these inmost sands; or perhaps the ancient gods, rejected by heaven and earth, have withdrawn themselves into these rock-bound recesses to murmur against the new order of things, and the world that has forsaken them. Perhaps this accounts for the strange noises that are heard in lonely spots upon the hills in Craven, gruntings and grumblings underfoot, which the man of science explains by the roar of subterranean streams, but which may, after all, be the curses not loud but deep of discrowned gods—Jove throwing a thunder-bolt in impotent wrath, or Vulcan striking an impatient blow on a stalagmite by way of anvil. For these sounds, curiously enough, are often intermittent; there is an ebb and flow in these under-ground wa-

ters, produced, say the learned, by a sort of natural siphon. Besides these marvels, there are "pots," deep natural wells, rounded as though by the hand of man, but of solid stone, at the bottom of which are running streams; and even "boiling pots," where the dark water rises to the surface and churns over, and then returns to its deep channel to thud and gurgle as before, unseen.

It was, however, none of these natural curiosities which tempted me to Carbrook Dale one spring, but something much better and more attractive—a cordial invitation from an old friend. Frank Lorton had been at college with me ten years ago, and we had met just often enough since in London and elsewhere to keep our friendship green, and allow us to begin our occasional intercourses at the same point as where they last left off; without which opportunities, say what we will, the most constant-hearted of us become new men to each other with the changeful years, and more or less of strangers. Frank had been dependent on a certain wealthy uncle, who used to quarrel with him periodically, and made a new will every six months; but this relative had at last deceased, fortunately during an interval of reconciliation, and left Frank for the first time in his life with a roof of his own—the lord of Lorton Tower. It was a fine mansion in the sense that a plain woman is sometimes called fine, being of stately aspect, round, and of considerable extent; but its architectural features were simple to plainness, and but for the ivy which threw over them its graceful veil, would have been downright ugly. In its youth, however, it must have had attractions, since it had been laid siege to both by Roundhead and Royalist, and bore marks of the delicate attentions of both parties in the shape of shot-marks and cracked masonry.

If Frank was not very well suited to be a feudallord in all respects—he was no sportsman, and his views were Darwinian super-scientific—he had the feudal virtue of hospitality, and made his guest thoroughly comfortable. It was early spring, which is an inclement time in Craven, but the heaped-up hearths kept the cold out of the old Tower, and the wassail-bowl was pushed merrily round in the tapering shape of *Clicquot*. Though a bachelor at present, Frank had been given to understand that, now he had become "landed," it would be necessary to choose a wife out of one of the county families in the neighborhood, but in the mean time he enjoyed his liberty, and was content to discuss the origin of species over a cigar. He was scientific, as I have said, in a wild sort of way, and liked nothing better than to wander over those curious Craven hills, and theorize about their hidden marvels; and I was glad to accompany him in his walks, though I did not go very far with him toward his conclusions. It was not the

time of year when the general public is admitted into the recesses of the hills: from June to September only, when the excursion trains are running, the great caverns throughout the district are lit up for the reception of visitors: but Frank had sufficient influence to unlock them for us, and we saw most of what was to be seen in the recesses of Carr and Ingleborough, though in a somewhat imperfect fashion. Carr is a hill, of course—Carbrook being the name of the town at its foot, and Carbrook Dale of the district immediately about it—and a very fine hill, but as bare as a billiard ball in the matter of foliage, and, indeed, of verdure. It towers over the village which is called after its name in almost perpendicular terraces of limestone, resembling solid masonry, and it is there that admission to its subterranean wonders is obtained. From Lorton, on the other hand, it rises by a gradual slope, and many a windy walk had Frank and I to its bald brow. Upon one occasion, just as we neared a certain rowan-tree in full flower, the only arboreal ornament in sight, he held up his hand for silence. "We are five hundred feet from the heart of the hill," said he, "and two miles from the nearest open stream, and yet I hear running water." I listened, and heard it too, though, unless he had told me what it was, I should not have recognized the sound. To my ear it was like the gasps of some strong men in the agonies of suffocation, and I said so.

"The stream is intermittent," he explained, "and its voice comes up to us through a vast speaking-trumpet. I have brought this with me"—and he pulled from his pocket an immense ball of twine—"to show you from what a depth it comes to us." He tied one end of the string to the rowan-tree, and picking up a large dark stone, which happened to have a perforation in it, attached that to the other end. "Now," said he, pointing to a crack in the ground so small that it had escaped my notice, "there can be no deception on my part: heave the lead for yourself." I put the stone into the crack, and it dropped at once, carrying the line with it, on and on and on, until the whole length was run out.

"Why, the hill is hollow!" cried I.

"A good deal of it is," returned he. "It would take us a good three miles to get down to where that stone now lies in the great Banquet Hall, as they call it, under Carr." I had been with him there last week, and remembered it, of course, quite well. Where we were standing then, the hill was in truth quite hollow.

"That was where the iguanodon was found," said Frank, "proving that these hills existed, and were the habitations of that class of reptile, before the great diluvial deposit—what the vulgar call the Flood."

Frank was very ready with his diluvial

deposits, his "upheavals," and his "traces of the action of fire," and in general looked very wise and grave while he was talking about them; but on this particular occasion I caught a twinkle at the corners of his mouth, which emboldened me to remark that I didn't believe a syllable about the finding of that iguanodon.

"And quite right, too," said he, coolly; "but it was a capital story, and took in a great many good people who thought themselves sagacious. That the beast was found there, and alive, was true enough; but he had not been there for twenty thousand years, nor for twenty minutes. The fact is, that the geological people came to such positive conclusions about old Carr and his inside, that our doctor in the village, who happened to be a practical joker, grew quite zealous for the honor of his native hill, and resolved to puzzle them a little. Having visited by chance a traveling menagerie at Lancaster, which boasted among its other curiosities of a great lizard, he made overtures for its purchase, and the beast being very ill, and its proprietor in want of funds, he obtained possession of it for a small sum. The chief difficulty he had to encounter was the bringing it to Carbrook without observation, but that he also accomplished by swathing it in flannel, and affecting to treat it as an invalid gentleman come to stay with him in the bracing airs of Craven for his health, and whose humor it was to travel by night. Before morning, and with the connivance of the men who lit up the caverns, he had had the creature conveyed into the hill where the excursionists found him the next day *in situ*—as there were a hundred witnesses to prove. Nothing ever made such a sensation hereabouts since the great diluvial deposit. The local geologists were at daggers drawn over the iguanodon, which the doctor stoutly maintained it was. The rocks of Carr, it was thus proved, he said, were Wealden Bed, which was about equivalent to the declaration that Yorkshire is Sussex, because oysters are found in avia-ries. But it took the people in. The mere exhibition of the unexpected saurian at sixpence a head procured two hundred pounds, which this practical joker afterward handed over to the vicar (who believed in the beast, and has not forgiven him for the deception yet) toward the restoration of the old church, while our county dinner-tables were supplied with a topic for conversation for half the summer. He never took me in, and therefore I thoroughly appreciate his stroke of humor, but the ungrateful county (including the local newspapers, who were most indebted to him of all) has looked askance at the good doctor ever since. That benefactor of his species has lost his practice by the affair altogether, except that he got patients out of the excursionists, some

of whom were frightened into fits by coming upon the iguanodon in his lair."

We laughed over this story a good deal, and returned homeward, forgetting all about the twine, which it seemed was of some particular sort used in gardening, as I heard Frank tell his groom to send a boy on the Monday to recover it. The day this happened was the Saturday before Easter-Sunday—a date which, in connection with that twine, I shall not forget to my dying day.

II.

On the Sunday at breakfast-time the letter-bag brought certain business tidings to my host which necessitated his immediate presence for a few hours in London, and off he started the next morning, with many apologies for thus deserting me. "You will manage to amuse yourself somehow, I hope," said he; "and if you take my advice you will take a stout rod, and Peter will show you where to try your luck in Lune." The day was calm and windless, though without much sunshine, and, though the time was early for fishing, seemed to promise sport; so I took my rod and basket to the river. It being Easter-Monday, and a general holiday, I did not trouble Peter (the keeper) to accompany me—an act of unselfishness which I had afterward bitter cause to rue. No sooner had I commenced operations than the sun came out with intense vigor, and, whether from that circumstance or through my own unskillfulness, I never saw a fin. After about an hour of fruitless endeavor I became weary of throwing a fly into space, and turned my attention to other matters. I observed that the country lanes, beside which the course of the stream took me, were thickly thronged with people, and inquired of a cottager whither they were all going. His reply, which was couched in the Craven dialect, was not very intelligible, but I gleaned that there were some great doings in Carbrook which were attracting thither the local world and his wife—principally, as I noticed, in hay-carts without springs, and with the shafts tilted higher than I should have liked to see them in any vehicle used for my own riding. But they were hearty, merry folks, full of song and laughter, and in my loneliness I envied then their good companionship, and perhaps regarded them with somewhat wistful looks. At all events, as I sat on a gate taking my rod to pieces preparatory to returning home, I was hailed by a passing farmer with, "Not much sport, I am afraid, master;" and when I shook my head, he replied, "Why don't ye gi' it up, then, and come wi' us to the caves? there's plenty of room on the other side of my old woman."

I don't think he had the least expectation of my accepting his offer, for he laughed while he made it, as did his good dame also;

but when I said, "Well, I'll come if you'll have me," he pulled up his horse at once (having already passed the gate), and said, "That's right," quite cheerily. So up I got into the cart, the increased weight making the shafts fly up, as though in amazement at my audacity, till they were almost as perpendicular as shafts in mines. "You're a stranger here, I reckon, mister?" said he. And when I told him that I was—without a word of my being a guest at the Tower, lest that fact should have turned his genuine hospitality into a desire to ingratiate himself with a friend of the lord of Lorton—he became my cicerone at once, pointing out this and that remarkable object that presented itself, and dwelling upon the towering mass of distant Ingleborough with a Yorkshire dalesman's pride. "And he's as fine within as without," said he; "and so is Carr, for that matter, when he's properly lit up, as he will be to-day."

Then I learned for the first time that Easter-Monday was one of those days upon which the caverns at Carbrook were illuminated, and more than ever congratulated myself that I had accepted the invitation of my jovial friend. The opportunity, he said, would not occur again till Whit-Monday, after which the excursions began, and the illuminations were pretty frequent. I had only seen the caverns of Carr in company of my friend and a couple of guides, with a corresponding number of torches, and Frank himself had told me how infinitely finer was the spectacle when lights were arranged along the rocky walls from end to end. We arrived at the village just as the holiday train came laboring in with its thousands from Preston, Crewe, and other manufacturing towns—a merry company of all ages and both sexes, but composed for the most part of young men and women.

"If you had rather gang with the lassies, as is only natural," said the farmer, good-naturedly, "than bide along wi' us old folks, my missis and I shall not be offended."

His dame, however, very properly rebuked him for this sentiment, as not only blameworthy in itself, but inapplicable to a young gentleman of my social position; and I, for my part, laughingly asserted that nothing should part old friends. Having left my rod and basket at the inn where our horse was stabled, we three repaired, therefore, to the mouth of the cavern, to which all were directing their steps. It was approached by a picturesque path cut in the side of a ravine, down which a mountain beck leaped and sparkled; and at the end were iron gates, through which the public left the sunlight and passed one by one, after paying sixpence a head to the janitor, into the heart of the hill. There was a great crush, and though I did my best to keep with them, I here lost my kind companions, and was carried in with

the stream. The chief difficulties of the subterranean way were to be met with at first. The passage was low-roofed and narrow; one side of it was in the occupation of a shallow stream, and there were slippery rocks to climb, which needed caution, though all was made light enough on the present occasion by innumerable candles—warranted, as a printed notice informed us, to burn for two hours only. The limited time thus placed at our disposal made every body anxious to push on, and there were scores of cries from as many young ladies that they were “in want of a hand;” meaning not that they were mutilated, of course, but that they needed the assistance of their respective young gentlemen to help them over the rocks. There were two neatly dressed and modest-looking girls I noticed who, evidently unused to such rough clambering, were unprovided with a cavalier; and to these, as in duty bound, I proffered my aid. They were frank and communicative, and did not hesitate to let me know, in spite of my politeness, that they would have gladly dispensed with it in favor of the company of a certain “Jack” and “Fred,” who had arranged to join them at a station on the railroad, but had been prevented doing so from the extreme fullness of the train. It was so *very* provoking, they said, and it must seem so strange to *me* to see them without an escort. I begged them to dismiss that latter idea from their minds, and did my best to make up for the absence of their legitimate protectors. Let not the uncharitable misconstrue my actions, and still less theirs. They were “engaged young persons” to Jack and Fred, as I was given to understand by the remark that those were “young men as they walked with;” and besides (though, it is true, I must have married rather early in life to have accomplished it), I was old enough to have been their papa. Finally (if there are still carpers), it must be admitted that I could not possibly make love to two young ladies at the same time. But I could not help laughing to myself at the notion of my having the *rôle* of cavalier thus thrust upon me, and looking up nervously now and then when a stout man pushed past me, lest it should happen to be my friend the farmer, who would, without doubt, have rallied me upon the responsibility I had so gallantly undertaken. As for my fair companions, they were full of innocent mirth, and enjoyed with childish delight the extraordinary wonders of the subterranean palace. I explained to them that when mortals were absent it was the abode of the king of the fairies; pointed out his throne in the hall of audience; the very elegant chandelier that sparkled in the queen’s boudoir; and the pipes of the princess’s organ—a row of stalactites—which, when struck by sticks and umbrellas, as they very often were,

emitted such silver sounds. They listened greedily, half crediting what they heard, and only once, when I pointed out to them the picture of the heir-apparent (an arrangement of stalactites somewhat resembling a picture-frame) as a striking likeness of the crown prince of Fairy-land, did they break into open rebellion and disrespect. I told them also of the iguanodon, seventy feet long or so, of which they had read a still more protracted account in the local newspapers, and showed them the exact spot where its head and shoulders had been found in the audience-chamber, while its hind-legs and tail filled up the great gallery. It was like telling stories of Prince Percinet or the Princess All-Fair to an admiring nursery audience, and, for my part, I enjoyed it exceedingly. I suppose the pleasure was mutual, for my fair friends were equally astonished with myself when a cry of “All out!” was raised, and the people began to turn back toward the entrance. My watch, however, told me that there was still some time to spare, and we had not yet seen that curious spectacle called the Caldron, about which my companions had heard more wondrous tales than any thing I had told them. We pushed our way, therefore, through the retreating crowd in the direction in which, from what I remembered of my previous visit to the spot, it lay; and presently, at the end of one of the western passages branching from the Central Hall, we found it. There was not much to see, but what there was suggested weird and uncanny thoughts. The roof sloped down, and the walls narrowed to a sort of arch, through which a stream of considerable depth and volume leaped down into pitch darkness. The roar of the fall was very great, and any substance which was dropped into the water was whirled away at once, no man knew whither, and was never seen again. A venturesome guide had on one occasion attached himself to a rope, and been lowered down into the abyss below. He was a good swimmer, and had contrived to keep the torch alight that he had carried in his cap; it had been seen for many yards, but was presently extinguished; and when the rope was drawn in by those above, it brought in the too reckless adventurer senseless and almost drowned. His torch had been put out, it seemed, not by the water, but by striking against the roof of the cavern, between which and the stream there was no longer any space. It was no wonder that the simple creed of the villagers held that that sullen flood roared unchecked on to Hades. This view was shared by my companions, but combated by me. I felt it my duty to warn them against all marvelous tales that I did not tell them myself, and explained to them that, in all probability, this river found its way by some undiscovered issue into the river Lune.

"Why, Jack lives on Lune," said one (her name was Lucy), quite beaming at the very thought of such a coincidence. "How little he thinks—and, for the matter of that, Ruth, no more does Fred—of where you and I are now standing!"

"Let us send him a line and tell him," said I, laughing; and I pulled out pencil and paper, and wrote a few absurd words at Lucy's dictation, addressed them to his lodgings, and dropped the billet-doux into the stream. I had found some difficulty in concluding this dispatch, by reason of the waning light, but not until it was sent off did it seriously strike me that the lights in the cavern were waning. On looking round, however, I saw that the candles on the walls had burned very low, and that there was no time to be lost in making our exit. Off we started, therefore—my companions being a little frightened—at a round pace, which would without doubt have brought us to the gates in a few minutes, for they were scarcely more than three hundred yards away as the crow flies. But the crow has no opportunity of flying in the subterranean passages of Carr, which are not straight, but very tortuous; and upon leaving the Central Hall, from inadvertence on my part, and perhaps from some little flurry of mind, we unfortunately took a wrong turn. It was not long, indeed, before we found out our mistake and hurried back, but by the time we had reached the Hall again the candles were all but out—mere sparks from the walls—while those in the passages, which were by their position more exposed to draughts, were already extinguished. We would have attempted them even now, but the Caldron was not the only abyss that yawned in Carr: half a dozen times on our way in had we been warned by placards, as well as by the voices of the guides, of a peril on the right hand or the left; and how would it be possible to avoid them *now*, in the utter darkness and silence which had succeeded all that glitter and noise? It was that sudden change, I think, that appalled us almost as much as our situation itself. But a few minutes ago we had been the merriest of a merry crowd in a scene of dazzling splendor; and now, alas! we were shut out from every fellow-creature, perhaps forever, in the dark and silent heart of a hill!

The first impulse of my unhappy companions was to accuse the guide, to whose impatience and inattention to their charges our misfortune seemed to be owing; but I was obliged to confess to myself that we had brought it upon our own heads, since again and again the cry of "All out!" had been raised, and the few guides that there were among so many in need of guidance could hardly be expected to give an individual warning to each person. Moreover, it might very well have happened that a

guide might have come back to the Central Hall while we were engaged at the Caldron, and, seeing all clear, might have imagined that the excursionists had departed, to the last man. If we had followed the directions that were laid down for the public, we should have visited the Caldron in the first place; but I had taken upon myself the task of guide, upon the strength of my brief previous acquaintance with the place, and varied the programme, as I already began to fear, to our destruction. If Lucy had not wasted our time by causing me to write that silly letter to her lover, all, indeed, might now have been well, but I felt that I had no right to blame a foolish girl for the indulgence of a whim that I might easily have refused to gratify, and reproached myself again and again with the consequences of my vanity and rashness. The poor girls sat sobbing and wailing in the darkness beside me, and though every moan went to my heart, I did not attempt to stop them, but added to their clamor by shouting for help at the top of my voice. There was still a faint hope that the guide who closed the gates might hear our cries, even if he did not return on his own account to satisfy his mind that no one had been left behind. No such good fortune, however, befell our little party; Ruth fancied she heard the far-off clang of the iron gates, and, if so, that was all the sound that now reached us, save the murmur of the stream beside us on its way to Lune or Hades.

III.

"How long do you think we shall have to remain here, Sir?" asked the girl that was called Lucy, presently, in a fretful voice. It was plain that she was thinking of the inconvenience of our situation rather than of its peril; and I hastened to reply as cheerfully as I could, while at the same time sounding her as to what chance of relief might lie in the anxieties of her own friends.

"Perhaps to-night," said I, "perhaps not till to-morrow morning. If the gate-keeper gets much ale given to him by the holiday-makers he may sleep late, and we shall be kept prisoners even longer. But I should hope some of your own people would miss you before then, and come to seek us."

"They won't do that," returned the girl, sadly. "Ruth and I live in lodgings alone together, and are quite independent of our friends, except that we dine with them on Sundays."

"But you will be missed at work—in the manufactory where you tell me you are engaged together, surely?"

"Oh no, Sir: or at least not till Wednesday; for Tuesday is kept a holiday, like to-day. And even then there would be no fuss made; we should be only fined for absence, and we all the time starving to death, perhaps. Oh dear! oh dear!"

Lucy was rather older than her companion, but much more child-like and demonstrative in her manners, and I thought to myself I must never tell this one the whole truth about our position, or the poor child will take leave of her senses altogether—for the words of the old farmer concerning the times of opening the cave were ringing in my ears like a knell. Not till six weeks hence—upon Whit-Monday—he had said, would there be another illumination, and unless the very unlikely chance of an early tourist coming to Carbrook and hiring a guide or two with torches, on his own account, as Frank and I had done, should occur, long before that time we should have all died a miserable death. The probabilities of our release were, I was compelled to confess to myself, very slender indeed, and depended, it seemed, wholly upon the measures that my host of Lorton Tower might take for my discovery. He was to return by the night mail, and would be at home in the early morning, when for the first time he would hear of my disappearance. I endeavored to put myself in his place, and consider what I should do in such a case if our positions were reversed. I had been last seen on the banks of Lune, and thither his attention would be at once directed. They would probably drag that portion of the river—an operation which must needs consume much precious time. If the farmer who had invited me into his vehicle should hear of the event, all might yet be well; but, for any thing I knew to the contrary, his house might be at a great distance, and even bad news travels in the country at no great speed. As to Frank's entertaining the idea that I had visited Carbrook, I felt that that chance was hopeless. An Easter-Monday mob of factory hands, he would say to himself, was the last thing likely to attract a man who had come from London for quiet, and whose day had gone by (he was sure to say *that*, confound him!) for the enjoyment of village junketings. No, he would as soon think of finding me locked up in the vaults of Lorton church as in the caves of Carr—which, moreover, as I had already visited them in his own company, might well be supposed to have lost all attraction for me. Nor was there, as it seemed, any hope to be placed in the exertions of the friends of my fellow-prisoners. I understood now for the first time that, among the other disadvantages of poverty, there is this one of being left entirely to ourselves; for if these poor girls had been young ladies, they would have been missed by servants, friends, or relatives within a few hours, and a hue and cry have been raised for them; whereas, until the time came round for their Sunday dinner at home, nobody would ask a word about poor Ruth and Lucy. Upon the whole, the best chance of our discovery seemed to me

to lie in the fact that I had left my rod and basket at the inn; for if the landlord had heard of the Lune being dragged for a lost fisherman, he would surely be able to couple the two circumstances together, and arrive at the right conclusion. But I remembered that the inn was very full, and its proprietor exceedingly busy, and that he had put the articles in question hastily away into a cupboard, where they might lie for days, or even weeks, forgotten. A few days in our vast prison-house would probably suffice to kill us all; and frightful as was this reflection, I remember it was accompanied by the grimly humorous idea that the doctor who was a practical joker might make capital out of our bones, as he had out of the iguanodon—by asserting them to be the relics of Pre-adamite Man.

"Don't cry," said I to Lucy, cheerfully; for the poor girl was almost in hysterics. "You should take courage from the conduct of your friend. *You* are not crying, are you, Ruth?"

"No, Sir," was the quiet reply, given in a very low voice; "but I am frightened at the darkness and the silence, and I— Dear heart! what's that?"

A dull, metallic sound had fallen upon her ear, which, while it evoked a scream from both my companions, filled my own heart with gratitude and gladness. In stooping down (for I was on my legs, though my companions were seated) to catch Ruth's words the pocket of my shooting jacket had come in contact with the wall, and the concussion thereby reminded me for the first time of my possession of a luncheon box, which the housekeeper of Lorton Tower had hospitably filled with sandwiches that morning before I started for the river.

"Come," said I, joyfully, "we shall not die of starvation—at present, at all events;" and I told them what I had found.

"Thank God for that!" said Ruth, simply. "There is plenty of water, too, is there not, Sir? and the air is warm here, and the sand dry. I remember Fred lent me a book, called 'Robinson Crusoe,' where the man is cast on a desert island, and yet finds cause to be thankful that things were no worse; and he was taken off and came home in the end all safe. So let us submit ourselves to Heaven's will also, and be grateful, and hope for the best."

"You are a good girl," said I, admiringly, "and you shall yet make a good wife to Fred, my lass; and Lucy, too," added I, gayly, "shall make Jack happy. I wonder whether he has got her letter yet that went by the water post?" My tone, and this reference to her lover, somewhat raised Lucy's drooping spirits. "Ah, if Jack could only know," cried she, "he would dig through the mountain with his hands. I can't think we shall be forgotten and left to perish."

Here's a Good-Friday bun, by-the-bye, which I saved up to divide with Jack because it has sugar on the top; and either Ruth or I have also a few gingerbread-nuts."

"Take them all into your keeping, Sir," said Ruth, putting these delicacies into my hands; "for we don't know how long we may have to stay here, and it may be necessary for us to be allowed like shipwrecked persons. You are wiser and more prudent than us, who, if we feel hungry, may eat all we have, perhaps, at one meal."

This trustfulness touched me exceedingly, though, indeed, I suppose hardly any man could have been such a monster as not to have shared every meal to the last crumb with such helpless fellow-prisoners. Our relations with one another seemed to be completely changed. I had amused myself hitherto by playing upon their simple credulity, and treating them as playthings of the hour; I now felt as though they had been orphaned children confided to my charge in solemn trust. Joking and high spirits, of course, were to be expected in them no longer; but I noticed on their parts that they dropped the familiarity that they had originally used in speaking to me, and addressed me as a guardian or protector. Besides my luncheon case I had a brandy flask, a little of the contents of which I persuaded them to take, mixed with water; for I justly deemed that scarce at any time could they more need support than when suffering from the first stroke of such a calamity as had befallen us. The air of the Central Hall, in which we were, was, as Ruth had said, both pure and warm, and its floor was soft and dry; but what distressed us all exceedingly was the pitch darkness. The eye, it is said, soon gets accustomed to the dark; but that is only the case with reference to gloom: where there is no light at all the eye has no service to perform, but roams about in distressing impotence, only to meet blackness that seems a solid wall, and opposes movement. I had, unhappily, no wax-matches with me, but I had some cigar-lights, one of which I struck, and lit by means of it the piece of newspaper which had held the gingerbread; by help of this, rolled up in the shape of a torch, I contrived to secure one or two bits of candle-end from the wall, but they had burned out almost to the last, and could not be carried for an instant. They enabled us, however, to gain some notion of our present position, and to make our arrangements for the future.

We were on the north side of the vast Hall—the one next to Carbrook, and close to the stream, one arm of which led to the Caldron, and the other toward the exit from the caves; without doubt we could have contrived to follow the course of this latter, but it would have been most dangerous so to do, both on account of the abysses of which I

have spoken, and of the depth in places of the stream itself; moreover, if even we escaped these perils, this water guide would fail us long before we reached the gates, and leave us in a situation far less convenient than that in which we were at present situated. Indeed, if I had wished to move our quarters, I could scarcely have persuaded Lucy, at all events, to put one foot before the other in that dense obscurity which shut us in on all sides.

When we had been many hours in this dreadful place—hours that seemed so long that I could scarcely believe my trusty repeater when it struck them—I proposed that we should divide the cross-bun by way of supper (it was no longer hot, but exceedingly stale, and yet it was one of the sweetest morsels I ever tasted), and then try and get some sleep.

I made my own couch on the opposite side of the Hall, though within easy hearing, for the human voice sounded loud and clear in that stately place as I have never heard it elsewhere; but though the murmur of the stream sang lullaby beside me, I could not sleep nor close my eyes.

There is little, as may be imagined, to be narrated of our life in that lightless prison. Every day, which, alas! was also night, found us weaker and more dispirited; and when Wednesday drew to its tedious close we had only one sandwich left and a few drops of brandy. Lucy, worn out with fretting and exhaustion, often fell into a deep sleep; but Ruth, like myself, was feverishly wakeful. When our companion thus forgot her cares we spoke together quite openly of our position. Hope was almost dead within us by this time, and yet this courageous girl spoke as calmly as though she were chatting over her pillow lace—for that, as I had learned, was the occupation of my companions when at home. They had told me every thing about themselves and their affairs, and I had been equally confidential to them. What did it matter? In a few hours we should be transferred from this living tomb to another world, and in the mean while such talk helped to pass the weary hours. Of late, however, probably through weakness, the girls had grown more silent, though in the solemn stillness of night I often heard them recommending themselves to the protection of Heaven, and entreating deliverance for us all.

On one occasion Ruth addressed me, while Lucy slept, in her usual quiet tone, but with something more than its ordinary seriousness.

"There is now but little hope for any of us, Sir: of that I am well aware: but there is more hope for you than for us, because you are a man, and stronger. In books that Fred has lent me, about disasters at sea or in travel, it is the women who always give in

first, even where the men have stood loyally by them, as you have done by us, and more. God bless you for it! If"—here her poor, weak voice began to tremble—"if I should chance to see Fred no more, and your life should be spared, Sir, I beg of you to tell him that I thought of him continually while in this dreadful place, and that my last message to him was not to fret. He deserves a good wife, and I would have striven to have made him one; but there are plenty better than me, and I hope he may find one to make him happy. Of course he'd have taken up with somebody else in time, Sir; but I don't wish to make him unhappy about that on my account."

"For Heaven's sake, don't unman me, Ruth, by talking like this!" said I; and a shudder ran through me as I spoke, at the idea of being left in that living grave alone, with my two companions dead beside me. "I thought you were much too sensible to give way to hopelessness of this sort."

"I am not hopeless, Sir," said she; "but what little sense I had I fear is going. It may be merely weakness, but it also may be the beginning of the end, and that is why I have told you about Fred."

"What makes you think your wits are going, my good girl?" said I, for I had more than once during the last twelve hours felt queer and light-headed myself, and I was anxious to hear whether her symptoms had been similar to my own.

"Well, Sir, my head has been bad since yesterday; I seem to hear the noise of a bigger river than what runs through this cave; and sometimes I seem to be at home with father and mother, and sometimes I am walking with Fred; and I begin to see light at all times where there is no light."

"Where do you see light, Ruth?"

"There, Sir, there." She pointed with her arm, I suppose, but of course I could not see that.

"In what direction, Ruth? Not toward the Caldron, surely?" A faint hope began to dawn on me that there might be some undreamed-of outlet in that direction which the intense darkness had revealed for the first time.

"No, Sir; in the opposite direction. I see it now up in the roof yonder like a star in the black sky."

Then I thought that the poor girl's brain was, indeed, failing, for I could see nothing; but I rose and walked feebly toward where I imagined the spot she indicated to be, and presently, to my wonder and delight, a little speck of white appeared to *my* eyes also. There was no reason for much joy, except that it *was* light, since it came from the corner of the high roof of the great Hall, hundreds of feet above our heads, and as unattainable to us as that to which Ruth had likened it—a star. It must have been shin-

ing there every day during our imprisonment, though her sharp eyes, long accustomed to the gloom, had been the first to discover it; and yet, in my distress and despair, it seemed somehow to be a messenger of hope. That it was a cranny in the mountain roof was clear; though in what portion of the hill it might show itself I had no means of judging. Perhaps some shepherd boy was even now passing by it, little thinking of the poor wretches that were imprisoned beneath him, and taking the fresh air and sunshine as gifts of Nature not worth thanking her for, since they were never denied to any body. If I had even seen his shadow cross the chink, however, it would have availed us nothing, for he could scarcely have heard our cries for aid; and had he done so, would in all probability have set them down among the weird and unmeaning noises sent forth so often from the recesses of Carr. As I reflected thus my foot struck against a stone. Now to one who has been dwelling on sand a stone is almost as great a rarity as light to one who has been pent up in darkness, and I instantly stooped down to pick it up. Then I uttered a shrill cry, which startled my two companions, and made them cry out also in vague terror. The stone I held in my hand had a string tied round it, and I felt certain that it was the same which I had let down from the hole in the hill on Saturday, and that the other end of the string was tied fast to the rowan-tree on the top of Carr.

I lit one of my remaining cigar-lights and found this to be the case, for the black stone he had used to plumb with was easily recognizable. And now we had some connection, however frail, with the world without, if we could only use it to some purpose, and *in time*. If we had made this discovery at first, I should have felt that our deliverance was secure; but my companions had grown already very weak, and a few hours more must needs decide their fate; and if *they* died, it seemed impossible to me that I should survive them. There was not a moment, therefore, to be lost. I bade them change their place to one almost immediately beneath the cranny; and then we all took turns to pull gently but firmly at the string, exactly as though we were ringing a bell. The effect of this would be, of course, to shake the rowan-tree, which, all in blossom as it was, and standing quite alone, was a most noticeable object to any person upon the fell. My hope was that the same calm weather might still hold which had prevailed on that fatal Monday that seemed now so long ago, so that the swaying of the tree might not be attributed to natural causes; and even if it should be stormy, there was still a chance of the groom sending the messenger for the twine, as his master had directed him to do in my hearing. As it happened, this latter circum-

stance did not occur, on account of all hands at the Tower being employed in looking for me in the wrong direction; but I had cause to bless that dilatoriness which so often accompanies the execution of orders given in the country, since, if the boy had brought that twine home *on the Monday*, we three poor prisoners of the Giant Carr would never have escaped from him alive. That very evening, however, a shepherd chanced to cross the fell, and was attracted by our signal. Never shall I forget the delirious joy of that moment when we heard him hail us—though we could not catch his words—or the eager cry for help that seemed to well up from our very heart in response. I instantly issued our last ration of sandwiches, and was about to divide the brandy between my two companions, when Ruth whispered that I should give it all to Lucy; and it was fortunate that I did so, for else I scarcely think the poor girl could have survived the suspense that followed. From the accidental absence of the guide who had the charge of the caverns, the key could not be found, and the iron gates had to be forced ere we could be released. It was past midnight before we heard the shouts of our deliverers,

and beheld the flashes of their torches cleave the hateful gloom.

The experience of those three days' lodging in the heart of Carr was a profoundly serious one; but it has borne very pleasant fruit. Besides Lorton Tower there are now two other roof-trees near to Lune where I always find a welcome—the cottages of Jack and Fred, who married their respective sweethearts within a few months of their rescue. I was present at the double wedding, and had the duty of godfather in duplicate conferred upon me the ensuing year. Lucy has got the most sensible husband, and Ruth the handsomest; but the latter has got sense enough for both. When romantic people ask me whether I have ever met with a heroine in real life, I tell them "Yes." For Ruth had not only the heroism to look Death in the face, but the greater courage to contemplate the fact that her handsome lover would assuredly console himself for her loss by marrying somebody else. "Lor', and so I should ha' done," said Fred, with a grin (he is himself not a romantic person), when I revealed to him what Ruth had said: "a man's heart ain't stone, you know, like the heart of a hill."

LAST DAYS.

As one who follows a departing friend,
 Destined to cross the great, dividing sea,
 I watch and follow these departing days,
 That go so grandly, lifting up their crowns
 Still regal, though their victor Autumn comes.
 Gifts they bestow, which I accept, return,
 As gifts exchanged between a loving pair,
 Who may possess them as memorials
 Of pleasures ended by the shadow—Death.
 What matter which shall vanish hence, if both
 Are transitory—me, and these bright hours—
 And of the future ignorant alike?
 From all our social thralls I would be free.
 Let care go down the wind—as hounds afar,
 Within their kennels baying unseen foes,
 Give to calm sleepers only calmer dreams.
 Here will I rest alone: the morning mist
 Conceals no form but mine; the evening dew
 Freshens but faded flowers and my worn face.
 When the noon basks among the wooded hills
 I too will bask, as silent as the air
 So thick with sun-motes, dyed like yellow gold,
 Or colored purple like an unplucked plum.
 The Thrush, now lonesome—for her young have flown—
 May flutter her brown wings across my path;
 And creatures of the sod with brilliant eyes
 May leap beside me, and familiar grow.
 The moon shall rise among her floating clouds—
 Black, vaporous fans, and crinkled globes of pearl—
 And her sweet silver light be given to me.
 To watch and follow these departing days
 Must be my choice; and let me mated be
 With Solitude; and memory and hope
 Unite to give me faith that nothing dies;
 To show me always, what I pray to know,
 That man alone may speak the word—*Farewell.*

Editor's Easy Chair.

SO great a calamity as that which has befallen Chicago will become historical, like that of the burning of London and of Rome. The difference is that it was a disaster simultaneously known to the whole country, and, indeed, to the whole world. On those sad October days, even while the fire was devouring the great city of the West, every community in the land was thrilling with sympathy. The telegraph has made us all of one nerve; and no one can suffer without all suffering. It enables succor to be more instant, but it breeds panic. While Chicago burns New York trembles, and the tragedy of the West paralyzes the rest of the country. The relief from this universality of suffering was the compensation of the imperfect methods of communication in the older time. England learned gradually of the burning of London. The catastrophe was ended when it was known. But with us there was the same suspense every where that there was in Chicago, and a thousand miles away every body asked, with sorrow, "What is the last account?" as they did in the streets of the stricken city.

With the telegraph the country has but a single consciousness. In his day, nearly two centuries ago, Daniel Defoe thought that every thing was known at once; but what would Daniel Defoe say to a city newspaper of to-day? "It was about the beginning of September, 1664," he says in his history of the Plague in London, "that I, among the rest of my neighbors, heard, in ordinary discourse, that the Plague was returned again in Holland: for it had been very violent there, and particularly at Amsterdam and Rotterdam, in the year 1663, whither, they say, it was brought, some said from Italy, others from the Levant, among some goods which were brought home by their Turkey fleet; others said it was brought from Candia; others from Cyprus. It mattered not from whence it came, but all agreed it was come into Holland again. We had no such things as printed newspapers in those days to spread rumors and reports of things, and to improve them by the invention of men, as I have lived to see practiced since. But such things as those were gathered from the letters of merchants and others who corresponded abroad, and from them was handed about by word of mouth only, so that things did not spread instantly over the whole nation as they do now."

These last words seem to have no meaning, when they are spoken of England nearly two centuries ago. The calamity to which they refer was followed in less than two years by a fire which lasted for four days, destroying four hundred streets and thousands of houses, and sending two hundred thousand of the inhabitants to encamp in the open fields. But the commercial relations of a city like Chicago with the rest of the world are so different from those of London two centuries ago, that the catastrophe of such a fire is infinitely greater now than it could have been then. And if the disaster is so much greater, so much the more imposing and beautiful is the spectacle of immediate and universal sympathy. Indeed, that is the purest consolation of so vast a calamity. While the fiery tempest was yet furiously raging in Chicago, and hundreds

of thousands of persons were flying from their homes for life; while the princes of the morning became paupers at evening; while the noble buildings of every kind of honorable industry were flaming and falling, and the famous city seemed to be swiftly crumbling into chaos—all over the land, while all the people shared the sorrow, they met in cities and towns and villages, and organized and swiftly forwarded relief. This is a shining fact, which no history of such an event in former times furnishes, and which will be the most cheering and inspiring of all in the annals of the Chicago fire. The loss to other cities seemed immeasurable; no great commercial fortune or house could be quite sure of its steadfastness; but all that was considered was the exposed and starving population of the smitten city, and a full hand of bounty from the whole country and from Europe was stretched eagerly out to accompany the voice of sorrowful sympathy.

As we write, the details of the catastrophe are unknown and the losses incalculable. But these few words shall be the certificate to those who read these pages hereafter that while the great fire of Chicago was a calamity unspeakable, and a terrible blow to the reviving prosperity of the country after the war, yet it revealed such humanity and generosity and sympathy that every one was prouder of his country and his kind. The spirit and sagacity that built the famous city will rebuild it. It will rise from its ashes greater than before. But neither that city nor the country will ever forget that it was a common sorrow, a common loss, and that the manner in which it was met and mastered was a common pride of Americans.

FIFTY years ago the man who should have proposed to build a road under the Alps would have been thought a more hopeless lunatic than he who should have declared his purpose of flying over them. But Dædalus and the Gnomes are only prophecies masked as poetry. The impatient Yankee who can spare only six weeks for Europe, and who must certainly be at home for the fall trade, can now go in sixty hours from Calais to Brindisi—if he wants to go to Brindisi—and in eighteen hours he can pass from Paris to Turin. That worthy Yankee, indeed, might as well travel under ground as over it, for all the moss that he will gather upon his journey; but the true traveler, who knows that the charm of travel is not to arrive, but to see, will look curiously into the tunnel of Mont Cenis as into a mine or a pyramid, but he will not desert the sublime day-long journey by the Stelvio, or the St. Gothard, or the Splügen for fifty minutes of blank subterranean darkness and an arrival at the end of it. It is pleasant to know, as a point of pride in our humanity, that we have outwitted the avalanches, as we have subdued the lightning, and whisper through the sea; but who, for pleasure, would care to make the Northwest Passage when it is discovered, or to scale Kilimandjaro, the peak of the Mountains of the Moon?

Those Yankees who flock across the ocean to travel in Europe, and whose object is pleasure, will still be the greater number, and they will

speak well of the Mont Cenis Tunnel, and go over it. But it is invaluable as another illustration of the triumph of visionaries, as they are called, over practical men. There are indeed no greater tyrants and oppressors than the class usually called practical men—the people who insist that there is no way whatever but the familiar ruts, and who smile superior at the theorists and the visionaries. But every great practical result is the work of visionaries. It is the man whose vision goes beyond routine who destroys routine and lifts the world forward. The sensible men of his time politely sneered at that impracticable Genoese sailor who had an amusing crotchet of reaching the East by sailing West. And what, asked the committee of highly practical members of Parliament—what, Mr. Stephenson, if your locomotive meets a cow? It is easy to fancy the smug, practical disdain of the well-meaning but visionary mechanic which beamed upon the faces of the skeptical committee. “So much the worse for the cow,” is the only answer of the mild maniac. And the test of practical sagacity to-day is successful gambling in the results of the visionary’s plans. “I wash my hands of this fanaticism which overthrows the bulwarks of the British Constitution!” said Earl St. Vincent, leaving the House of Lords when it prohibited the slave-trade. His lordship had no patience with such wild theories. “And what,” exclaimed Lord Eldon—“what will become of all those precious bulwarks, if Romilly’s plan of not hanging people who steal a leg of mutton should prevail? He is a well-meaning man, but a theorist.”

The Eldons and St. Vincents would be ludicrous if they were not so immortal and innumerable. In politics a man suggests a reform, which conscience and common-sense and experience warmly urge. “Pretty,” says my Lord Eldon, “but visionary. Beware of theoretical politicians.” But his lordship is nothing else. He assumes that Romilly is the theorist, and if he is taken at his word, his audience may agree. Romilly, indeed, does not retort the epithet upon him, because Romilly is an honest man and a statesman, and he knows that to use an epithet as an argument is intentionally to appeal to prejudice. When Earl St. Vincent washes his hands, as he says, of fanaticism, and stalks out of the House, nobody need be deceived. Nothing has happened except that his lordship, having no arguments left, says emphatically that it is not his opinion. That is, indeed, a very weighty remark to those who think his opinion of importance, but it is still not an argument, and to how many it is only the opinion of the Earl of Toots!

Eldon and St. Vincent are theorists and visionaries precisely like Romilly and Wilberforce. Their theory is that men are rascals, and will steal all the mutton in the kingdom if they are not hanged straightway when they are caught in the act. Romilly has a theory that the rigor of the laws defeats their execution. A jury will not hang a poor man for stealing a leg of mutton, and if that is the only alternative of acquittal, they will let him go. Or St. Vincent has a theory that there will be no sugar for his lordship’s tea if slaves are not brought by the Middle Passage from Africa to cultivate the cane under the encouraging lash. Wilberforce has a theory, with Goldsmith, that it fares ill with a land where

wealth accumulates and men decay; and he declares, as a proposition in social ethics and political philosophy, that a system of labor which is repugnant to the general moral instinct is bad economy. Here are conflicting theories. Eldon and St. Vincent may be right, and Romilly and Wilberforce wrong, but they are equally theorists. The vision of each is different, but they are equally visionaries. Moreover, the theory of Romilly and Wilberforce has been reduced to practice; and the judgment of all practical men is that the two lordships who sneered at the impracticable theories which opposed their own were a pair of impracticable old f—s. *De mortuis nil nisi bonum.*

Just as science had demonstrated, or a professor said that it had demonstrated, that a train could not pass through a long tunnel without the suffocation of the passengers, a train did pass through, and the passengers were not suffocated. So much the worse for the cow, said the impracticable Stephenson. Is a timid and inhuman theory more respectable than one which is both heroic and humane? Is a theory that men can be affected only by the most mercenary motives necessarily truer than one which allows them to be of a mixed nature, and susceptible to noble emotions and generous appeals? Those who ascribe mean motives plume themselves upon being peculiarly practical. But it is only a difference of theory. Those who believe and who constantly see that men act generously, also, are no more visionary than the others, but their vision is larger and purer.

It is in science and art, and, indeed, in every department of human activity, as it is in politics, that the impracticable men, as they are called, produce the practical results. It is the spirit of these men that has now pierced the Alps, as it has developed every where the human mastery of the globe and of the elemental forces. When, therefore, the young thinker, terribly in earnest, is accosted by the smile of complacent incredulity, and told that he means well, but that he hardly understands human nature, and, without offense, is a *leetle* impracticable and theoretical, let him remember that it is only a theorist who confronts him, and take care not to surrender to a visionary of so poor a kind. It is those who trust their vision, and who trust it the more the purer it is, who discover new worlds, and find the way to the pole, and lay speaking wires under the sea, and abolish the Alps by tunneling them; and it is the same heroic fidelity to a humane theory which reforms criminal law, lengthens human life, improves political methods, and purifies and elevates civilization. Whenever Mephistopheles, with a fine air of the man of the world and a student of human nature, sneers at you as a visionary, the most conclusive of retorts is the *argumentum ad hominem*—“You’re another!”

EVENTS in the city of New York during the past few months have suggested to every body the value of honesty, for although one of the homeliest and least romantic of virtues, it has latterly fallen into great contempt, even among those who do not profess to care for poetry. That honesty is the best policy is one of the sermons of Poor Richard which has been either generally denied or derided. It is denied by those who

see in what a splendid house Dishonesty lives, and in what a glittering equipage it takes its evening drive, and what sumptuous feasts it gives, at which even Honesty does not disdain to sit down. The sermon is derided by those who insist that to be honest for the sake of policy, or for the advantage it brings, is not to be honest, but selfish; and that a man who is honest for the profit of it would be dishonest if the profit were greater. In "Jane Eyre" the good little girl who prefers to be an angel to something worse receives two buns, or tarts, or other toothsome morsels, in reward for her infant piety. And all the little girls prefer to be angels upon the same terms. But if the other side offered a huge plum-cake, Virtue with her two tarts would probably be deserted.

There is often a good-natured laugh at the morality of Hogarth's Industrious and Idle Apprentice. If you are good, says the homely preacher with the pencil—if you get up early and work faithfully, and save your money, and avoid the ale-house and naughty companions, and sing hymns in church with your master's daughter—you shall marry that buxom damsel, and be made a partner by your respectable father-in-law, and inherit his fortune and his business. Who would not be virtuous upon those terms? asks good-humored Skepticism; and it adds that while the picture is pretty, it is not copied from life. Come to the Central Park, says Skepticism, and if eight out of ten of the finest carriages do not belong to the idle apprentice, and if his industrious fellow is not trudging along on foot, I will own myself utterly mistaken. Or let me try to find you the greatest knave in the city, says Skepticism, and I will not go to the Tombs, but to a very different kind of mansion. Indeed, in a busy community prosperous knavery is so familiar a spectacle that the base metal is often enough forgotten in the profuse gilding.

That, indeed, is the penalty that we pay for the pursuit of money. Where money is the universal object, the possessor of money will be practically honored. The honor will undoubtedly be affected in some degree by the method of obtaining the money. If it is a pirate's method or a highwayman's, if we know that throats have been cut and bludgeons used to obtain it, or if we see the thief actually rifling his neighbor's pockets, we shall hardly invite him to dinner, and that money will not become respectable until the next generation. But if the process is more artfully concealed; if the money is not labeled offensively, but is quietly converted into satin damask and Champagne; if we do not read on the buhl and ormolu tables and cabinets an inscription stating that this beautiful work of art was taken out of the throat of a Spanish trader opened for that purpose, or upon the inlaid ebony lounge that it was extracted from the pocket of a ridiculous old widow who had nothing else—if nothing of this gross kind appears, our well-bred curiosity is not impertinent, and we sit upon the sofa and quaff the wine without further thought.

It is in this way that honesty has ceased to command that respect to which it is proverbially entitled. Indeed, to look at many a city congregation, recognizing many of the persons, and knowing their careers, and hearing the precepts of integrity and self-denial, of personal holiness,

and even of martyrdom if need be, which are eloquently urged upon them, inevitably suggests the allusion of Carlyle to the hypocrisy which is so confounded when it is suspected of being hypocritical. Men measure conduct by the real esteem in which it is held. If a foul-mouthed, profane Thersites, who flings his dinner-plate upon the floor at a public hotel to express his dissatisfaction with the banquet, evidently forfeits no social consideration, profanity and ill behavior will not seem to be things to be strenuously avoided. If a sharper who gambles in stocks and cheats his neighbors airily is laughed at pleasantly as an eccentrically queer fellow, an immense impulse is given to the resolution to be eccentrically queer in the same way. If a politician with the conscience of a fox and the honor of an adder bellows his devotion to the dear people, and vociferously appeals to the moral sentiments, while his career insults them all, is thought, first of all, a confounded smart fellow who may not be too nice upon some points, but who always falls upon his feet, such politicians will abound, and public affairs falling into their hands will inevitably suffer.

All these figures are well known to us in this country; and when the eloquent preacher exclaims, "Beyond peradventure, brethren, honesty is the best policy," we all turn and look at the richest man in the congregation, whose invitations we do not dare to refuse, who leads us chained to his triumphal chariot as the Roman generals led Dacian kings, and whose money was all stolen, not earned. And near him sits another whom we should not care to invite to our houses, but for whom we vote, upon some theory that a political intriguer and briber will make good laws. And in the next pew behold the unjust judge, whose health we publicly drink in his own wine when he sends it to us at table. We see them, we meditate their careers, we consider their prosperity, and we gaze at the good preacher who repeats, "Once more, dear brethren, lay it to heart, honesty is the best policy." Might he not as profitably murmur "Mesopotamia?"

But when circumstances, as lately in New York, suddenly scatter the glamour of prosperity and reveal the naked dishonesty, then the old truth which is lodged in the very substance of things appears, that honesty is the best policy, and that, indeed, there is no other. The time comes when, as we seat ourselves in the dazzling drawing-room, upon the luxurious sofa, we suddenly see the inscription frightfully legible, "Stolen from poor widows." And as we rise in trepidation and move toward the buhl cabinet, the legend flashes out all over it, "Stolen from starving orphans." And in terrible light, outdazzling the dazzling drawing-room, we see blazing every where around us, "This is a thief's house, and these are his spoils." The moment that is seen the proverb is vindicated. The buhl remains, but contempt stays with it. Dishonesty has bought its prosperity at too high a price. It has bought money at the cost of every thing that makes money valuable. The prosperous gentleman at whom we all looked when we heard that honesty is the best policy is recognized and branded as a thief. Was not the preacher right? Is not the dishonesty bad policy? The great national benefit of the de-

velopments in New York is moral. Events there have destroyed the prestige of "smartness," and have shown practically that mere money is not enough even for success, and that prosperous swindling is not good policy.

WE spoke last month of the letter in which Cicero says that he hears a friend's gladiators fought capitally; and as we read we wonder at the curious inconsistency, and are amazed that so cultivated and humane and, indeed, so modern a man as Cicero, should be entirely unconscious of the enormity of keeping a band of gladiators as if it were only a band of musicians. The real pain is that he shows a want of instinctive human sympathy. Tradition and habit had made a band of trained fighters seem no more to Cicero than a leash of hounds. This is the essence of caste. It is not only inhuman, but it is organized inhumanity. The superior knows that the inferior is a man exactly like himself. "Hath not a Jew eyes?" says Shylock to the pitiless company who think him pitiless; "hath not a Jew hands, organs, dimensions, senses, affections, passions?.....If you prick us, do we not bleed? if you tickle us, do we not laugh? if you poison us, do we not die? and if you wrong us, shall we not revenge?" Yes, the Venetian merchants know it all. But to them, and even to the noble lady, Portia, a Jew is mere offal.

How many an Englishman to-day reads the letter of Cicero, or hears the play of the "Merchant of Venice," and muses upon the strange times in which human beings were so divided by caste, unconscious that he lives in those very times, and that the house in whose spacious library he is reading Cicero, or the theatre in which he is hearing the play, is full of the same spirit? If it be strange that Cicero two thousand years ago complimented his friend upon his gladiators, and that the merchants of Venice so disdained the Jew, what is it that intelligent and cultivated England of to-day treats with the same hard inhumanity classes of its own people who are of the same race and faith, and whose office is one of the highest service? The manner in which intelligent England treats governesses, for instance, is a thousandfold more surprising, as it is more shameful, than the old Roman's feeling for the foreign gladiators or the Venetian scorn of the Jew. There is an obvious explanation of the feeling of Christendom toward the Jews, for they crucified its Master, and Christendom did not stay to reflect that Mary and Martha and the beloved disciple were of the same race. The Jew was a misbeliever, and that in the medieval ages was enough. But the governess is an Englishwoman, often gently born and nurtured, to whose care children at the most tenderly formative age are committed. She is often a clergyman's daughter, a reduced "lady" of admirable accomplishment and manners, and yet she is treated by the feeling of English society very much as Cicero treated the gladiators of his friend Atticus.

In a recent letter from England there is the following striking picture, whose fidelity is attested by the experience of all who are familiar with the subject. "In America it is honorable to teach the young idea how to shoot. Here it is disgraceful. I know a young lady who is

well educated, a proficient in music and French, a helpless burden upon a small income she would be very glad to increase; but she must not teach, because it would hinder her and her sisters from getting married. The social stigma is too severe. A governess is a social anomaly, occupying a position rather less dignified than that of a lady's-maid, and rather less remunerative than that of a house-maid. The usual salary is from fifty to a hundred dollars a year; a few get two hundred and fifty dollars; and the governess is decidedly *not* treated as one of the family. Young Hopeful must not speak to her on pain of *her* dismissal; the children are rude to her, the servants snub her, and the mistress barely tolerates her presence in the drawing-room when specially required to be there. A nursery governess writes to a London paper that she had to get up at five o'clock to get her master's breakfast, because the servants would not rise so early. Then she washed and dressed the children, helped make the beds and clean the rooms, and then went to the school-room, making herself useful in this position on ten pounds a year."

It is nearly twenty-five years ago that Charlotte Brontë made England and America thrill with her protest against the situation of the governess in "Jane Eyre." Mrs. Reed and her family undoubtedly took out the new novel from Mudie's, and sympathized in a fat, sentimental way with the sufferings of the young governess, and then screwed the thumbs of their own Jane Eyre. Probably Atticus was not cruel to his gladiators. They were foreign barbarians, who fought for his pleasure and that of his guests, and he fed them well for their pains. In the case of Jane Eyre, as of Ginx's Baby, the Englishman seems to be of no higher humanity than the Athenian and the Roman.

Now the Commune, which appalls Europe as if a new descent of Goths and Huns menaced civilization, is only Jane Eyre and the gladiators ceasing to ask, plaintively, "How long, O Lord?" and saying, grimly, "No longer." If we insist that knowledge shall be diffused, we must not forget that knowledge is power. The horse, says the sagacious groom, who has once kicked a wagon to pieces is not so safe as he was before. Knowledge is power. He has learned what he can do; and his power is not only that of kicking with his heels—it is that of spreading terror and apprehension. Knowledge is power. As men come to know the actual situation of society, and reflect upon it, and see in history that God is upon the side of the strongest battalions, they ask why Lazarus should be a million and Dives one: a question which only precedes the determination that it shall be so no longer. If intelligence is to be increased, the old organization of society must be renovated, or it will break. The Goths and Huns were undoubtedly barbarians, but they did overrun Rome; and not the least valuable results of modern civilization are due to the traditions of those barbarians. The French terrorists of '93 seem often to be fiends. Even in Dickens's "Tale of Two Cities," a tale written by a man whose heart beat with the poor and the suffering, their cruelty is unrelieved. But the terror of '93 was the natural growth of the age of Louis the Magnificent. The gay gardens of Fiesole can not stay the plague that desolates the city,

and that to-morrow will begin to pluck these flowers.

The madness, the folly, the cruelty of mobs and revolutions are not all of them. A frantic Commune is not merely an illustration of the natural depravity of man, as it is called. No; it is as significant as the cloud that portends the tornado. If a man can not walk through the new city of New York, looking into its worst slums, its dreadful dens, and reflecting upon its fifty thousand human beings unhappier than brutes and as ignorant, and who multiply themselves immeasurably, without feeling that society is justly reproached, and must somehow pay the penalty, what must be his reflections in crammed and suffocating Europe? At least while "Jane Eyre" still shows the cruel force of caste in England, even in spheres far above the laboring class, and recent revelations in New York disclose the condition of our own gladiators, let us not spare horror for Cicero's curious inhumanity, but curiously observe that we are as indifferent to the barbarians as he, and that mere carelessness and contempt will not save modern society more than they saved that of Cicero's Rome.

It is singular that in the country of Jane Eyre, whose case we have just been considering, the woman's movement, as it is called, has a certain solidity which it has not yet attained in this country. Many most eminent Englishmen are not only known as friends and advocates of the political equality of women, but they have urged it upon Parliament; and while the fashionable woman, or woman of society, as she is called in America, is generally indifferent to the subject, if not openly hostile, Lady Amberley, who will, in the order of nature, soon be Countess Russell, does not hesitate to address a meeting in the country in behalf of the equality of her sex. Yet, again, the laws in England weigh more heavily upon women than in this country; and the movement for their political equality usually contemplates the voting of those who represent property.

The most significant recent event in the history of the cause in the United States is the passage of a resolution by the Massachusetts Republican Convention commending the subject to the thoughtful consideration of all citizens. The president of the Convention, Mr. Hoar, of Worcester, spoke very strongly in favor of the movement in his opening address. It is thus formally introduced into a party platform, not, indeed, as a policy, but as a consideration. The effort at recognition, which has been good-humoredly but resolutely laughed down before, has at length been successful. Such success is emphatic proof of the firm hold which the question has taken of many most practical minds, and it is not to be doubted that the subject will command constantly more attention. Yet it is one which by its associations is so easily assailed by ridicule, and is so susceptible of odious misrepresentation, that nothing is more necessary to its friends than the utmost patience and good humor. It is in itself a question of the utmost gravity both for men and women. It involves a very great change in political habits and thoughts. But grave as it is, its gravity may be readily misconceived and misstated, and, like all great causes, it may sometimes stagger, wounded, in the house of its friends.

Meanwhile a great cause is not to be judged by the follies that attend it, more than civilization by its frontiers. If any body supposes that the question which the Massachusetts Convention commends to thoughtful consideration is one of new methods of divorce, he is as ludicrously mistaken as if he imagined it to be one of a new method of computing eclipses. Yet there is no doubt that the progress of the movement has been very much obstructed by such suppositions. Questionable advocates always harm their cause. There must be such, of course, as bummers must attend an army. But if you want to understand the object of the march, it is better not to mind the bummers, but to inquire at head-quarters. If any body in England had advocated the extension of the suffrage for the reason that it would enable poor men to vote into their pockets the money of rich men, he would do precisely what is done by those who allege that the extension of the suffrage here would produce this or that direful result. It is something that nobody can know. A possibility is not an argument until you have made it an imminent probability.

Every reform has its disagreeable stages of growth, like the human system. Mumps and measles and scarlet fever must not dismay us, however, nor breed despair of the issue. Silly men and silly women, full of conceit and sentimentality, and what is familiarly known as popcock, are, unfortunately, not peculiar to any particular department of human interest and activity. If the new cause is often advocated with feebleness and intolerable illogicality by women, just think of the ill logic and the futility with which it is opposed by men! But as inanity is of no sex, and the foolish of one sex are admitted, why should the wise of the other be excluded? "Oh, dear Mr. Easy Chair," says some friend far away, "you are not *really* in favor of this *unnatural* thing! You would not have the *vine* wrestling with the *oak*, would you? Oh, let us respect the laws of *nature*." Well, well, dear madame, we will do what we can. But have you reflected upon the number of masculine vines and of feminine oaks? Shall we say that oaks only shall vote? That may be wise; but you see that in suggesting it you have abandoned sex as a basis.

Indeed, the oak and vine argument has been retired, after long and meritorious, even if painfully ineffective, service. It is plain that if the progress of the cause is to be stayed, it must be by some other argument than that women are weak and men are strong, for the simple reason that all men are not as strong as all women; and if strength is to determine the question, a great many apparent oaks will be disfranchised, and a great many vines go to the polls. There is no solid argument in that direction but that of the kind mentioned in Bret Harte's little poem, "And hosses—well, hosses is hosses." Women are to be excluded because they are women, and the advantage of the argument is that, at least, it can be stated, even if it can not be understood.

Meanwhile the real argument in the case proceeds. Here is Jane, who quietly and honestly makes her own living and supports her paralytic father and her drunken brother, and every year the father and the brother may decide the disposition of her property, and she may not so much

as express dissent, because it is indelicate and unwomanly for women to mix in politics. Jane does not ask it. Jane has never supposed that any thing else is possible. Jane goes to no meetings, and would blush if you thought she could speak. But no John of clear head who sees her does not feel the argument. And when

Julia, with the same right to speak that Jenny Lind had to sing—namely, the gift of eloquence and the wish to speak—calmly states the argument which John feels, he may muse a little, because it is very new to him. But he doubts no longer, because it is very true to him. And so the question is being answered.

Editor's Literary Record.

MENTAL SCIENCE.

WE do not wonder, on an attentive reading of HERBERT SPENCER'S *Principles of Psychology*, Vol. I. (D. Appleton and Co.), that he has refused to send his works to the critics for review. Even to state within the limits of an ordinary *critique* the extraordinary and original system which he propounds, with any thing like justice to it or its author, is not an easy matter; and to criticise it requires, if not more learning than the critic ordinarily possesses, certainly more room than he allows himself, and a higher degree of interest in abstract metaphysics than it is safe to presume his readers possess. We shall content ourselves here with simply giving very briefly a sketch of the fundamental principle of his system of psychology, referring to the book itself such of our readers as desire to see how he applies this radical but simple principle to the elucidation of the various mental phenomena which it belongs to psychology to explain. The key-note of his philosophy may be expressed in the one word, development. The result, if not the conscious aim, of his psychology, is to show that the distinction commonly made between involuntary and voluntary, instinctive and rational action, is imaginary; or rather that it is like the distinction between infancy and age, or the seed and the tree, one merging into the other, the two extremes of mental activity being connected by a regular series of acts ascending by almost imperceptible grades from the lowest to the highest. The difference between the instinctive act of certain animalculæ in seizing their prey and a scholar in solving the highest problem in natural science is, according to Herbert Spencer, a difference only in degree of mental activity. A Newton is only a highly developed polyp. The process by which he arrives at this conclusion is curious and interesting. After a fashion somewhat peculiar to himself he leads the reader along by steps so gradual, and elucidated by scientific illustrations so interesting, that it is not till the startling conclusion is reached that the student turns back to retrace his steps and seek out the flaw in the logic. Three elements, according to Herbert Spencer, enter into psychology. First, the phenomena in the outer world, or, to use his favorite expression, the environment; second, the phenomena in the inner world; third, the relations between the phenomena of the outer and those of the inner world. It is the proper understanding of this last which constitutes the key to psychology. The lowest animals possess but very little power to adjust themselves to any changes in the outer world. Thus the polyp, stationary by its very nature, is prevented from responding, except in the most

limited degree, to change in its own environment, or adapting itself thereto. This power of adjustment steadily increases through all the forms of life from that of the coral to that of man, the latter possessing powers extending in space and limit, and increasing in complexity, to an extent which raises him almost infinitely above the rudimentary forms of being. Yet his power is the same in kind, the power of adjusting himself to his surroundings; it differs only in extent. Instinct is this power in a limited degree. Intelligence is this power in a higher degree. But there is no line of demarkation, so that one may say, On this side is instinct, on that reason. All powers are the result of education in the individual or the race. Certain animals seem to come into the world divinely endowed with rare instincts. These are, in fact, the result of experience, only it is an experience of long ages inherited from a remote ancestry. Will, in the metaphysician's sense of the term, has no existence. That is, there is no distinct power of choice, and, of course, no freedom of the will, if by that any thing more is meant than the freedom to do what we desire, supposing there are no external hinderances. All psychical changes conform to an inexorable law.

To this brief statement of his philosophy we shall append no criticism here. Our readers will observe respecting it two things. First, clearly, Herbert Spencer is not a materialist, if by that vague and often ill-used term is meant one who reduces all spiritual and mental action to matter and material forces: on the contrary, his whole system rests upon the assumption that there is a radical difference between the outer and the inner world. Second, that he belongs to that school of thinkers, of whom Darwin is regarded as a chief, who undertake to explain all the innumerable varieties of life upon a theory of development. Indeed, his psychology is a necessary complement to Darwin's "Descent of Man," and helps to supply the missing link in the argument of the latter. No one can account himself acquainted with the modern development hypothesis who to a study of Darwin's scientific arguments does not add a knowledge of Spencer's theories. But we think he has rendered metaphysics one valuable service. In other studies men begin with the simple, and ascend to the complex. A knowledge of arithmetic precedes the study of the higher mathematics. A study of the simpler rules of grammar is a necessary foundation to the student of logic and rhetoric. To understand the human frame the organization of lower types must be understood. But in psychology men have hitherto begun at the top. But only men of the most highly developed

intellect are capable of cross-examining their own consciousness, and obtaining from it any clear and definite response. No answer can be obtained from the self-consciousness of children; none from that of the animals. Mental action in its simpler form has therefore not been studied; and the complex forms which have afforded the groundwork of psychology have defied investigation. No wonder that the results have been unsatisfactory, and that men have come to regard psychology as made up of conflicting theories, concerning the truth of which no one could arrive at any just conclusion. If Spencer's studies in comparative psychology shall result in making the latter a recognized science, and in sending the metaphysicians to the bottom round of the ladder as the condition precedent of their reaching the top, the world will owe to him a real debt of gratitude, even if it should never accept his premises, his methods of reasoning, or his startling conclusions.

We have given considerable space to this statement—too brief, however, to be perfect or even adequate—of Herbert Spencer's doctrine of psychology, because he may properly be regarded as the ablest advocate, not of materialism—which he is often, but unjustly, charged with maintaining, unless the doctrine that all our ideas are derived from the material world can be called materialism—but of the development hypothesis applied to mind. It is perhaps enough to say of Professor BASCOM's *Science, Philosophy, and Religion* (G. P. Putnam and Son), that it is one of the ablest critiques on and replies to this philosophy. The author does not concern himself with the outworks—he aims for the citadel. He does not content himself with criticising subordinate points, but he undertakes to show that Herbert Spencer assumes, and so unconsciously demonstrates, the existence of intuitive ideas in the very argument which he employs to disprove their existence. Professor Bascom points out that the sensationalists, in claiming that all mental action is caused by changes in the external world, recognize an intuitive idea of cause and effect which can not be the result of, since it underlies, experience. He shows that in claiming that there is a constant resemblance between the phenomena in the outer and those in the inner world, Herbert Spencer assumes that the idea of resemblance exists universally, and itself underlies mental growth. At the same time he points out as the fatal defect of all such philosophy that, since it maintains that all mental life is developed from the external world, it denies to the mind all power to lay hold of unseen verities. "If we attempt, in religion, to set up this ladder of like and unlike, and climb into the heavens by it, we find it lamentably short." According to it we can neither know nor be assured of immortality. So, though this philosophy is not in form materialistic, for it denies the identity of matter and spirit, it reaches practically a materialistic conclusion by a longer road, since it denies that the soul can take cognizance of any thing but matter and material forces. Professor Bascom, starting out with this denial of the corner-stone of Herbert Spencer's philosophy, meets its conclusions at every point. We shall not attempt here to follow this argument or to estimate its value. It is enough to say that we know of no better way for the student to acquaint himself with the

present aspect of the discussion in philosophy between the sensational and the intuitive school than by reading Herbert Spencer's "Principles of Psychology," especially Parts III. and IV., and then reading Professor Bascom's Lowell Lectures on "Science, Philosophy, and Religion," in reply to it.

The success of Professor, now President, PORTER's work on the "Human Intellect" has led him to give in a condensed form from that work the *Elements of Intellectual Science* (C. Scribner and Co.). As a text-book it is admirable, if the office of the study is to acquaint the student with psychology as it exists in the books—or, rather, in the orthodox books. The work is characterized by knowledge rather than by power, is scholastic rather than original, sends the student to the books to study rather than to himself or to the phenomena of life about him. Its excellences are those of a comprehensive knowledge of books, and a clear statement of what is to be found in them, rather than those of an original and independent investigation into the sources of all knowledge of psychology, self-consciousness, and the testimony of life in the external manifestations of mental phenomena.

RELIGION AND THEOLOGY.

To the scholar Dr. ARNOT's work on *The Parables of our Lord* (Robert Carter and Brothers) will be less valuable than Trench's somewhat analogous yet dissimilar work. And yet, for the practical use of the teacher as well as of the individual reader, we are not sure that it will not prove more valuable. The very scholasticism of Trench's work, and the multiplied and diverse interpretations which he affords the reader, deprive it of all spiritual power. After one has finished the comments, and deduced his own conclusion, he must forget his teacher, though not his lesson, and, by personally pondering the original parable in the light of the suggestions, must come into that sympathy with the parable itself which is the first condition of rightly understanding it. Dr. Arnot's book, on the other hand, awakens from the first a living sympathy with the story itself, and without perplexing the mind with discussions concerning minor points, brings out with force and beauty the essential teaching which lies more or less hidden in the parable. It will prove exceedingly useful not only to the clergyman and the Sabbath-school teacher, but equally so to the individual student of those immortal pictures painted by Jesus for the world's instruction.

If we were required to say why it is that Rev. T. L. CUYLER is one of the most popular religious writers in America, we should be puzzled. Other men excel him in pulpit power, but there is no other man who speaks to the heart with the pen more effectually. We warmly welcome a little collection of his fugitive pieces, *Heart Life* (American Tract Society), not for any novelty in thought, or any peculiar beauty in language, or any strange lighting up of old truths, but for the mystic and inexplicable power which they possess, not through the mind, or the imagination, or the fancy, or even the sentiments, but directly over the heart and conscience.—Professor FREDERIC GARDINER presents three books to the student of the New Testament: a *Harmony of the Four Gospels in Greek*, a *Harmony of the Four Gospels in English*, and a *Life of our*

Lord in the Words of the Gospels, all of them being published by W. F. Draper. The last, founded on the others, is of considerable popular value, because it disregards the division into chapters and verses, and gives the reader the life of Christ in a connected form, and yet in the words of Scripture, in a manner which renders it fresh as a narrative, and which, though unaccompanied by any comment, yet throws light on many circumstances and incidents rendered obscure in our ordinary version because not placed there in their appropriate connection.

POETRY.

THE one radical fault of JOAQUIN MILLER'S *Songs of the Sierras* (Roberts Brothers) is its lack of truth; for truth is the first condition of genuine poetry or romance, as it is of history or philosophy. As a law regulates the seemingly free flight of birds, so law regulates the seemingly wild flights of genuine imagination; and a lawless imagination, though it may startle and entertain for the moment, is never the basis of any thing permanent in literature. The charm of Mr. Miller's poetry is that it introduces us to a wild and roving life among the mountains of the Pacific coast. It has carried our English cousins by storm, because the life itself is all so novel and strange to them. Its fatal fault is that in its portraiture of American character it sacrifices truth to the poet's conceit. Let us take, for example, "Kit Carson's Ride," one of the shortest and also one of the best poems in the volume. Kit Carson and his "stolen brown bride" and old Revels lay in the grass, forty full miles from the Brazos, waiting for dusk to make good their flight from the "red Camanches." Suddenly old Revels's practiced ear detects danger in the distance:

"For the plain is aflame, the prairie on fire,
And feet of wild horses hard flying before
I hear like a sea breaking high on the shore,
While the buffalo come like a surge of the sea,
Driven far by the flame, driving fast on us three,
As a hurricane comes, crushing palms in his ire."

Then follows the fierce ride for life:

"Twenty miles!...thirty miles!...a dim distant
speck,
Then a long-reaching line and the Brazos in sight."

Meanwhile the fire gains upon them. And just before it,

"To right and to left the black buffalo came,
A terrible surf on a red sea of flame."

Old Revels goes down, his horse exhausted and unable to continue the flight. Then the Indian girl's horse begins to falter.

"I looked to my left then, and nose, neck, and shoulder
Sank slowly, sank surely, till back to my thighs;
And up through the black, blowing veil of her hair
Did beam full in mine her two marvelous eyes
With a longing and love, yet a look of despair,
And a pity for me as she felt the smoke fold her,
And flames reaching far for her glorious hair.
Her sinking steed faltered, his eager ears fell
To and fro and unsteady, and all the neck's swell
Did subside and recede, and the nerves fall as dead.

* * * * *

And now as she fell
From the front, and went down in the ocean of fire,
The last that I saw was a look of delight
That I should escape—a love—a desire—
Yet never a word, not a look of appeal,
Lest I should reach hand, should stay hand or stay
heel
One instant for her in my terrible flight."

And so Kit Carson rides into the Brazos all alone on the horse that belonged to his "stolen brown bride," having left her to perish in the flames without one manly effort to rescue her. There is rhythm in the lines; there is poetic genius in the apt and condensed metaphors; there is unmistakable graphic power in the almost melodramatic description. But it is a libel not only on Kit Carson; but on the chivalric body of uncouth but never cowardly border huntsmen of whom he is a type, to represent him riding away into safety on his bride's horse, leaving her to perish without reaching a hand, or staying "one instant for her in his terrible flight." We might possibly pardon such a false portrait if we found it in but a single poem; but it occurs again in the Arizonian who leaves his Indian love to perish in the flood, with never an effort to rescue her; and yet again in "Nicaragua;" and it is formally defended by the author in a subsequently published letter, on the ground that as the Indian race is dying out, his Indian heroes and heroines must die. Perhaps. But this did not render it necessary to belie the chivalry of America, and to represent its heroes as poltroons and cowards. Apart from this inherent vice, which constantly leads Mr. Miller to sacrifice truth to dramatic effect, there are very evident elements of unmistakable power in his poems. But it is a wild power, and, like an untrained vine, the very exuberance of his life impairs somewhat the value of his fruitage. The critics say that he needs cultivation. But it is by no means certain that cultivation will not ruin him. At present he is a lion, as Kit Carson in his trapper's suit might be a lion, in the drawing-rooms of London. When he puts off his uncouth dress, and attires his thoughts in respectable habiliments, it is at least a serious question whether their charm will not vanish, and he himself be discovered to be no lion at all, but only a clever and pleasing but by no means wonderful poet.

There is something inexpressibly touching in the modesty with which Mr. WILLIAM C. BRYANT depreciates his own work in the opening paragraph of the preface to his translation of the *Odyssey of Homer* (James R. Osgood and Co.). "The task of translating verse is not, it is true, merely mechanical, since it requires that the translator should catch from his author somewhat of the glow with which he wrote;" but "a great part of the fatigue which attends original composition long pursued is avoided; and this gentler exercise of the intellectual faculties agrees better with that stage of life when the brain begins to be haunted by a presentiment that the time of its final repose is not far off." For many years one poet after another has undertaken to interpret the father of poetry to English readers, and not one has succeeded. It is not too much to say that Mr. Bryant is the first one who has really produced a Homeric version of Homer. And having achieved a victory which alone had been sufficient to give him undying fame wherever the English tongue is spoken and classic poetry is admired, he intimates that his task does not demand the highest talent or the most arduous labor, and half apologizes for es-saying it, on the ground that the time for his more arduous labors has passed away! The *Odyssey* is a far more attractive poem than the

Iliad. Its romance is more in accord with modern life and feeling. We sicken of the perpetual slaughters recorded in the one; weary of the bombast and the cruelty of its heroes; weary of its heathen and savage chivalry; weary of its sensual deities. On the other hand, the world will never weary of reading the story of Ulysses's weird adventures and Penelope's faithful love. Until our modern pseudo-reformers have taught us to disesteem fidelity and courage in man and woman, this story of life and love will be read with undiminished interest. As to Mr. Bryant's execution of his self-imposed task, we have nothing to add to what we have heretofore said of his *Iliad*. It is not only the best translation of Homer which has ever appeared; it is so incomparably best that there is no rival worthy to be placed beside it. It is first; there is none second.

We have already expressed our approval of both the design and the execution of Mr. WILLIAM J. ROLFE's admirable edition of Shakspeare's plays. The second volume, *The Tempest* (Harper and Brothers), is quite equal to the first. In an introduction the editor gives us critical comments on the play from some distinguished critics—Coleridge, Schlegel, Mrs. Jameson, Hazlitt, and others. The text is printed in a clear and legible type, the notes are exceedingly condensed, the illustrations are good, and the small size of the volume renders it convenient for the reader; and, in a word, the whole edition is admirably adapted not only to schools and seminaries, but also to parlor readings. A Shakspearean reading affords an admirable entertainment for a social evening. Parents who want to provide an enjoyable and, at the same time, useful recreation for the family or the social gathering, could hardly fail to find it in providing half a dozen copies of either of these volumes (from which all objectionable passages have been expunged), and allotting a character to each member of the household, thus reading the play in character. If there be even one dramatic reader in the circle to incite the rest, such a reading is as much more entertaining as it is more instructive than tableaux or games, or the ordinary gossip and chitchat of a miscalled social gathering.

At Jesus' Feet is a very pleasant collection of sacred poetry, arranged so as to give one hymn for every day in the year. Each piece of poetry is accompanied with a prayer and a promise, each consisting of a single text of Scripture. The book is published by the "Episcopal Society for the Promotion of Evangelical Knowledge;" but it is not at all denominational in its character, and contains nothing inconsistent with its catholic dedication to "All who are striving to follow in the footsteps of our loving Saviour."

HISTORY AND BIOGRAPHY.

W. P. FETRIDGE's book on *The Paris Commune* (Harper and Brothers) is a valuable addition to history. It is not a compilation, but an original work, prepared by one who was in Paris during all the scenes which he describes; by one, too, whose professional experience as editor of "Harper's Hand-Book" admirably fits him for the work of gathering and recording the facts in such a case as this. The popular ideas of the Commune have been gathered chiefly from the

imperfect and often contradictory reports of those who could only gather up and transmit rumors and reports, and who often contradicted to-day what they had written yesterday. Even those reporters who were nearest to the scene of action were generally ignorant of those political complications a correct comprehension of which was indispensable to an understanding of the campaign. The organs of the government complained bitterly of the unintentional misrepresentations of M. Thiers which appeared daily in the English journals. "The English reporter," said *Le Temps*, "shrinks from no fatigue or even danger to obtain information for the paper which he represents; but he necessarily remains outside the political world; he sees only the external and military side of events; and the same individual who might have been well placed for the siege of Paris by the Germans is completely bewildered by the events now passing on the same theatre." Even the best-informed French journals were untrustworthy. "Three days in succession," says Mr. Fetridge in his preface, "three different first-class Paris journals gave the last dying words of General Dombrowski, one of the chiefs of the insurrection, all entirely different." Mr. Fetridge gives us the means of correcting the erroneous impressions produced by these imperfect and often positively false reports. He does not, indeed, inquire into the causes of the Communist rebellion. Such an inquiry would involve a philosophical treatise on modern civilization, and a careful and candid consideration of those impulses toward reform which are inspiring the peoples of Europe—impulses whose development into action is often wild, unregulated, and perverted by selfish men for selfish ends. Mr. Fetridge is an indifferent historian. He makes no attempt to conceal his detestation of the excesses perpetrated by the Commune in the name of liberty. But he guards his pages from partiality and prejudice. They bristle with official documents and proclamations. Every act, every utterance, of the Commune is given in its own words. By the history it has itself written it is judged. If Mr. Fetridge had written more dramatically, if he had given to his narrative something more of his own personality, he would have made, perhaps, a more interesting volume, or, rather, one more entertaining. But he has done us a greater service by introducing us into the city, and enabling us to read its history of shame and dishonor from its own open pages, as recorded there by the Commune itself. It is a sad history, but one full of significance to America, and well worth her patient study. For the spirit that broke out into flames in Paris smoulders in New York; the rampant radicalism which is stopped by no scruple in the attainment of its ends, which suppresses the press in the name of free speech, violates the elections in the name of universal suffrage, desecrates the churches in the name of liberty of conscience, and murders the innocent and unoffending without cause and without trial in the name of humanity, exists in America, though it manifests itself as yet only in empty bombast and frothy demagogism. We have journals that only lack favorable circumstances to become a *Mot d'Ordre*—journalists that only lack the opportunity, and perhaps the genius, to become a Rochefort.

It is not ordinarily the highest kind of literary talent which seizes on a popular subject, and makes a book out of it because it is popular. Men that write for the market rarely make great books. Our readers will hardly expect, therefore, to find in R. SHELTON M'KENZIE'S *Life of Sir Walter Scott* (James R. Osgood and Co.) a great book. Despite the statement in his preface that the subject had been on his mind for many years, there are unmistakable indications that the volume was prepared with special reference to the Scott Centenary, if not suggested by it. It is in effect a compilation from Lockhart, and sustains about the same relation to a complete life of Scott that the same author's "Life of Dickens" does to the yet unwritten story of Dickens's life. Nevertheless, for the great mass of readers it will prove the best biography of the great Scotch romancer. It is painstaking and apparently accurate in statement, despite the haste with which it has been prepared for the press. It is written *con amore* by one who wrote, indeed, for the market, and yet with an unmistakable admiration for the subject of his memoir, and an unmistakable enthusiasm in writing it. To those that have been themselves enthusiastic admirers of Scott, and students of his life and character and work, it will afford, of course, but little new information; but for the great mass of the reading public it is the best possible letter of introduction to the "Great Unknown."

SOME JUVENILE BOOKS.

WE believe that either our friends the publishers have some commiseration on the unhappy condition of the book critic, who would otherwise be condemned to read all the sloppy literature which is every year offered to our children, chiefly through the Sunday-school library, and hence send us not all the "milk for babes," but only the cream, or else the innumerable protests which have been uttered against these cheap novelettes is beginning to have an effect, and the juvenile literature is itself improving. We select from a legion only a few that are really worthy, for one reason or another, of some commendation.—The *Judge's Pets* is a series of very entertaining "stories of a family and its dumb friends." The interest does not lie in the apocryphal feats of wisdom and moral excellence performed by the "dumb friends." The stories are, on the contrary, remarkably natural for stories of animals. Nor are they natural history in disguise—a very thin sugar-coating of stupid story over a very big pill of doubtful science. They are just simple, natural stories, whose charm lies in the sympathy they are sure to awaken in the young reader for the animal creation.—The *House in Town*, by the author of the "Wide, Wide World," is only a little fragment of a story. It breaks off so suddenly as to produce an impression that the last chapter might have been omitted by the binder. The fraction we get here is natural and interesting, and if the children have patience to wait for what is to come, and persistence to search for what has gone before, they will get a very fair story. But is it not enough to torture grown persons with serials in newspapers, without putting the infant mind on the rack with serials in a continuous series of books?—*Grandfather's Faith*, by JULIA A. MATHEWS, is better reading for the grandfathers than for the children. A

very bad boy is saved by his grandfather's faith that, despite his wickedness, he will be redeemed at last for the sake of his mother's virtues. It is very well for the grandfathers to have faith that their protégés will be saved at last, but it is doubtful whether it is best to teach the bad boys that their mothers' virtues or their grandfathers' faith will save them.—There is a peculiar charm for the little folks in every thing which JOANNA H. MATHEWS writes, as the many readers of the "Bessie Books" found out long ago. It characterizes *Lilly Norris's Enemy*, which was procrastination, and was conquered at last, though not without a hard battle and some sad experiences.—In *Jessie's Parrot* the moral, "a haughty spirit goeth before a fall," is exemplified in the experience of the little heroine, whose ambition and pride make her a scandalous little liar, till her final disgrace effectually reforms her of falsehood by effectually humbling her pride.—The *Stories of Vinegar Hill* receive a hearty encomium from our juvenile critics, who beg us to proclaim them very interesting. They are; and their moral influence is good. We should like them better if the writer did not in the endeavor to be natural give her young readers so much slang and bad grammar.—*The Rift in the Clouds* is a little collection of thoroughly religious stories, by the author of "Memorials of Hedley Vicars;" stories not merely with a good moral in them, but of distinctively religious experience.—Mother Goose has left behind her a large brood of goslings who inherit her passion for nonsense in poetry without possessing her odd genius for producing it. Of her literary descendants we do not remember to have met one whose nonsense was more reliable than that which we find in *Little Folk Songs*. Some of the verses are exceedingly pretty; all are not nonsense; even those that are so are not vapid nonsense; the pictures are very well designed and executed; typographically the book is admirable; and on second thoughts we are not sure that ALEXINA B. WHITE has not done better for the children than Mother Goose herself.—It is perhaps enough to say of *David Lloyd's Last Will* (A. D. F. Randolph and Co.) that it is by the author of "Jessica's First Prayer" and "Max Krömer." It is, however, less a children's story and more a novel than any preceding work from the same pen. The plot is more elaborate, the characters more fully developed, and more of them, and the whole book a larger and fuller conception. As some very good captains break down when intrusted with the command of a thousand men, so some very good story-tellers prove very poor novel-writers. But our authoress justifies her right to be accounted among the successful novelists of the day. Her book is not less characteristically Christian than its predecessors. In her delineation of Christian character and experience she has a field nearly to herself, and occupies it well. The mystic but mistaken piety of David Lloyd's wife, and the equally mistaken piety of Mark's unconsciously self-righteous philanthropy, are set out in admirable contrast; nor less admirably conceived and drawn is the educative process by which each is made to see that neither walking humbly with God, nor doing justly and loving mercy, but the combination of the two, constitutes true religion. It is a capital story, one to interest parents as well as children.

MISCELLANEOUS.

APPROPRIATE to the approaching Christmas holidays comes CHARLES KINGSLEY's latest book, *At Last: A Christmas in the West Indies* (Harper and Brothers). Those of our readers who have read in our pages last month some account of what he saw and experienced there will need no other attestation of the interest of his narrative. For those who have not done so we may give its characteristics in a very few words. In subject-matter it is out of the usual course traversed by books of travel; in manner it is simple and unaffected, natural, but written by one who has a poet's nature; in descriptions of natural scenery it is graphic; in its portraiture of social life it is minute without being tedious; in its whole tone and spirit it is invested with an individuality, transfused with the author's own personality, and rendered entertaining by narratives

of personal adventure, without ever becoming disagreeable and wearisome by reason of any egotism. It is, in a word, a capital book of travel, and its interest and value are greatly enhanced by its numerous illustrations.

NAST, who is the prince of caricaturists, sends us an *Illustrated Almanac* (Harper and Brothers), which we hope is to be an annual visitor. If we had merely Nast's incomparable pictures to laugh over it would be enough; but we have also, illustrated by his pencil, contributions by John Hay, Mark Twain, G. P. Webster, Josh Billings, S. S. Conant, and others. We venture the prophecy that Nast's Almanac, if continued, will become the comic almanac of America. The illustrations of "Sam Weller's Moral Tale" inspire the wish that he would give us an illustrated edition of Dickens's works—something, at least, to outlive the almanac and the newspaper.

Editor's Scientific Record.

CUTTING GLASS AND STONE BY SAND BLAST.

AT a meeting of the Massachusetts Institute of Technology, held on the 16th of March, an interesting paper was presented by Mr. James Hamblett, upon Tighlman's process for etching upon glass and cutting stone by a blast of sand. For this purpose the glass or stone is simply covered with paper, cut or perforated in the desired pattern, and then exposed to the sand blast, which cuts the material wherever the surface is entirely exposed in a very delicate and well-defined manner, the elasticity of the paper apparently preventing the action of the sand on the covered parts. We have not room for the details of the process by which the sand is directed against the glass; but there seems no doubt that the method promises an important revolution in decorative and constructive art. In eight seconds a pane of common window-glass can be ground or roughened, while ordinary sunk letters in marble, an inch and a half long, can be cut out in less than a minute.

Attention was called by Dr. Kneeland to the agency of a similar principle in nature, and reference made to the observations of Mr. Blake upon the action of the drifting sand on the granite at San Bernardino Pass, in California. According to Professor Wyman, glass windows on Cape Cod sometimes have holes worn in them by the drifting sands blown by the winds. Similar agencies exist in Australia on a large scale, and specimens of hard rock cut into fantastic shapes are not unfrequently found in mineralogical collections.

EXTRACTION OF COPPER FROM REFUSE PYRITES.

The copper-mining industry of Cornwall is said, according to the *Athenæum*, to be suffering from a new form of competition. Iron pyrites, it is stated, is now imported in immense quantities from Sweden and Norway for the manufacture of sulphuric acid; and, after the sulphur is extracted, is operated upon for the two per cent. of copper which it contains. About 4000 tons of metal were obtained in 1869 from

this source, while the entire yield from the native ores the same year was only about 8000 tons.

POISONOUS ANIMAL EMANATIONS.

In a late communication of M. Chauveau to the Academy of Sciences of Paris upon the pretended virulent volatile emanations, and upon the condition in which the virus is thrown into the atmosphere by subjects laboring under contagious maladies, he endeavors to show that the contagious peculiarity in virulent humors does not depend upon the substances dissolved, but upon the solid particles which these humors hold in suspension. From this he concludes that the forms of virus improperly called volatile are incapable of spreading into the atmosphere, and that the elements endowed with virulence can exist in the atmosphere only in the condition of emanations from diseased subjects; that is to say, that they assume the form of solid particles held in suspension.

METALLIC SOAP.

Metallic soap in linseed-oil is highly recommended for coating canvas for wagon covers, tents, etc., as being not only impermeable to moisture, but remaining pliable for a long time without breaking. It can be made with little expense, as follows: Soft soap is to be dissolved in hot water, and a solution of copperas (sulphate of iron) added. The sulphuric acid combines with the potash of the soap, and the oxide of iron is precipitated with the fatty acid as insoluble iron-soap. This is washed and dried and mixed with linseed-oil. The addition of dissolved India rubber to the oil greatly improves the paint.

ARTIFICIAL PORPHYRY.

Messrs. Sepulchre and Ohresser have lately published an account of a method of treating furnace slag so as to obtain a kind of artificial porphyry scarcely inferior in durability or strength to the natural substance. For this purpose they dig furrows in the slag pit having the shape of an

inverted truncated cone, and from twelve to fifteen feet wide, so as to receive the entire amount of slag produced in one or more furnaces at any one drawing off. The melted slag is to be emptied in this by means of suitable channels, and the cavity can be divided up by partitions, so as to cast the mass either in one continuous block, or in a number of blocks of any given shape. Care must be taken to have the slag run under the thickened glassy covering which forms at the beginning of the operation, the object of such a coating being to retain the heat; and it is even necessary sometimes to protect the mass against too rapid cooling by a covering of ashes, as this cooling should occupy several days, varying with the amount of the slag. When the operation is completed a dense homogeneous block or blocks will be found underneath this glassy covering of the character of natural porphyry, as stated.

This material has been tested by suitable methods, and has been found to bear a pressure of about 700 pounds to the cubic centimeter (a cube of about four-tenths of an inch), while for complete crushing a pressure of about 1100 pounds was required. In other experiments with this artificial stone, fracture never occurred under a pressure of less than 600 pounds, and complete crushing only with a pressure of 1000 pounds, while some blocks resisted a pressure of 1300 or 1400 pounds.

PELOUZE METHOD OF PRESERVING MEAT.

In a late number of the *Comptes Rendus M.* Pelouze announces his rediscovery of a process for the preservation of meat invented during the last century by Vilaris, of Bordeaux, animal substances being preserved, even when exposed to the air, for several years, without showing by either taste or smell the presence of any preservative agent. The actual details of the process itself are not presented in the communication, but have been placed in a sealed package and deposited, with appropriate samples, with the secretary of the French Academy of Sciences.

METACHLORAL.

Dr. Richardson, of London, has lately been experimenting upon metachloral, a substance possessing mild narcotic properties, isomeric with chloral, and produced when chloral hydrate is brought into contact with sulphuric acid. Chloral is also changed spontaneously into metachloral when kept for a long time in a stoppered bottle, or when a quantity of water insufficient to produce the hydrate is added to it. Heat converts metachloral into the liquid chloral, which becomes the hydrate on the addition of a sufficient quantity of water. Dr. Richardson also calls attention to the fact that chloral, from its affinity to water, is a caustic, and that its use may, perhaps, sometimes be advisable in this connection, in view of its after soothing effects.

REMOVAL OF GREASE SPOTS.

In removing grease spots from fabrics by means of benzine or petroleum it often happens that a colored and stained outline of the portion moistened is left. This can be prevented by the application of a layer of gypsum extending a little beyond the moistened region. When dry, the powder is to be shaken and brushed off, when no trace of the spot will remain.

POISON SERPENTS IN INDIA.

It was stated some time ago by one of the India papers that a great many deaths were occurring in that country from the bites of poisonous serpents; and statistics were given on this subject which were discredited by various writers. We learn, however, by official records, that the number of persons who have died from this cause may be safely estimated at 40,000 per annum. The low condition of the treasury is given as the reason which prevents the government from renewing its former offer of reward for killing these serpents. A list of the bounties paid for destroying this class of noxious animals in a very small district showed that poisonous serpents were brought in at the rate of 1200 a day; and in the course of a couple of months the payments, at the rate of from six to twelve cents each, amounted to \$50,000.

ANIMAL ORIGIN OF PETROLEUM.

As a counterpoise to the suggestion of some geologists that petroleum and asphaltum are of vegetable origin, it is now maintained that these substances are derived from animal remains. This latter view is thought to be substantiated by the fact of the absence of iodine, which would have been present if derived from sea-weeds; and also, on the other hand, by the presence of ammonia, which does not belong to the vegetable kingdom. Furthermore, asphaltum and bitumen frequently occur in strata which are rich in animal remains, from which they may have been derived by the action of intense heat with great pressure.

KEEPING FISH FRESH WITH SUGAR.

A method adopted in Portugal for preserving fish consists in removing the viscera and sprinkling sugar over the interior, keeping the fish in a horizontal position, so that the sugar may penetrate as much as possible. It is said that fish prepared in this way can be kept completely fresh for a long time, the savor being as perfect as if recently caught. Salmon thus treated before salting and smoking possess a much more agreeable taste, a table-spoonful of sugar being sufficient for a five-pound fish.

EXTRACTION OF ANILINE DYES FROM FABRICS.

Among the problems connected with the art of dyeing, one of much importance is the best method of extracting aniline colors from cloths without injuring the fabric, especially those which it is desired to dye anew; and to solve this Dr. Reimann, an eminent authority on these subjects, publishes a detailed paper in his *Dyer's Journal*.

For this end several methods present themselves, the first referred to being the use of chlorine, which, however, is only applicable to cotton—this agent, whether in the form of gas or of chloride of lime, being excluded when we have to deal with substances consisting principally or partially of wool. The simplest method of accomplishing the object in this instance consists in digesting the fabrics for a sufficient length of time in alcohol of 90 per cent., which usually completes the decolorization in a short space of time. The same alcohol can be used several times in succession, and can afterward be puri-

fied by rectification or redistillation, so as to involve but little loss. The work is best done in a well-covered copper kettle, which is to be set in boiling water. A little hydrochloric acid may be added if the articles are not too delicate, thereby increasing the solubility of the aniline colors.

Still a third method is based upon the fact that all the aniline colors pass into given uncolored combinations when brought into contact with hydrogen. Thus fuchsin red is almost immediately decolorized when hydrogen is developed in its solution—the same taking place with violet, blue, and green. This principle has long been applied in the so-called etch printing, in which the aniline colors are extracted in particular parts of the pattern by means of the hydrogen. This is done by laying on a sheet of metallic zinc, with water and the proper sizing. Water consists of hydrogen and oxygen; the metallic zinc takes the oxygen from the water, and the hydrogen developed renders the aniline tints colorless. After this it is only necessary to rinse out the fabric in order to extract the colorless combination.

Again, by saturating the substance to be deprived of its aniline dye with a feeble acid, such as vinegar or much-diluted hydrochloric acid, and sprinkling the whole with powdered zinc, the color will be removed, especially if the fabric be slightly heated. This process is, however, much too complicated; and instead of it we can better use liquids which will give off hydrogen, and thus have a reducing influence. Such a liquid we find in the solution of chloride of tin, usually known as the salt of tin. This must be of the very best quality to be efficacious, and in external appearance should be of a white color, and composed of clear, dry, and tolerably transparent crystals. A solution of such a salt of tin should be placed in a stone vessel and diluted until it can not injure the fabric (about one to two degrees B. of strength), and some leaves of tin-foil placed at the bottom of the vessel. The fabrics, previously rendered perfectly free from dirt or grease, are to be placed in the solution and the vessel covered, the whole being then heated by immersion in boiling water.

As soon as the decolorization has been accomplished the cloth is to be taken out and rinsed in clean water, previously warmed. Generally a new fabric should be left in the hot solution from a quarter to half an hour, and the vessel then be set aside to cool; after which the color will be found to have vanished completely.

There still remain instances, however, in which even this efficient method does not entirely accomplish its object; and the last resort, which is absolutely certain and never-failing, is to the cyanide of potassium. This, however, is a deadly poison even in a very small quantity, and the utmost precaution must be adopted in using it. The operator must be certain that he has no sore or cut on the hand, as contact with the liquid in that case would be extremely dangerous, although while the skin remains perfectly sound no evil effect will be produced by contact. A stone vessel is to be selected, in which a small quantity of cyanide of potassium is to be introduced, and hot water poured upon it, so as to make a solution of one-half to one degree B. Care must be taken not to inhale any of the vapor of the solution. The

whole is to be stirred well with a long and strong glass rod, and the operation conducted in the open air, so that no harm may result from the condensation of the vapor. The fabric in question, previously well cleaned, is now placed in the vessel, and pushed under the liquid with the glass rod, and the top of the vessel laid on.

It will be advisable to adopt some method to keep the solution warm, such as immersing the stone vessel in a wooden tub properly supplied with steam or hot water. Should the vessel crack and the liquid leak out, it would in this instance become diluted with the surrounding water, and thus be less dangerous. After a short time the lid should be removed by taking it off at the end of a long handle, allowing the vapors to pass off before the operator comes near. By means of the glass rod the cloth is to be lifted, and if not entirely white, is to be replaced and the process continued still longer. When finished the cloth is to be transferred by means of the glass rod to a large vessel containing hot water, and stirred around for a time, then removed and rinsed off. The solution of the cyanide of potassium can be used several times without losing its power, especially if a solution of sulphate of iron be stirred in occasionally, producing a deposit of Berlin blue.

We give only an abstract of the article of Dr. Reimann, referring our reader to the original for further details. Throughout the whole paper injunctions are continually laid upon operators to avoid very carefully the inhaling of the fumes of the solution, or touching it in any way except through the intervention of the glass rod.

COST OF ARTIFICIAL ICE.

In Dingler's *Polytechnic Journal* we find a careful comparison of the cost of the production of ice by means of the best-known machines for manufacturing it now in use in Europe. One of these—that of Carré—was found to be capable of producing forty-eight hundred-weight of ice in twelve hours, at a cost of fourteen cents per hundred-weight; while the expense of manufacturing the same quantity by the Windhausen machine amounted to nearly eighteen cents, thus showing a decided advantage in favor of the first-mentioned apparatus.

PHOTOGRAPHING MAGNETIC CURVES.

Professor Mayer, of Lehigh University, has lately devised an ingenious method of fixing, photographing, and exhibiting the magnetic spectra. For this purpose he takes a clean plate of thin glass and coats it with a film of shellac, formed by flowing over it an alcoholic solution of this substance, just as the photographic print is coated with collodion. After the plate has remained a day or two in a dry atmosphere it is placed over a magnet or magnets, with the ends resting on slips of wood so that the under surface of the plate just touches the magnet. Fine iron filings are now sifted uniformly over the film of lac by means of a fine sieve. The spectrum is then produced on vibrating the plate, by letting fall vertically upon it, at different points, a light piece of copper wire. The plate is now cautiously lifted off the magnet, and brought quite close to the under surface of a cast iron plate which has been well heated. Here the shellac is softened uniformly, and the iron fil-

ings sink into the film, and are fixed. The heat should be allowed to continue until the metallic lustre of the filings has disappeared by sinking into the shellac, and the film appears quite transparent. After the plate is cooled, any superfluous filings are knocked off by inverting and gently tapping it. These plates may then be used either as permanent objects of exhibition, or as negatives from which to print, in the usual way, an accurate representation of the foci, lines of direction, etc. They can also be used as slides for a magic lantern.

EFFECT OF COLD ON IRON AND STEEL.

For many years it has been almost an axiom among civil engineers that great cold tended to produce a brittle condition of iron and steel, and that by this hypothesis might be explained the alleged increase in the percentage of railway accidents by the breaking of tires and axles during the cold season as compared with the warm. A recent communication before the Literary and Philosophical Society of Manchester, by Mr. Brockbank, maintained the view just stated; but in the discussion which followed several eminent engineers entered their protest against it, and adduced facts which tend to an entirely opposite conclusion. According to Dr. Joule, numerous experiments by himself and others proved that, so far from iron and steel being weakened by cold, they are actually made positively stronger, resisting shocks and strains before which they yielded when brought to a higher temperature. While not denying the fact of the greater frequency of fractures during the cold weather, Dr. Joule refers these to the increased hardness of the ground by freezing, by which the iron is subjected to a greater strain or shock than under ordinary circumstances.

PREPARATION OF ALBUMEN FROM BLOOD.

The preparation, on a large scale, of albumen from blood is, we learn, carried on successfully at establishments in North Germany and Hungary, and it is furnished at one-half the cost of egg albumen, although equal to it in all respects except color. It is said that three thousand pounds of blood will yield one hundred and ten pounds of albumen; and it is thought that, by proper care of the immense quantities of blood every day wasted, an ample supply can be furnished, which is not the case at the present time, compared with the extent to which albumen is required for refining sugar, sizing goods, etc.

THEORY OF CHOLERA.

Mr. Alpheus Cholmeton, of the department of the Gard, in France, republishes his theory in regard to cholera. This, he thinks, is occasioned by the development of animalcules arising from dead bodies that have not been properly buried. These animalcules, in floating through the atmosphere, are inhaled by mankind, which results, under certain circumstances, in producing disease. We are especially advised, therefore, in cholera times, particularly when in attendance on cholera patients, to wear a veil of a very thick texture, and perhaps to breathe through cotton, so that the parasites can not pass. He maintains that these organisms can be seen in the atmosphere as a visible column, especially at about the time of the rising and setting of the sun.

One conclusion to which he arrives is that it is very important that dead bodies be buried to a sufficient depth, and that it would be still better to resume the practice of burning the dead, as was done to so great an extent by the ancients.

DYEING WOOL ANILINE BLUE.

The following method is recommended for dyeing aniline blue upon wool. The quantities given are sufficient for twenty yards. Three-quarters of a pound of Marseilles soap are dissolved by boiling, and when cold and sufficiently diluted with soft water, the goods are soaked in the liquid and well wrung. They are then placed in a bath of hot water acidulated with sulphuric acid, to which the coloring solution is added in accordance with the shade required. This solution consists of an ounce and a half of aniline blue in a pound and a half of alcohol of 90 per cent. Rinsing, drying, pressing, and, when found suitable, sizing with a little glue, finish the process.

DIFFERENCE OF MEAN TEMPERATURE AT VARIOUS HEIGHTS.

The announcement has lately been made by Mr. Glaisher, the eminent British meteorologist, that the monthly mean temperature of the air at twenty-two feet of elevation is higher than at four feet at all hours of the day and night in January, February, November, and December; in the afternoon and during the night hours in the months of March, April, August, September, and October; and in the evening hours and during the night in the months of May, June, and July. He also states that the mean monthly temperature of the air, at twenty-two feet and at fifty feet, is higher during the evening and night hours through the year than at the height of four feet, and also higher night and day during the winter months.

COMBUSTION OF COAL DUST.

An enormous amount of coal in the form of dust and small fragments is every year wasted in our coal mines; and although many propositions have been made to utilize it by consolidating it into bricks, it has been found that the expense of this is greater than that attendant upon the extraction of large coal, and consequently the waste has still continued. It has been ascertained, however, that by taking fine coal dust and placing it in a furnace, with the exact quantity of air which is requisite to effect the combustion of the coal, a mass of flame is obtained of the highest temperature, which does its work effectually, and emits no smoke whatever from the chimney. The results promised from this method of using fuel are so striking as almost to render it probable that when dust can not be obtained, the coal itself will be reduced to powder for the purpose before being placed in the furnace.

EXTIRPATION OF SERPENTS IN THE WEST INDIES.

The great abundance of poisonous serpents in Saint Lucia and other adjacent West India islands has given rise to inquiries as to methods of exterminating them, on account of their having become a serious impediment to the proper cultivation of the island and to the reclamation

of the wild lands of the interior. Among other means suggested for this purpose is the introduction of the mongoose, the secretary-bird of Africa, and the kingfisher of Australia. Specimens of the first-named animal have been forwarded to Saint Lucia for the purpose of trying the experiment; and reports of encounters between the mongoose and serpents have been since noted, in all of which the former invariably came off successful. In several instances the animal appeared to have been bitten in its encounter, but with no injurious result.

It is probable, as already suggested by several persons, that the object in view would be completely attained within a reasonable time by allowing hogs to run wild and multiply in the islands. Their powers in destroying rattlesnakes in North America are well known; and it is not at all unlikely that they would be as effective in the West Indies, although, from the great abundance of serpents, quite a long time might be needed before any appreciable effect would be manifest.

A NEW CINCHONA ALKALOID.

A new alkaloid has, it is said, been detected in the mother liquor obtained in the manufacture of sulphate of quinine, distinguishable from the cinchona alkaloids by the solubility of its salts, which renders it very difficult of separation from the uncrystallizable quinoidin. It has not yet been determined whether it is contained in all the species of cinchona, or, if not, in which of them; nor have its physiological properties been experimented upon.

INDUSTRIAL NOVELTIES IN THE LONDON EXHIBITION OF 1871.

In a late article we referred to the poverty of the International Exhibition at South Kensington, with the exception of the departments of pottery and of woollen manufactures; but we have since learned that this is in accordance with the plan of the committee having matters in charge. It is proposed to have a similar exhibition annually, in which the great strength of effort shall be expended on the exhibition of one or two classes in their most complete form; although, incidentally, contributions in other departments will not be refused. The exhibitions are to be held in permanent buildings erected along the east and west sides of the gardens of the Horticultural Society.

Among the articles in the wool department upon which much commendation is bestowed is an arrangement for washing sheep to cleanse the fleece. For this purpose the sheep is placed inside of a cage of water pipes, perforated throughout, and connected with a head of water, through which, on turning a cock, innumerable jets of water pass with considerable force, all playing from every direction upon the animal. The washing is much more thorough than could be done by hand labor, and the aid of the man usually required to hold the sheep is thereby saved. Another machine is intended for shearing the sheep, which it does in the most satisfactory manner.

Among the miscellaneous articles of the museum, Admiral Inglefield's steering gear is mentioned with approbation, and it is stated that this has been applied to some of the larger iron-clad

ships with great success. In rough weather from thirty to forty men are required at the tiller of these huge monsters, and even then the force of the waves will sometimes be too much for them. The gear in question utilizes the great hydrostatic pressure due to the twenty or thirty feet of water in which the ship swims; the water being allowed to come into cylinders and to work pistons within them, much after the manner steam would do in an ordinary engine, and thus a motive power is secured equal to one thousand pounds to the square inch, in small hydraulic rams attached to the tiller. A single man can by this method steer the largest ship in the roughest weather.

Another machine exhibited is a model by Mr. Tommasi for utilizing the tides as a source of power for machinery. This, however, is considered rather curious than useful, as long as coal is held at any thing near its present price. Some of the other articles mentioned are Thomson's road-steamer, with India rubber tires; Hodgson's wire tramway, with the saddles of the buckets clinging on to the wire rope by simple adhesion; Girdwood's copper wire steam-packing, the condensation of water within which forms the lubricant; Siemens's electrical pyrometer, for measuring the degrees of very high temperatures; Michele's cement-testing machine, in which the bent lever is most ingeniously applied; Captain Scott's selenitic cement; and other practical inventions worthy of close investigation and consideration.

CHLORAL HYDRATE AND COD-LIVER OIL.

An Italian pharmaceutical journal contains the announcement that by the addition of hydrate of chloral to cod-liver oil this substance will be rendered much less nauseous, while at the same time preventing the night sweats of the patient, inducing sleep, and creating an appetite. The formula given consists in adding ten grains of the crystals of pure chloral hydrate to one hundred and forty grains of the cod-liver oil, and digesting them in a sand-bath at a gentle heat. The dose is to be six table-spoonfuls daily.

ASEPTIN.

A substance called *aseptin* has recently been introduced into trade by a Swedish dealer as a preservative material for milk, meat, etc. This is said to be simply boracic acid, or borax; the double aseptin consisting of two parts of borax to one part of alum. Putrefaction is said to be prevented by the addition of this preparation, but mouldiness in animal substances is not. Although a very short time has elapsed since aseptin has been brought into notice, thousands of pounds are now sold almost daily in Scandinavia and Germany.

HABIT OF HORNED TOAD.

At the January meeting of the Zoological Society, in London, a communication was presented from Mr. John Wallace upon a hitherto unobserved peculiarity of the horned toad, or *Phrynosoma*, of California. This animal, according to his statement, under certain circumstances (apparently as a mode of self-protection) squirts out from one of its eyes a jet of bright red liquid very much like blood. This he observed three times, in as many different individuals, although

others did not present any peculiarity. They generally use this means of defense when first captured, the liquid being squirted a distance of six inches in one instance. This statement, if it be really a fact, has, as far as we know, no confirmation by any corresponding observation on the part of any of our American naturalists, and we commend the consideration of it to such as reside where this animal can be obtained. The species is not indicated, but the observations were made in the vicinity of Stockton, California.

HYDROBROMATE OF CODEIA, ETC.

Few substances of the vegetable kingdom furnish so extensive a field for investigation as opium, and we seem even yet to be far from having determined all its simple constituents, to say nothing of the combinations which these are capable of forming with one class of bodies or another. In the course of an elaborate inquiry by Dr. Wright upon the action of hydrochloric and hydrobromic acids upon codeia and morphine, two of these opium bodies, it was ascertained that the salts thus formed produced a very peculiar physiological action upon animals, whether administered by subcutaneous injection or by the mouth; this application to adult cats developing in a very few minutes a condition of great excitement, almost amounting to delirium, and accompanied by a copious flow of saliva and a great dilatation of the pupils. This appeared to be due, in part, to increased sensitiveness to noise, and partly to an impulse to rush around. When the same tests were made with kittens, though there were the same general effects produced, the stage of excitement, which in adults passed off gradually in a few hours, was followed by a condition closely resembling that of alcoholic intoxication, especially in the want of co-ordination of muscular movements. Rabbits, on the contrary, appeared to be affected but little, or not at all. Vomiting was not observed in any of the cases experimented upon.

AN EIGHTH RIB IN MAN.

Mr. Perrin makes a communication to *Nature* in regard to the occasional occurrence of an eighth true rib in man; although it has been generally considered that seven form the absolute limit. This eighth rib is sometimes found on one side only, still more rarely on both sides, and it is suggested by Mr. Perrin that cases of this abnormal character possibly occur more frequently than has been suspected. The maximum normal number of sternal ribs appears to be ten, but in the higher primates the tenth, ninth, and eighth are successively lost in the transition from their lower to the higher forms. In the carnivora the sternal ribs are usually nine, although the Esquimaux dog, the arctic wolf, and the *proteles* have only eight. The common badger of Europe has ten true ribs.

ACETATE OF ZINC A PRECIPITATE OF HÆMIN.

Gunning has discovered in acetate of zinc a reagent that precipitates the slightest traces of the coloring matter of blood from solutions, even where the liquids are so dilute as to be colorless. Blood washed from the hands in a pail of water can readily be detected in this way. The flocculent precipitate thrown down by acetate of

zinc must be washed by decantation, and finally collected on a watch-glass, and allowed to dry, when the microscope will readily reveal hæmin crystals if any blood be present.

MIND IN LOWER ANIMALS.

Dr. Lander Lindsay, in an essay just published, which has excited some attention, takes the ground that the mind of the lower animals does not differ in kind from that of man, and that they possess the same affections, virtues, moral sense, and capacity for education, and are liable to the same kinds of mental disorders.

BARYTES WHITE.

Mr. Pfundheller informs us that the most beautiful white known to dyers may be obtained by the following method: For each hundred pounds of wool, three pounds of alum, one pound of cream of tartar, and two pounds of sulphuric acid are to be combined with one-eighth of an ounce of soluble iodine violet, and the wool immersed in the solution at a temperature of 122 degrees Fahr., and stirred round for an hour at this temperature. Another bath is to be made in the mean time, in a fresh kettle, with three pounds of chloride of barium, and the whole immersed in this, and kept at a temperature of 122 degrees Fahr. for two hours. By this process the sulphate of barytes, the most beautiful of whites, will be thrown down in the fibre of the wool, which has been saturated in the first bath with the sulphuric acid, and it will gain about eighteen per cent. in weight.

TEETH OF THE STURGEON.

To those who are accustomed to consider our American sturgeon as a comparatively worthless fish (large numbers, indeed, when captured, being thrown away as of no value), it may be a matter of surprise to know that a small European species, the sterlet, is among the kinds of fish most highly esteemed in Russia. Efforts are now being made to introduce this species into Great Britain by transporting the ova, and about two hundred young fish have already been turned out on the estate of the Duke of Sutherland. A very interesting fact was observed during the development of these fish—namely, that immediately behind the lips of the sterlet, just escaped from the egg, were found eighteen pretty strong curved teeth, with which they fought each other quite ferociously.

WAS THE PRE-GLACIAL HEAT CAUSED BY A METEORIC BODY?

A French savant, M. De Latterade, has communicated to the Académie des Sciences the remarkable theory that during the period which preceded the glacial epoch, when the temperature of the northern hemisphere was far higher than it is at present, as evidenced by the fossil remains of the European and American tertiary formations, this accession of temperature was caused by the proximity to the earth of a very powerful star or second sun, which gave to the earth an immense quantity of heat, and which has since receded into the abysses of celestial space. M. Latterade contends that this supplementary sun did not disturb the elements of the planets, because its attractive power was less than its heating power. He states, moreover,

that the heating power does not vary with the mass, like the attractive power.

COPYING PICTURES BY COLLODION.

According to Mr. Kleffel, if a glass plate be coated with collodion in the ordinary manner, and, after the liquid has set, a piece of printed paper be pressed lightly upon the surface by the hand, a very exact reproduction of the letters or figures will be found impressed upon the collodion when the paper is removed, the design remaining perfectly visible after the complete drying of the film. It is suggested that this may be the germ of some important applications in the way of the reproduction of printed matter, without injury to the original.

HYDRAMYLE.

The new anæsthetic, hydramyle, to which we have already referred, continues to grow in promise of value, having now been administered quite frequently by Dr. Richardson with much success. It seems especially adapted for short operations, such as the extraction of teeth, and is so rapid in its action that in one instance the patient was rendered insensible, a molar tooth extracted, and recovery completed in the space of fifty seconds. For the extraction of a tooth Dr. Richardson allows the patient to inhale for twenty to twenty-five seconds, and then, although still conscious, the vapor is withdrawn, and afterward a deep but brief period of unconsciousness comes on, during which the operation is performed. The delay in the production of anæsthesia is due to the insolubility of the hydramyle, time being required for the blood to take up the narcotic and carry it to the nervous centres after the lungs have been charged with the vapor.

EXTINCTION OF THE MOA.

The question of the antiquity of remains of giant birds, found in New Zealand and known among the natives as the moa, received a few years ago an additional zest by the discovery of a skeleton containing portions of the ligaments, skin, and feathers still attached. This forms one of the treasures of the museum at York, and was found in the interior of the province of Otago.

Dr. Hector, in a late communication to *Nature*, announces the discovery of a second specimen of the same character, being the cervical vertebra of the moa, apparently of the largest size, upon the posterior aspect of which the skin, partially covered with feathers, is still attached by the shriveled muscles and ligaments. He also informs us that all the facts connected with the discovery of this moa in New Zealand tend to show that their extermination was due largely to human agencies, and that there seemed to be a special class of natives, known as moa-hunters, who were occupied in their pursuit. Numerous localities have been discovered where the bones of the moa remain in immense profusion, all more or less mutilated, split, or charred, as the result of human agency, and usually accompanied by native implements of stone, some of which are of great perfection of finish. In addition, however, to the destruction of these birds by the natives, another cause that tended to their extermination has doubtless come into

play—namely, that of the forest fires that so frequently occur in New Zealand and elsewhere. On numerous occasions masses of moa bones, belonging to large numbers of skeletons, have been found in localities where the birds seemed to have been hemmed in so as to be unable to escape. These places consist mainly of spurs of the hills, jutting to a considerable distance out into the lakes, where it is probable the birds congregated to escape the flames, which by approaching near them destroyed them by suffocation, in consequence of their unwillingness to enter the water. Dr. Hector himself found at the southwest extremity of a triangular plain, by the side of the Wakatipu Lake, no less than thirty-seven of such skeleton heaps, situated precisely as just indicated.

COCCOLITHS OF VEGETABLE, NOT ANIMAL ORIGIN.

The question of how the lowest forms of animal life which abound in the deep sea obtain their food where no vegetable life is present has long presented great difficulties to naturalists. Mr. H. J. Carter, in a paper in the "Annals and Magazine of Natural History," cuts the Gordian knot by the hypothesis that the coccoliths and coccospheres found in such enormous numbers in deep-sea dredgings, and recently identified by Gumbel and others as entering largely into the composition of some very ancient rocks, are not, as held by Professor Huxley and others, animals of low organization, but are referable in fact to the vegetable kingdom. His conclusion has not, however, been generally accepted by naturalists.

ARE FROZEN PLANTS KILLED IN FREEZING OR IN THAWING?

The question whether a plant killed by frost is destroyed while freezing or during the subsequent thawing is one that has excited considerable interest on the part of physiologists, who have, however, in vain endeavored to answer it. Quite unexpectedly a method has been placed at the command of experimenters that enables them to solve the problem satisfactorily. In some tropical countries plants of the genus *Phajus* and *Galanthe* have long been known to contain indigo; this, while they are living, being in the form of indigo-white, or indigotin, the blue color exhibiting itself only after death. If, for instance, the milky white flowers of the *Galanthe* be crushed in the hand, they become instantaneously blue, furnishing an excellent opportunity of showing the relationship between indigo and indigotin. If, now, these flowers be frozen, they immediately assume the blue color of indigo, appearing at first a pale blue, then darker, the pollen masses alone retaining their natural yellow color throughout. The cold air supplies the place of a reagent, and is, indeed, more sensitive than any other that chemistry can produce. The flower stems with their white bracts are also changed into blue. These experiments, more or less modified, have been applied repeatedly to the plants mentioned, and to others allied to them, and always with the definite result of proving that death occurs during the freezing, and is not deferred until the thawing out. Similar changes of color are produced on these plants by such chemical agencies as cause death in whole or in part, as by immersion in sulphide of carbon, ethe-

real oil, ether, etc. Concentrated solutions of hydrochlorate of morphia and nitrate of strychnine do not, however, cause this change, showing that they have comparatively little noxious influence upon plants.

ELECTRO-ACUPUNCTURE OF THE ARCH OF THE AORTA.

Among the novelties of surgical science may be mentioned the use of electro-acupuncture, for the relief of aneurism of the arch of the aorta, as practiced in Italy. Experiments in this direction have been quite successful, involving no danger, and giving the patient relief from great suffering.

CALVERT ON SPONTANEOUS GENERATION.

In a late paper Mr. Crace Calvert, well known for his researches upon protoplasmic life in its different conditions, has recently instituted a series of inquiries as to whether the germs existing or produced in a liquid in a state of fermentation or of putrefaction could be conveyed to a liquid susceptible of entering into these states, and he has just presented the first results of his inquiries to the Royal Society of London, as reported by the *Chemical News*. In the course of his experiments he was astonished to find how rapid the development of germ life may be under certain circumstances. Thus, if the white of a new-laid egg be mixed with water (free from life), and exposed to the atmosphere for only fifteen minutes in the month of August or September, it will show life in abundance. For this reason he was misled in many of his earlier experiments in not being sufficiently careful to avoid even momentary exposure to the atmosphere. To the want of a knowledge of this fact he ascribes all the erroneous conclusions arrived at by several persons who have devoted their attention to the subject of spontaneous generation. Referring to the paper itself for details, we may say that a positive conclusion against the truth of the theory of spontaneous generation was reached by Mr. Calvert, ranging him thus on the side of Professor Huxley, Professor Tyndall, and others, as against Dr. Bastian and his confrères. One of his experiments tended to show that although oxygen appears to favor the development of germs, it does not appear to favor their reproduction, and that the increase of life in an albumen solution is not due to reproduction merely, but to the introduction of fresh germs from the atmosphere.

MR. WILLIAM THOMPSON ON DARWINIANISM.

Mr. William Thompson, in his address before the British Association at Edinburgh, takes occasion to give in his adhesion to the Darwinian views of evolution, and not only expresses his belief that all the higher organisms now covering the face of the earth have most probably developed themselves from lower ones, but suggests also that these were most likely derived from meteoric stones and other matter fallen from the planets.

M'DONALD'S THEORY OF NERVOUS ACTION.

Dr. Robert M'Donald has presented a new theory of nervous action to the Royal Irish Academy, this being expressed in the words of the author as follows: "I conceive that the va-

rious peripheral expansions of sensitive nerves take up undulations or vibrations, and convert them into waves, capable of being propagated along nervous tissue (neuricity, as it has been named). Thus the same nerve tubule may be able to transmit along it vibrations differing in character, and hence give rise to different sensations; and, consequently, the same nerve tubule may, in its normal condition, transmit the wave which produces the idea of simple contact, or that which produces the idea of heat; or, again, the same nerve tubules in the optic nerve which propagate the undulations of red, may also propagate, in normal vision, those which excite the idea of yellow or blue, and so for other senses. I advocate this undulatory theory of sensation in preference to the theory of distinct conductors: first, because it is simple; second, because it is strongly supported by analogy when compared with wave propagations in other departments of science; third, because it appears to be in harmony with a large number of recognized physiological facts, which seem inexplicable upon the theory of distinct conductors."

PHYSICS OF ARCTIC ICE IN SCOTLAND.

Mr. Robert Brown, in a paper upon the "Physics of Arctic Ice," especially as relating to Scotland, sums up as follows: First, after the tertiary period the country was covered over with a great depth of snow and ice, very much as in Greenland at the present day, but possibly some of the mountain-tops appeared as islands. During this and the subsequent period glaciers plowed their way down from the inland ice, and icebergs broke off and reached the sea through the glens, then ice fiords. Second, after this the country sank gradually, as Greenland is now sinking, to the depth of several hundred feet; and during this period most of the laminated fossiliferous clays were formed. During this period boulders were deposited from the icebergs, and other floating ice drifted both from the north and south, as was also the case during the former period. Third, the country seems then to have emerged from the water, but no doubt slowly, until the glaciers finally left the country. Fourth, by this time the country was much higher than now, and the land being connected with the continent, the bulk of the present flora and fauna crept into it from various quarters, though the Alpine plants still kept possession of the higher mountain regions during a great portion of this epoch. Fifth, a depression now took place, and the estuarine beds, or *carses*, of the Scotch rivers were formed. Much of the fossiliferous boulder clay, formed as he has described it, is now under the sea, off the coast remains of its fauna being continually dredged up. Man had also by this time got into the country. Sixth, the land after this seems to have risen, in all probability, to its present altitude, for we have no certain evidence that since the dawn of history there were any oscillations of level.

SCARCITY OF REMAINS OF THE UPPER JAW OF MARSUPIALS.

A large number of fossil mammals are only known from the teeth and bone of the lower jaw, these being preserved when no other trace (of the head at least) remains. This is especially

the case with the small marsupial mammals, found in the mesozoic rocks of Great Britain, where, out of ten genera and twenty-five species, based upon numerous specimens, not more than half a dozen series of teeth of the upper jaw have been discovered, and no crania.

VERTEBRATES OF AUSTRALIA.

According to Dr. Krefft, the well-known curator of the Australian Museum at Sydney, the vertebrate fauna of Australia, recent and fossil, foots up 133 mammals, 670 birds, 150 reptiles, 42 batrachians, and 440 fishes; making a total of nearly 1500 species. Of the mammals, 110 are marsupials, and 30 are rodents. Of parrots, 60 species are enumerated; no woodpeckers, humming-birds, or trogons being met with. Reptiles are abundant, embracing one species of crocodile, which often attain a length of thirty feet. Of 80 known species of serpents only five are poisonous, and those not so dangerous as the common English viper, and much less so than the American rattlesnake or copper-head.

CLEANING DIATOMS.

An improved method of cleaning and bleaching diatomaceæ is stated by Dr. Maddox to consist in dissolving forty grains of crushed chlorate of potassa in water, with the addition of one and a half drams of hydrochloric acid, the whole to be placed in a three-ounce vial, and closed with a wax cork. The diatoms are to be immersed in this for a suitable length of time, and subsequently washed out with clean water.

FUNGI IN POTABLE WATER.

Professor Frankland has lately been renewing the experiments of Dr. Heisch in regard to the development of fungi in drinking-water, in the course of which he found that when sugar is added to waters contaminated with sewage a fermentation ensues, with a rich growth of fungi. Meeting some unexpected exceptions, however, in the course of his investigations, to the result indicated above, he instituted a series of experiments, and finally deduced the following general results, according to the *Chemical News*:

1. Potable waters mixed with sewage, urine, albumen, and certain other matters, or brought into contact with animal charcoal, subsequently develop fungoid growths when small quantities of sugar are dissolved in them, and they are exposed to a summer atmosphere.

2. The germs of these organisms are present in the atmosphere, and every water contains them after momentary contact with the air.

3. The development of these germs can not take place without the presence of phosphoric acid, or a phosphate, or phosphorus in some form of combination. Water, however much contaminated, if free from phosphorus, does not produce them.

ASPHALT FOR PAVING.

The subject of the best material for paving streets is, of course, one of great importance to all the larger towns and cities, and the favorite at this time in London seems to be asphalt. The London *Mechanic's Magazine* is inclined to believe that experiments now being made in London will have a satisfactory result, although it thinks that a heavy bed of concrete, of at least

six inches or more in thickness, should be first laid in the more frequented streets of the city. Over this a thickness of two or three inches of asphalt is thought to be sufficient. For small towns both the layer of asphalt and of subjacent concrete may be considerably less in thickness; perhaps not more than half of that suggested.

TEST FOR BENZOLE.

For distinguishing genuine benzole, or that made of coal tar, from that prepared from petroleum, Brandberg recommends us to place a small piece of pitch in a testing tube, and pour over it some of the substance to be examined. The genuine will immediately dissolve the pitch to a tar-like mass, while that derived from petroleum will scarcely be colored.

APCENITE, A NEW BUILDING MATERIAL.

A new building material, called *apcénite*, has lately been introduced into the market, as manufactured by the Patent Concrete Stone Company, at East Greenwich, England. This, an artificial granite or marble, is concreted in a mould by the action of chloride of calcium and water-glass, combined with a body of Derbyshire spar or other material. It hardens quickly, and attains an ultimate crushing strength of three tons per square inch, equaling that of granite. It exhibits perfect sharpness and delicacy of moulding, besides admitting an exquisite degree of polish. It is also said to be unaffected by exposure to the weather or by acids, and to be produced at a less cost than scagliola or enameled slate. The same company manufactures a silicious paint, consisting of water-glass, or silicate of soda, combined with steatite, clay, or other incombustible element, and a coloring medium. This dries quickly, with a hard surface and good, clear body color, and possessing extraordinary power of resistance to fire. In one experiment the boarding and roofing of the wooden structures, which were set on fire, had been covered with the silicious paint, which was exposed to the full force of the flames twenty minutes; and though the paint blistered and perished, it effectually preserved a large extent of wood-work from injury.

PINCUS ON HAIR DISEASE.

Dr. Pincus, of Germany, has just published the results of ten years' observation upon the rise and progress of the chronic diseases of the human hair. Among other conclusions, he informs us that in most cases all these diseases begin with a shortening of the typical length of the hair, this generally taking place in such a manner that in each single cluster of hairs (hair circle, as he calls it), whenever one hair is attacked by the disease the other hairs in the group follow at a greater or less interval. If the hair first attacked is shortened to the amount of one-half its original length, a thinning of the hair immediately follows. In single cases, especially at the beginning of an attack of sickness shortly after puberty, both a shortening and thinning of the hair may occur simultaneously. This period of the course of the disease, in which the hair only fails in typical length, Dr. Pincus calls the first stage of chronic hair sickness. This first stage has hitherto remained completely unnoticed, and disease of the hair has only been appreciated when a considerable falling out

or a reduction in the diameter of a portion of the hair has taken place.

In the treatment of chronic diseases of the hair, examination of the daily loss furnishes the most important means of determining whether the evil is increasing or diminishing. Without this guide it is difficult to appreciate the changes, excepting at intervals of three months, while the daily fall of hair furnishes an indication from week to week.

According to our author, the principal constants, from the practical examination of which satisfactory deductions can be made of the rise and progress of chronic disease of the hair, are, first, the daily falling out, especially the number of hairs, and their length; second, the number of these that exhibit a distinct tip; third, the number in which a distinct root is wanting; fourth, the number of hairs with thinner and lighter roots; fifth, the number of hairs in which the diameter is less than the average. In the case of a lady of thirty-five, of average health, the daily loss of hair was found to amount to about 73, or 220 in three days; of which 162, or 74 per cent., exhibited distinct tips. In 10 hairs there was no distinct root; and the ends of the root were unchanged in color and thickness in 27 hairs under six inches in length, and in 37 over six inches long.

SILK-WORM REARING IN CALIFORNIA.

Parties in California have for some years found it to their interest to engage in the production and exportation of silk-worms' eggs, for the purpose of supplying Italy and France with healthy worms; as, until quite recently at least, the worms hatched from Californian and Japanese eggs were less liable to the many diseases that had rendered the cultivation of native eggs in Europe so uncertain. It seems, however, that, owing to the interruption of the silk-worm industry caused by the war, there is little demand for these eggs, and that dealers have a large stock on hand, for which, at present, they find no market. There is said to be a similar surplus in Japan, for the same reason. The California papers are, therefore, urging upon the citizens of the State to undertake the rearing of the worms themselves, and the production of silk.

CÆRULEIN, A NEW COLORING MATTER.

A new coloring matter, named cœrulein, is announced by Baeyer as obtained from crystals of gallein, first produced from pyrogallie acid. If this substance be dissolved in sulphuric acid it furnishes an olive brown color, with aniline a rich indigo blue, and with alkalies a fine green. These colors are readily taken up by cloth, and are quite durable.

RATS IN THE LACCADIVE ISLANDS.

We have already referred to the efforts made in the French West Indies to exterminate or reduce the numbers of poisonous serpents abounding in those islands, principally by the introduction of the mungoose, and by allowing the common hog to run wild. A similar attempt at antagonizing an inconvenient development of animal life, in the form of droves of rats, has lately taken place in the Laccadive Islands, a group situated in latitude 12° north and longitude 2° east. These are coral islands, in which the rats were not

indigenous, but were introduced by their escaping from certain vessels wrecked on the shores. They have now multiplied to an enormous extent, and have become most inconvenient pests. On one of the islands, where a few years ago thirty or forty thousand eggs of gulls could be gathered in a few hours, the birds have been entirely exterminated or driven away by their four-footed enemies.

The use of dogs being inadmissible on account of the religious prejudices of the native inhabitants, the experiment was made of transporting fifty mungoose, which were placed on some of the islands, and fifty East Indian snakes, which were introduced on others, the two not being brought together on account of their mutual antipathy. It is expected that both will multiply in the course of a few years so as to thin out or exterminate the rats; and as the serpents are perfectly harmless, it is not believed that their presence in any number will be at all injurious, especially as in the absence of abundant prey they would starve out in a short time. The mungoose, again, being a conspicuous animal, can be easily reduced in number or entirely destroyed when their services cease to be of use, their habits also being such as to keep them more readily under the eye and control of man, thereby enabling him to destroy them at pleasure.

PARKES'S IMPROVEMENT IN THE MANUFACTURE OF STEEL AND IRON.

Since the improvements made by Martin, Siemens, Bessemer, Heaton, and others in the methods of purification of iron and the manufacture of steel, much ingenuity has been expended in perfecting the various processes; and among others engaged in such experiments is Mr. Parkes, the discoverer of the substance known as Parkesine. This gentleman has just patented a process the special object of which is to purify iron from sulphur and phosphorus, which is accomplished by injecting into it, when melted, compounds of chlorine or fluorine. By melting the wrought iron with carbon, together with some chlorides and alkalies, it is converted into steel. It is stated that the method is one that promises valuable results in its application to use on a large scale.

PRIZE FOR RHEA FIBRE MACHINES.

According to *Nature*, the time for the trial of machines for separating the fibres of the rhea plant, which are to be sent in for competition for the prize of \$25,000, offered by the Indian government, has been postponed till April, 1872. It is requested that notice of intention to compete be given. Arrangements have been made to supply those who propose to become competitors with some of the plant for experiment.

PRINTING ON TIN.

A method of printing on tin is now used very largely for labeling boxes and other vessels, so as to avoid the necessity of affixing paper labels, which are so liable to come off. The colors adhere with such tenacity that the tin may be wrought into any desired shape after the printing has been accomplished. The establishment where this printed tin is worked up also has a method of lining tin canisters with a solution of silica, which produces a coating favorable for the preservation of fruits or articles that contain acids.

Editor's Historical Record.

UNITED STATES.

OUR Record is closed October 25.—The Massachusetts Republican State Convention, at Worcester, September 27, nominated William B. Washburn for Governor. Washburn obtained 607 votes and Butler 460. Among the resolutions adopted was the following:

Resolved, That the Republican party of Massachusetts is mindful of its obligations to the loyal women of America for their patriotic devotion to the cause of freedom; that we rejoice in the late action of the State Legislature in recognizing the fitness of women for public trusts; and that, in view of the great favor which the movement has received from many of the Republican party, the subject of suffrage for women is one that deserves most careful and respectful consideration.

The New York Republican State Convention met at Syracuse September 27. On the 28th G. Hilton Scribner was nominated for Secretary of State, N. K. Hopkins for Controller, Thomas E. Raines for Treasurer, and Francis C. Barlow for Attorney-General.

The New York Democratic State Convention met at Rochester October 4, and on the 5th nominated Diedrich Willers for Secretary of State, A. P. Nichols for Controller, W. H. Bristol for Treasurer, and M. B. Champlain for Attorney-General.

The Democratic State Convention of Illinois, at Springfield, October 4, nominated S. S. Hayes for Congressman at large.

The elections in Texas, early in October, resulted in a decisive Democratic victory, by a majority of 40,000.

The October elections, with the exception of those in Texas, resulted favorably to the Republican party. In the Connecticut town elections the Republicans secured increased majorities, and carried large cities which have hitherto been regarded as Democratic strongholds. The Ohio election, October 10, resulted in a majority of over 25,000 for E. F. Noyes, the Republican candidate for Governor. Last year the Republican majority was nearly 14,000. In Pennsylvania, October 10, the Republican majority was 10,000. The election was for Auditor, Surveyor-General, and members of the Assembly. The majority for Stokely, the Republican candidate for Mayor of Philadelphia, was over 8000. In Iowa, the same day, the Republican candidate for Governor, C. C. Carpenter, was elected by a large majority.

On the 9th of October the people of Rhode Island voted upon three proposed amendments to their Constitution. First, to remove the real estate qualification from foreign-born citizens; second, to abolish the registry tax; and third, to prohibit the appropriation of public money to sectarian schools. All these propositions failed—the first and second being rejected by large majorities; and the third, although it received a majority of the votes cast, lacked the necessary three-fifths, and was consequently defeated.

Brigham Young was arrested in Salt Lake City, October 2, for polygamy.

The Hon. W. H. Seward returned to this country from his travels around the world October 3.

The Hon. Sylvester Mowry, of Arizona, au-

thor of "The Geography and Resources of Arizona and Sonora," died at London, England, October 17.

DISASTERS.

A fire in San Francisco, September 23, destroyed eight stores on Market Street, involving a loss of a million dollars.

On Saturday night, October 7, a fire broke out in Chicago which proved to be the most destructive conflagration in the history of this country. The fire devastated a district of four and a half miles in length by a little over a mile in breadth, covering between two and three thousand acres, including the main business portion of the city, and involving a pecuniary loss of between \$200,000,000 and \$300,000,000. About eighteen thousand buildings of all descriptions were destroyed, of which fifteen hundred were large and substantial business houses. Over one hundred thousand people were rendered homeless and destitute. Governor Bross says: "It is safe to say that all that remains of Chicago is not worth half as much as the fire has destroyed. All our banks; all our largest and best hotels, and a score or two of lesser note; all our largest and leading grocery, jewelry, dry-goods, hardware, clothing, and other business houses; all of our newspaper offices; most of our churches and school-houses; our Historical Society's building, with all its valuable treasures, the Library Association containing, among other works, some three thousand volumes of the Patent-office reports of Great Britain; thousands of dwellings; the homes of the rich, filled with priceless treasures, and with heir-looms of hundreds of years; and the abodes of humble poverty by the ten thousand—all, all have been swept as by the fell besom of destruction from the face of the earth. Only a single house on the north side of the river—that of Mahlon D. Ogden, Esq.—is left standing; and probably seventy-five thousand people spent the morning and most of Monday crouching in Lincoln Park, or half immersed in the waters of the lake, to save themselves from the heat and the showers of burning cinders driven upon them by the tempest." There can be no accurate estimate of the number of lives lost. Within ten days after the fire over five million dollars were subscribed for the relief of the suffering.

Scarcely less memorable as regards the loss of property, and far more horrible in the destruction of human life, are the fires that since the beginning of October have raged in Northern Wisconsin, Michigan, and Minnesota. Over fifteen hundred men, women, and children have been burned to death in Wisconsin alone. Seven counties in that State were thus in great part desolated. Not only did the inhabitants lose their houses, barns, lumber-mills, and crops, but the very soil was burned. The fate of Peshtigo, Wisconsin (October 8), was simply terrible. The little town was utterly destroyed, and between 600 and 700 people, unable to escape, perished in the flames. The same night the flourishing town of Manistee, Michigan, was almost obliterated, involving the loss of a million

dollars above insurance, and the destitution of hundreds of the inhabitants.

CENTRAL AMERICA.

Advices from Mexico announce the election of Juarez for President by Congress, he receiving all the votes cast—118 in number.

A telegram from Kingston, *via* Havana September 26, announced the wreck of a cooly vessel from India for Martinique. Two hundred bodies had been washed ashore at Martinique.

EUROPE.

The elections of members of the French Chambers have resulted in a victory for the present government. The radical republicans carried the great cities of Lyons, Marseilles, and Toulouse. The conservatives were successful in Paris. The Bonapartists secured a small delegation, and succeeded in electing Prince Napoleon. The Orleanists elected the Duc d'Aumale. Gambetta, Picard, and Forcade were defeated.

The sentence of Henri Rochefort, in whose behalf M. Victor Hugo appealed to M. Thiers, has been commuted from penal servitude for life to banishment from French territory.

The Alsace-Lorraine customs treaty between France and Germany was signed October 13. By this treaty Germany cedes back to France a small strip of territory. It provides for the payment of the remainder of the war indemnity (three and a half milliards of francs) in specie bills—eighty millions every fortnight, beginning January 15, 1872. It provides also for the evacuation immediately of six French departments now occupied by German troops. Thirty thousand German troops are to remain in France pending the liquidation of the indemnity; but it is agreed that if the terms of the convention are faithfully carried out, this number will be materially reduced at the expiration of six months from the signing of the treaty. The convention regulating customs provides that the product of Alsace-Lorraine shall be permitted to enter France, and those of France to enter Alsace-Lorraine, free of duty for the next twelve months.

The second session of the German Reichstag was opened October 16 by the Emperor in person, who in his speech recommended a change of coinage, and the establishment of a direct communication with Italy through Switzerland by means of the proposed St. Gothard Tunnel.

In the Bavarian Parliament, October 14, the Minister of Public Worship and Instruction, in reply to the large number of interpellations which had been placed on the books of the deputies regarding the actual state of the relations which exist between the government and the Holy See, said that "the state had at all times the right to make changes in the laws relating to the church. The church having declared a change of principles, and infallibility being a doctrine dangerous to the state, the government had resolved to protect any and all of its citizens who could not accept the infallibility of the pope as an article of faith. The government would still consider such persons as Catholics, and it would oppose any encroachment by the church upon the principles of the civil constitution." The minister also declared that "the sentiment of the king and the Council of State favored a separation of the

religious and political branches of the government, and the complete independence of each."

A London telegram, October 17, reports, through advices from Odessa, that eight hundred buildings in the town of Bogoozlav have been burned by incendiary fires, believed to be the work of fanatical native oppressors of the Jews.

An explosion of fire-damp in one of the mines in the canton of Grisons, Switzerland, September 28, resulted in the death of thirty persons.

The London *Army and Navy Gazette* of September 2 published the following summary of the military forces of Europe, the estimate being for the actual force of each nation in time of war:

RUSSIA.—47 divisions of infantry and 10 of cavalry, 8 brigades of rifles and reserve, 149 regiments of Cossacks, 219 batteries of artillery, and 50 of mitrailleuses, making altogether 862,000 men, 181,000 horses, and 2084 guns. (This includes the troops in the Caucasus, Siberia, and Turkestan.)

GERMANY.—18 corps, including 37 divisions of infantry and 10 of cavalry, and 337 batteries of artillery. This force numbers 824,990 men, 95,724 horses, and 2022 guns.

AUSTRIA.—13 corps, including 40 divisions of infantry and 5 of cavalry, and 205 batteries of artillery and mitrailleuses. The total force is 733,926 men and 58,125 horses, with 1600 guns and 190 mitrailleuses.

ENGLAND.—Army in process of reorganization.

TURKEY.—6 corps of Nizam (regulars), 12 corps of Redifs (reserves), and 132 batteries; 253,289 men, 34,835 horses, and 732 guns.

ITALY.—4 corps, with 40 infantry and 6 cavalry brigades, and 90 batteries. Total force, 415,200 men, 12,868 horses, and 720 guns.

FRANCE.—10 corps, with 32 infantry and 12 cavalry divisions, and 140 batteries. Total force, 456,740 men, 46,995 horses, and 984 guns (including mitrailleuses).

BELGIUM.—145,000 men, 7000 horses, and 152 guns.

HOLLAND.—35,383 regulars, 87,000 militia, 5200 horses, and 108 guns.

SWITZERLAND.—160,000 men, 2700 horses, and 278 guns.

ROUMANIA.—106,000 men, 15,675 horses, and 96 guns.

SERVIA.—107,000 men, 4000 horses, and 194 guns.

GREECE.—125,000 men, 1000 horses, and 48 guns.

SWEDEN (including Norway).—61,604 men, 8500 horses, and 222 guns.

DENMARK.—31,916 men, 2120 horses, and 96 guns.

SPAIN.—144,938 men, 30,252 horses, and 456 guns.

PORTUGAL.—64,390 men, 6320 horses, and 96 guns.

From the above data it appears that the total of the forces available for war purposes in Europe—taking the English disposable force at 470,779 men and 336 guns—is 5,164,300 men, 512,394 horses, 10,224 guns, and about 800 mitrailleuses.

Charles Babbage, the great mathematician and philosophical mechanist, died in London October 20, aged seventy-nine years.

Sir Roderick Murchison, of London, one of the most eminent scientists in Europe, died October 22, in his eightieth year.

ASIA.

A dispatch from Calcutta, *via* London September 25, announced the wreck of a steamer on the coast of India, and that 138 natives lost their lives.

In addition to the sufferings endured by the people of the province of Khorassan, Persia, from famine—the loss of life from hunger in a single month amounting to 8000 persons—the Afghans have made a military raid into their territory, and carried 40,000 of the inhabitants away to slavery.

Three thousand lives and an immense amount of property were lost by recent storms and floods in China.

The Japanese government has abolished the order of the Daimios, reducing the members of the order to a common level with the people, and confiscating their estates.

Editor's Drawer.

THE following puts the matter of "calls" in a fresh light. A good Scotchwoman, Janet Halliday, was much distressed when she heard that her parish minister, the Rev. George Barclay, was to remove from Hutton to the charge at Haddington. Meeting him one day, she said,

"Oh, Maister Barclay, what for are ye to leave the folks o' Hutton, wha wad sae fain keep ye?"

"I am obeying a call of Providence," said Mr. Barclay.

"Aweel, aweel!" said Janet, "and Providence is unco kind to ye a', for He never ca's ye to a waur stipend!"

THE Rev. Sir Henry Moncrief was collector for a charitable society in Scotland, known as the Ministers' Widows' Fund. Having reproved a Highland minister for being considerably behind in the payment of his rates, he was met with the retort, "Sir Harry, if you're an anointed minister of the Word, you have been anointed wi' vinegar."

THE recent arrival here of the son of the Emperor of all the Russias recalls an anecdote of a Scotchman on the advent in that country of another royal Russ. While surveying the west coast of Scotland, Captain Robinson had received on board his ship the Grand Duke Constantine. As the duke could only remain a very short time, the captain resolved to show him as much as possible during his brief stay. Accordingly he steamed to Iona on a Sunday, believing that day especially suited for pointing out to his royal visitor remains associated with religion. Landing on the island, he waited on the custodian of the ancient church with the request that he would open it.

"Not so," said the keeper; "not on Sunday."

"Do you know whom I have brought to the island?" said the captain.

"He's the Emperor of a' the Russias, I ken by the flag," responded the keeper; "but had it been the Queen hersel', I wadna gi'e up the keys on the Lord's day."

"Would you take a glass of whisky on the Sabbath?" inquired the captain.

"That's a different thing entirely," said the keeper.

THE following, from a Scotchman, by way of illustrating the kindly consideration evinced by the Scottish peasantry toward the domestic animals, especially the shepherds to their dogs, which consequently become their attached companions. A minister calling to visit one of his flock found before the fire-place three dogs, apparently asleep. At the sound of a whistle two rose up and walked out; the third remained still.

"It is odd," said the minister, "that this dog does not get up like the others."

"It's no astonishin' ava," said the shepherd; "for it's no his turn; he was oot i' the mornin'."

A gentleman staying in the family of a sheep-farmer remarked that daily as the family sat at dinner a shepherd's dog came in, received its portion, and soon after disappeared.

"I never see that dog except at dinner," said the visitor.

"The reason is," said the farmer, "we've lent him to oor neibour, Jamie Nicol, an' we tell him to come hame ilka day to his dinner. When he gets his dinner, puir beast, he gaes awa back till his wark."

A FRESH and good thing of Carlyle's.

Traveling north during the past summer in a cart, comfortably, with aristocratic traveling companions, conversation turned upon Darwin and his theory. The ladies argued the *pros* and *cons* in a womanly manner, looking to Mr. Carlyle for approval. He gave every *faire ladye* the same kindly nod and smile, no doubt remembering Josh Billings's saying, "Wooman's infloence is powerful—espeshila when she wants enny thing." One of the party, after she had *given out*, said,

"What do you think, Mr. Carlyle?"

His cool reply was,

"Ladies, you have left nothing to be said."

"Oh yes! but what is *your* opinion? you have not given us that."

Carlyle was too far north to be sold. His pithy reply was,

"For myself, I am disposed to take the words of the Psalmist, 'Man was made a *little* lower than the angels.'"

A BOSTON medical man sends us the verdicts of coroners' juries in two cases, as evidence that even in the near vicinity of the modern Athens men may be found who are liable to what may be called "temporary confusion of intellect:"

No. 1.—"We find that John Wilson came to his death from some cause to the jury unknown; but, from the evidence, the jury are of the opinion that his death was accidental."

No. 2.—"The jury find that Mary Jones came to her death from blows inflicted by her husband, John Jones, and partly from the excessive use of intoxicating liquors; the first mentioned cause operating, in our opinion, to cause a fatal result, partly in consequence of the second."

FORTY years ago there was born in the city of Philadelphia a child who, from that time forth, has been known to the Western world as Ignatius Donnelly. After graduating at the High School of his native city he studied law, was admitted to the bar, emigrated to Minnesota, and was elected Lieutenant-Governor. In 1862 the people sent him to Congress, where he served three terms. Having bolted from his party, he was relegated to private life; but a few weeks ago, having returned thereto, and having fresh political aspirations, he aired a speech, from which we quote this paragraph:

"A good deal has been said about my returning to the Republican party. I do not feel that I ever was out of that party. I may have got one leg over the traces, but I was in the harness all the while. [Great laughter.] If there was any crime in kicking that leg out of the traces, my defense will have to be that of the boy who went fishing on Sunday. A preacher saw him sitting on the river's bank. 'My son,' said he, 'don't you know you are committing a great sin to fish on the Sabbath-day?' 'Wa'al,' said the boy, 'it can't be no great sin, for I hain't kotched

nuffin.' [Uproarious laughter.] I ran upon 'the platform of Ignatius Donnelly.' I still regard it as a good, sound, substantial platform, but there isn't enough of it to make a party out of. [Tumultuous applause.] In fact, my friends, I found that the temperature was increasing at the rate of one degree for every fifty-four feet I descended. It got so hot I concluded I was going to the devil. [Laughter.] Now I don't think that a man ought to go to the devil simply to prove that he isn't afraid to go to the devil. So I took the back track. I came up like a half-drowned gopher." [Tremendous outburst of laughter.]

THE missionaries of the American Sunday-School Union, in their exploring and pioneer work, meet with some queer experiences, and encounter some strange opposition, as recent numbers of the *Drawer* have recounted.

One in Indiana was urged by Judge S—— to visit G—— Township, in which there was not a single Sunday-school; but advised, at the same time, that it was at the risk of his life. He visited the place and addressed the people. One man replied, "I'm one of them fellers that's opposed. The Sunday-schools has tore the government to pieces, and I'd like to tear them to pieces." A young man, hearing that the missionary was kicked by his horse, said, "It's a — pity the horse hadn't killed him, and saved me the trouble." The missionary established a school there, and these men are now his fast friends.

A respectable physician told the missionary that when he first visited G—— with his wife, after calling in vain at four houses for refreshment, his wife suggested that if denied at the fifth he should ask "if there were any *Christians* in the place." He did so, and was answered by an old lady who sat smoking in the chimney-corner, "There was two young fellers come over here from Kentuck that had it, *but they both got well.*" There are now seven flourishing Sunday-schools in that township.

Some oppose mission Sunday-schools from political suspicion: "It's just an abolition scheme to 'lect old Grant ag'in." One man proved it would "come to somethin' bad, because down in Martin County, where his brother lived, they got up the same kind of a school, and the last one that tuk hold of it was a Knight of the Goolden Circle; and he just believed the missionary was goin' round startin' up them Goolden Circles ag'in to bring on another war."

Some oppose from anti-temperance hate. A mother said: "I'd like mighty well to have a Sunday-school for my young uns, but my old man's afeered of it, because somebody asked the missionary to drink whisky at the still-house, and he wouldn't tech it. He says he don't like to give up his liberty, 'cause he likes to take a little his self onst in a while."

In an English magazine we find the following anecdote, which will be appreciated by readers of the *Drawer*: A certain widow was one day in spring seen by the clerk of her parish crossing the church-yard with a watering-pot and a bundle.

"Ah, Mistress Mactavish," said the clerk, "what's yer bus'ness, wi' sic like gear as that y'are carryin'?"

"Ah, weel, Mr. Maclachlan," replied the wid-

ow, "I'm just goin' to my gudeman's grave. I've got some hay seeds in my bundle, the which I'm goin' to sow upon it; and the water in the can is just to gi'e 'em a spring like!"

"The seeds winna want the watering," rejoined the clerk; "they'll spring finely o' themselves."

"That may well be," rejoined the widow; "but ye dinna ken that my gudeman, as he lay a-deeing, just got me to make promise that I'd never marry agin till the grass had grown aboon his grave. And, as I've had a good offer made me but yestreen, ye see, I dinna like to break my promise, or to be kept a lone widow, as ye see me!"

The minister's aid-de-camp looked on the widow indeed with a mirthful expression.

"Water him well, widow," said the clerk; "*Mactavish aye was drouthy!*"

SOMETHING of the same nature occurred nearer home quite recently: A certain goodwife who had been lecturing her husband for coming home intoxicated became incensed at his indifference, and exclaimed:

"Oh, that I could wring tears of anguish from your eyes!"

To which the hardened wretch hiccupped, "Tai-'tain't no use, old woman, to bo-bore for water here!"

How gratifying it must have been in Mons. Louis Le Petre, "Violinist and Prompter," to be able to put his best foot forward, and inform his many acquaintances and the dancing public generally, through the columns of the *Chicago Tribune* of September 24, "that, having recovered from the temporary illness occasioned by the *brilliant and eminently successful surgical operation on his right leg*, performed by Dr. Bolus, he will continue to furnish music for balls, parties, etc., at the most reasonable rates *compatible with excellence!*"

COURT-ROOMS are almost daily the scene of some pleasantry of Court or counsel. In a bankrupt case recently, where a merchant named Homer petitioned for a discharge from his liabilities, the following epigram was made:

That Homer should a bankrupt be
Is not so very Odd-d'ye-see,
If it be true, as I'm instructed,
So Ill-he-had his books conducted.

THINK of the man who could plant little shrubs on the grave of his wife, and then write a verse like this!

I plant these shrubs upon your grave, dear wife,
That something on this spot may boast of life:
The shrubs may wither, you in earth must rot;
They may revive, but you, thank God, can not.

JUST now, when there is so much appearing in print about the mental and physical state of the Queen, and so much said about the Prince of Wales, it comes pat to reproduce a witticism that was got off at the table of Barham, author of the "Ingoldsby Legends," on the christening of the Prince, on the 25th of January, 1842. Barham had been to see the illumination, and remarked that at almost every window he noticed the letters "A. E."

"Ah!" replied a gentleman, "he'll make ac-

quaintance with the other three vowels before he comes of age."

Unlike some of his royal predecessors, the witticism has not, in the Prince's case, proved true. Whatever else may be laid to his charge, he has not called upon Parliament to pay any of his little bills.

IN these days of frequent divorce it may not be malapropos to quote from a recent English book a good anecdote of Opie and Godwin. Opie was divorced from his first wife, and Godwin was an infidel. They were walking together near St. Martin's Church.

"Ha!" said Opie; "I was married in that church."

"Indeed!" said Godwin; "and I was christened in it."

"It is not a good shop," replied Opie: "*their work don't last.*"

ONE of the pleasantest of later biographies is that of Sir David Brewster, by his daughter. Probably the idea of writing poetry was as far from him as it could be from an Iroquois. Yet there is a single instance recorded of his soaring into poesy, at the age of eighty. A charming young lady, Miss Phœbe L——n, begged that he would contribute some lines to her album. In vain did the philosopher protest that verse-making was not his forte. The lady would admit of no excuse; so Sir David snatched a pen and wrote thus:

Phœbe,
Y'be
Hebe.
D. B.

THE Drawer is quite sure that the following letter from "a child of nature," who dwells in Tennessee, will be read with pleasure by young ladies and gentlemen just entering into society. That no one's feelings may be injured, we alter names. Otherwise we publish verbatim:

DEAR ANNIE,—I received your letter not long since it was received with great joy. I had almost concluded you had forgotten your friend Susie but was convinced *you* had not forgotten Bob. I have no nucs that is interesting. I have enjoyed my—self finely sinc school. though my pleasure is sometimes mingled with pane, If I do not get to meet my sweetheart *every week* it near bouts breaks my heart. Annie I have a very *nice* time I go a fishing and to see my sweetheart you know. I was at picnic the 4 of July. I enjoyed myself in company the most *ex-quis-itely well*. Annie I must confess that I met *those* on the said occasion. their was *one* yong gentleman their which I took a *particlier* fansy. I will describe him then, I *no* you will not blaim me. he is Just at the age of 19. in his continance intelligence is *deeply deplaced*. on his cheeks the peach blossom buds its coloring. around his nec awburn har falls in great profuseion. his form is that of a Venus Medica: his sweet voice which was *indeed* anuff to enchant eny one, accompany by the gitar mode of music fit only for angles. I have *toled you anuff* about my sweetheart. And now about *your* sweetheart Bob. You neednt have eny fears about Loiza Burbanks cuting *you* out. No *sir-ree*. I must tell you a big thing about Bob. he has professed religion. they had a grate time. Annie you do not know *how* he has changed. he dont look like the same boy. he looks like he never did eny harm in his life and toled me this morning he loved you better than *eny person on earth*. *You bet*. Their is a tiptop meeting goin on in the villeg. it has been goin on a week and thay dont no when it will clothes, they have about 30 morners and agrait meny has professed. Jim Watson, Lou Toles, Sandy Weatherberry, Fan Stickney, and Ellick Smith has professed. They went for Joe Harberg and fetched him the first pop. I liked to forget that Frankie Simpson and I

was morners. I heard from Miss Barnes to-day. she is flying a round at a grate rait. Since Euphemy Powers has gone to school she feels ellivated to the ex-stream of humman happiness. I havent pascience to write eny more. but dont you never go back on this child thats all. Your tru friend SUSIE.

THE author of "Ginx's Baby" was recently retained by the Aborigines Protection Society and the Antislavery Society, of London, to visit Demerara and examine into the condition of the fifty thousand coolies and Chinese who had been imported there as laborers by British landowners. The result of his investigations he has recently published in a volume entitled, "The Cooly." On board the vessel on the voyage out were several odd characters; among them an honest, quaint fellow from Lima, who told the following:

"Last time I came out—eh? there were three bishops and about twenty ecclesiastics—eh? going to the council. There was great fun—eh? The Archbishop of —— was one—eh? He was a comfortable little man—eh? He liked well his glass—eh? One Sunday morning there was a service, and he was to preach—eh? I happened to go down to the saloon, and the archbishop and one of his priests, his secretary—eh? were sitting, taking something out of a bottle—eh? I spoke to him, and he said, 'This is a most delicious drink; I have never tasted it before.' I said, 'What is it?' 'Whisky.' 'Oh,' I said, 'whisky; I know it very well.' They were drinking it neat—eh? I called for *another* bottle, and mixed some for them—eh? and we finished the bottle. You should have seen the archbishop—eh? He could scarcely stand up for the service, and when the time came to give the sermon, he had to take hold of the bench and go along, so—eh? He could only say a few sentences—eh? He went to his cabin, and we never saw him again during the voyage—eh? The captain was a jolly fellow—big, fat, full of fun; and every morning he used to say to the ecclesiastics (he talked Spanish well), 'Ah! his grace the archbishop, how is he to-day? Is his grace still *mareado*—eh?' You know *mareado* is Spanish for *seasick*; but then it also means sometimes what you call *tight*—eh?"

NOT long before the flight of Napoleon III. from Paris, his cousin, Prince Napoleon, who bears a marked resemblance to the first Bonaparte, and who was always jealous of the Emperor's good luck, said to him, petulantly, "Come, now, you have nothing of your uncle about you!" To which Louis Napoleon promptly and sarcastically replied, "Pardon! I have all his family on my hands."

APPROPOS of the recent session of the General Convention of the Episcopal Church at Baltimore is this: The Scottish peasant will faithfully obey his master, who must not, however, interfere with his religious belief. A Northern landowner had erected on his estate a place of worship for members of the Episcopal Church, and had thereby unconsciously excited among his people some unpleasant misgivings. Soon afterward, on inspecting a newly erected sheep-pen, he remarked to a peasant who attended him that it was too extravagantly ornamented.

"'Deed is it, Sir," was the reply. "*It's owre Episcopal-chapel-lookin'!*"

THE "Art of Putting Things" is the title of one of the cleverest essays of "A Country Parson;" but quite as clever, in its way, is the art of paragraphing, which the reporters, the "personal" and the item men, seem to have adopted to give zest to their paragraphs. In a publication devoted to the great moral work of urging upon business men the importance of, and the great rewards that ensue upon, advertising, a few characteristic pleasantries are strung together, such as:

A Chicago hair-restorer agent went out into the suburbs, stuck his posters all over a church pulpit, and then asked the minister to call attention to them.

Here is a pleasant reference to an undertaker in Illinois:

An elegant stock of neat and nobby shrouds, warranted to give satisfaction to the most particular.

In a description of a Western tornado it is mentioned that

Some of Mr. Quinn's hens were subsequently discovered miles away, part of them entirely stripped of their feathers by the force of the hurricane.

Having occasion to call upon a wealthy "Southern lady of African descent," an interviewer observes that "as the lady entered the apartment she made a most impressive sweep of her ample train as she courtesied in her own elegant manner." Then he mentions what *he* did:

Recognizing the importance of the occasion, I made my best bow, *à la* Brummel, and my tired extremities swerved gracefully to the edge of a costly and sumptuous chair.

Here is a sample of incredible disrespect to our Vice-President:

Having determined to leave public life, and engage extensively in the manufacture of corrugated calico coal-hods, Mr. Colfax is able to look without personal prejudice at the political situation, and his judgment is consequently valuable.

Brief description of a prize-fight: "They met—they mauled—they mizzled."

They mauled and mashed and mangled,
And wrung and wrenched and wrangled;
They bullied, busted, basted, bled;
Their eyes were blackened, noses red;
But still they banged and bunged and bited—
These horrid-sighted pugs, benighted—
And kicked and gouged and gashed and gored,
Till from the ring one pug was bored.
Oh! I was glad when that last lunge
Made flat-nosed Bill throw up the sponge.

And here is a railway accident:

The Old South Railroad Bridge got discouraged, and lay right down with a train on it.

The manner in which a respectable man, of defective vision, came to his end is thus mentioned:

John Garder was blind of an eye, and in a moment of confusion he stepped out of a receiving and discharging door in one of our warehouses into the ineffable glories of the celestial sphere.

And how a country gentleman was startled:

Mr. M'Elsey was struck by lightning a few days since. He describes the sensation as "lying crosswise on a red-hot stove and unable to get off."

To conclude with an editor who wanted a dog, and advertised:

I will take a good dog in payment for one year's subscription.

The next day forty-three dogs were sent to the office. The day afterward, when the news had spread out into the country, four hundred farmers sent two dogs apiece by express, with eight baskets full of puppies, all marked C.O.D. The offer found its way into neighboring States, and before the end of the week there were eight thousand dogs, tied with ropes, in the editor's front and back yards. Government tax, at \$1 each, \$8000.

THE following, from a paper published in Seneca County, Ohio, shows the possibilities of poetic fancy, in that region, when spurred on by arrangements of a nuptial character:

LILLY—BERRY.—On the 27th inst., at the residence of the bride's father, by Rev. Mr. Buxton, Frank Lilly, of New Bedford, Ohio, and Ida Berry, of Republic.

It is not often that we find
A Lilly and Berry so combined
That, taken together, they form but one;
But this in Republic has been done.

Apropos of this, we see in another paper a love-inspired versifier, who, under circumstances perhaps somewhat similar, evolved the following:

I clasped her to my heart—my own!
My ecstasy no tongue could speak—
That moment I'd have scorned a throne;
When in my ear
My love, my dear,
Said, "What's your wages, Bob, a week?"

Too many stories having the name of Dr. Boggs, of Wayne County, Illinois, associated with them are in circulation "out West" to make necessary an apology for introducing him herein by name. The Doctor is a Kentuckian of the better class, and values above all things what he calls "fair play." In his younger days he was an enthusiastic fox-hunter, and many impressions then received are held by him yet, as this anecdote will show. During the summer just passed Dr. B. was chosen moderator of a religious debate in this (Wayne) county, between Elder H—, who affirmed that Joseph Smith was a true prophet, and Rev. Mr. Y—, who championed the orthodox view of the question. Rev. Mr. Y— was closing the debate, when Brother B—, who deems himself "gifted in speech" and "powerful in Scriptur," being of opinion that the "side of the Lord" had not been ably represented, sprang to his feet and demanded of the moderator permission to be heard.

Dr. B., knowing the audience to be wearied, and that Brother B— was an endless talker, said to him, "Brother B—, I shall not, of course, deny you the right to address this people if they manifest a desire to hear you; but if I am allowed to decide the question, I shall rule you out on the ground that it is too late in the chase to let in a fresh dog."

The congregation "manifested" itself by speaking right out in meeting in support of the ruling of the moderator; and Brother B— ought to have been mollified by a subsequent decision in favor of the "side of the Lord" on the merits of the discussion.

MR. DRAWER,—You have given "hard-shell Baptists" many a niche in your valuable Magazine; a Baptist with *no shell at all* now gives you a veritable incident in his history, as follows:

When I was a theological student it was expected by my teachers, and demanded by churches and pastors, that I should occasionally officiate as a preacher for some destitute church or some pastor who, for the time, might lack a prepared sermon, or be so destitute of the spirit of his calling as to wish to avail himself of a substitute, even if it were but a poor one.

It was my privilege to be visiting a venerable pastor's family where there was a lovely young daughter, a friend of my boyhood. Her father insisted I should preach for him, which I did. The congregation, as usual, was very numerous, and mostly composed of well-to-do farmers and their families. All who knew the Rev. Edward Barber, of Union Village, Washington County, New York, knew it was not his fault if his hard-working hearers sometimes took a soothing nap during the delivery of his one-hour-and-a-half sermon.

Having but little to preach, and determined to be brief, and, if possible, have the credit of preaching to a wide-awake people, and get through with the embarrassment which was so inevitable both from my extreme youthfulness and having to officiate before the eminent pastor and the flock that had become renowned for their intelligence in the Scriptures under the instructive and eloquent ministry of a preacher whose praise was in all the churches, I commenced by taking for my text those appropriate and very familiar words of my Master, where he says, "Come unto me," and discoursed on the kind invitation as well as I could.

The aged pastor rose in his pulpit after I sat down, and said to me, "Give me your watch." I complied with his request. Holding the watch before the people, he said, "Brethren, the young man has spoken only twenty minutes: will you hear me half an hour?" Many nods of the head by way of assent came from the pews; and, as the old pastor was quite deaf, he understood the significant sign, and spoke as follows:

"If ye will deal kindly and truly with my master, tell me: and if not, tell me; that I may turn to the right hand, or to the left"—the words of Eleazar, Abraham's servant, to the friends of Rebecca, whom he was soliciting to become a bride for Isaac. The good old man then said: "Our young brother is here this morning in search of a bride, and has made his errand known in the discourse he has just ended." Turning his mild eyes directly toward the pew on the right side of the pulpit, where his daughter and three other young ladies were, he added: "My dear young friends, will you go?" Pausing for half a minute, he repeated, "Will you go?" and after another pause, inquired—his eyes yet fixed on the same group—"Will you go?" After another, and to them and myself an unconscionably long pause, and an earnest look upon them and other similar feminine clusters, and with additional emphasis and fervor, he repeated, "I say, my young lady hearers, our young brother has come here to-day in search of a bride: will you go?" About this time the female group had bowed their heads very low, but whether it meant assent to the good pastor's proposal or devotional feeling I never fully ascertained. After another long pause, and an emphatic clerical *ahem!* raising his kind eyes toward the galleries, filled with youth, he repeat-

ed: "I say, my young friends, our brother has come here this morning in search of a bride, and I desire to know who among you are willing to go. I say he is here in quest of a bride;" and after another pause, he added, in suppressed tones of voice—"a bride, I say, he wants—*yet not for himself*, but for his Master. Will you go?"

This explanation somewhat relieved me from embarrassment; and, venturing to raise my eyes and look over the assembly, I found relief had come to others besides myself. From this point of suspense the "old man eloquent" proceeded to state the claims of the Master upon their affections and confidence with a power of words and forcefulness of appeal and appropriateness of illustration and application that I do not remember to have heard excelled in all the preaching to which I have listened during an experience of more than forty years.

I will only add that if any think on reading this that it bordered too much upon the ludicrous to be becoming in an aged pastor in reference to a young man's preaching, and the adaptedness of the quaint appeal to the young ladies of his charge, it will be because I can not present a true picture of the solemn gravity and benign dignity of manner of the grand old patriarch, and his unrivaled power to go so near the line of pulpit propriety, and yet never lose the faculty he possessed of holding every thought and emotion of his attentive hearers in absolute subjection to the force of solemn truths. A. D. G.

THE Reverend Mr. —, a good preacher, a zealous pastor, and devoted Christian, was in charge of the Baptist church, "endurin' of the war," in the pleasant little city of Griffin. During a protracted meeting he became deeply concerned, and urged upon all the necessity of a change of heart and life; and as an earnest of their desire therefor, if not as a means of grace, pressed them to come up to the "mourners' bench." There was much serious feeling, and many went forward in response to his invitations. As each one rose to go, Brother — would call attention to the fact, and improve the occasion by urging others to follow the example. At length a tall young man, dressed in a soldier's suit of gray, liberally bedizened with gold-lace, rose up and began to make his way past the other occupants of the pew toward the aisle. Confident he was coming up to the altar as a mourner, Brother — seized the opportunity. "And here comes another. A soldier says, '*I'll go.*' Come on, my friend, and enlist under still another banner," etc. Reaching the aisle, the "soldier" headed for the door instead of the altar; and as he passed out of sight that audience relaxed its many mouths, and came as near smiling at the ludicrous situation as propriety allowed. Ever after Brother — would not trust a soldier till he *headed the right way*.

THE anecdote in the May Drawer of Mr. Webster and his tooth-brush reminds a correspondent at Kingston, Ontario, of a little anecdote of the late Sir Alan Macnab, a Canadian celebrity. Sir Alan was traveling on one of the steamers on Lake Ontario. The state-rooms each contained two berths, and the boat being crowded, Sir Alan was allotted a cabin in which

some other person was given the lower berth. On the morning after starting, Sir Alan, having overnight placed his comb, tooth-brush, etc., on the wash-stand, was surprised, while lying in his berth, to see his fellow-passenger use his (Sir Alan's) tooth-brush; and thinking it but fair to have a joke at the man's expense, jumped out of bed, and taking a basin of water, put his feet in it, and soaping the tooth-brush, began to wash his toes with it.

"Say, stranger," cried the horrified looker-on, "you don't use that brush to clean your toes?"

"Why, what else would you suppose I use it for?" was Sir Alan's reply.

"Well, I'm darned!" exclaimed the stranger, rushing from the state-room thoroughly disgusted. The brush was given to the poor.

THIS from the "Empire State of the South:"

"Mr. C——, will you take sugar and cream in your coffee?" asked an excellent housewife of a country cousin.

"No, ma'am; I jest takes it *barefooted* and *bald-headed*."

THE very interesting article in *Harper* for October concerning the New York Post-office recalls the following address of a letter which came, and was duly delivered by your correspondent. Of course this was before our venerable Uncle required postages to be prepaid. It was directed thus:

To Merriwether County, Georgia, I am bound,
To seek my honorable hostage;
And if at Erin I am found,
E. H. Drewry will pay the postage.

And he did.

PASSING up town the other afternoon *via* the Bowery, where the saloon de lager aboundeth, we noticed a copious, healthy-looking German, who was evidently laboring under a superfluity of the beverage of that region, the same bringing to mind a verse from an old song that was popular when the writer was a lad, and true "to a dot" then as now:

Goody Burton's ale
Got into my noddle;
Being strong and pale,
It made me widdle-woddle.

CERTAINLY a large proportion and the best of the pleasantries in the Drawer come from and are about the clergy. Here is one of the Rev. Mr. —, who had taken into his service, for general utility, a poor lad, and for whose spiritual welfare he was, of course, bound to look out. Desiring one morning to put in practice his benevolent intent, he called the boy to his study, and with visage of the gravest sort said:

"Sam, do you know you are a sinner?"

"Yes," falteringly replied Sam.

"Do you know what will become of you, if you do not repent?"

Receiving no coherent reply, he launched into repentance and redemption, encouraged by the evident impression made by his words, and feeling no small compunction the while that he had so long neglected a "subject of grace" so promising. At last a vacant and wandering look roused a sudden suspicion, to verify which he inquired:

"Sam, what is a sinner?"

Imagine the situation when the "subject of grace" promptly responded:

"Sinner, Sir? Yes, Sir; sinners is strings in turkeys' legs, Sir."

The sinews of the parson's face relaxed.

LORD PALMERSTON has settled conclusively an old though trifling controversy with regard to the correct version and authorship of the epigram on the famous Walcheren expedition. In Sir Henry Bulwer's *Life of Palmerston*, vol. i. p. 117, occurs the following extract from a letter written by his lordship to his sister, the Hon. Miss Temple, dated February 27, 1810:

"Did you see the following epigram the other day in the *Chronicle*? If you did not, it is a pity you should miss it, and I send it to you; it is by Jekyll:

"Lord Chatham, with his sword undrawn,
Stood waiting for Sir Richard Strachan;
Sir Richard, eager to get at 'em,
Stood waiting—but for what?—Lord Chatham?"

CAN the imagination conceive any thing more utterly ludicrous than the following scene, described by a correspondent of that clever paper, the *Louisville Courier-Journal*? The Second Presbyterian Church of Danville, Kentucky, being without a pastor, the different ministers of the town, especially those connected with the theological seminary, preach alternately to the orphan congregation, and lately it was Dr. Yerkes's turn to deliver a sermon to a large assembly. In an eloquent oration he uttered the words of Divine truth, when suddenly—horribile dictu!—a member affected with a bad cold commenced blowing his nose most violently. A terrible blowing it was—such as you never heard before in all your life, and such as the poor doctor hopes never to hear again. It evidently had swept the whole of the beautiful sermon out of his memory, and having no notes about him, he tried, in vain, to restore the broken connection. But, alas! he could discover neither end, and the frightened doctor exclaimed,

"Brother M'Mullen, will you oblige me by repeating the text?"

The reverend brother arose, thought a while, stammered, hesitated, and sat down again. He gave it up.

"Please, will any one in the congregation let me know my text?"

After a long pause a student said, "1 Corinthians, x. 16."

Relieved from a great burden, the happy doctor opened the Bible, but only to find that it was a sad mistake.

"This is not the right one. Please, can any one recollect the text?"

A dead silence followed. Professor Beatty, of Centre College, rubbed his head in despair, but he neither rubbed the text out of nor into it. Rev. Mr. Johnson and many of his brethren, together with the whole congregation, all were unable to find the lost darling. The laughter which followed now was indescribable, and quite a time passed before the house could be called to order. It being finally restored, the doctor called on Mr. M'Mullen to close the meeting with prayer, and all adjourned, perfectly convinced that they had listened to one of the most remarkable sermons ever preached.

HARPER'S NEW MONTHLY MAGAZINE.

No. CCLX.—JANUARY, 1872.—Vol. XLIV.

THE LEGEND OF THE MISTLETOE.

“‘YOU BROUGHT THIS ROD TO BANISH A GOD,’ HE CRIED, AS HE SNATCHED IT GAYLY.”

OLD Santa Claus woke, one bright cold morn,
In righteous indignation,
And swore, in a way, we blush to say,
Was shocking beyond relation,
That he could not, would not, should not bear
This state of things any longer;
He'd soon find out, by his saintly beard,
Which, he or Cupid, were stronger!

Entered according to Act of Congress, in the year 1871, by Harper and Brothers, in the Office of the Librarian of Congress, at Washington.

Vol. XLIV.—No. 260.—11

It seems that our Saint had earthward peeped
 Through star-rifts in his palace,
 And seen a sight that with reason might
 Enkindle a good saint's malice:
 Young Love had come from his tropic home,
 With flag and banner flying,
 To boldly reign in the Saint's domain,
 All right and might defying.

The snow-drifts, catching his smile of light, with sunset hues were glowing;
 The brooklet, echoing his soft low laugh, from wintry chains was flowing;
 The icicles shone on every tree with hues of prismatic splendor;
 The very sky took a softer blue, the sunbeam a radiance tender;

But worse than all—oh, far, far worse
 Than all this tribulation!—

A dreadful spell on young folks fell
 In every clime and nation.

The boy, whose hope in its farthest scope

Was placed on his Christmas dollar,

Now rhymed of doves, and sighed for loves,

And sported a Byron collar;

And girls—"Ah, the girls!" the good Saint groaned—

'Twas so altogether shocking:

They dreamed of clothes and mustached beaux,

Instead of a Christmas stocking!

"All Cupid's work!" growled the irate Saint—

"The graceless, gay young sinner:

I'll lay my rod on that impish god

Ere I eat my Christmas dinner.

To beard me thus in my own domain:

The rogue is past redemption.

I'll break his darts, I'll mend his hearts,

Or I'll—"What, we need not mention.

So Santa Claus donned the bear-skin coat

Bequeathed him by Ursa Major,

Took something strong, for the way was long

(Our Saint is a keen old stager).

His reindeer team shook their silver bells,

And sniffed the north wind gladly;

"Now," Santa Claus cried, "hurrah for a ride!

These earth folks need me sadly."

They skimmed the frozen polar sea, like dart from cross-bow springing;
 O'er snow-clad plains they swiftly sped, like swallows southward winging;
 Through forests dim, where ice-clad trees in ghostly garb were bending;
 Through wizard realms, where night and day in light and shade were blending.

Like flitting dream sped the reindeer team,

The Saint cheering "Onward!" loudly,

Till hoofs struck fire from tower and spire

Where Cupid's flag floated proudly.

Like summer rose glowed the saintly nose—

The punch had been somewhat heady—

His brow knit with ire, his eye flashed fire,

He grasped his rod and made ready;

Then, hiding his sleigh behind a cloud,
And gathering his furs about him,
With stately port into Love's own court
The Saint advanced to rout him.

The traitor's court was a crystal hall,
Bedecked with wreaths and flowers;
For Love had breathed o'er the sleeping earth
And wakened the spring-time flowers.
The holly twined round the gleaming dome,
And hung o'er each lofty portal,
While ivy leaves wreathed each taper bright,
Like Love in its youth immortal.
The youth and the maids of every age
The traitorous god surrounding,
Were hailing with joy the saucy boy—
The tableau was quite confounding.
Our good Saint muttered, in heart-felt wrath,
An unsaintly exclamation;
For Cupid, perched in a swinging wreath,
Was lord of the situation.

"Why, who comes here?" quoth the laughing god.
"Tis I," growled the Saint, with passion:
"Tis Santa Claus, Christmas' long crowned king,
Though now, it seems, out of fashion.
Begone, young Sir: we've had quite enough
Of your mad-cap court and revel;
Now Santa Claus reigns in his own domains,
And you may fly to the ——!"
Our Saint here raised his threatening rod;
The lad only laughed still bolder;
Then, leaping light from his garland bright,
Came plump on the Saint's broad shoulder.
"Most potent, grave, and reverend Sir
(I quote you a well-known poet),
Though I'm sometimes bought, I am never caught—
When I am, just let me know it.
You brought this rod to banish a god,"
He cried, as he snatched it gayly;
"And faith it stings; but I'm blessed with wings
That save me from trouble daily.
Good father, your switch shall famous be:
By way of retaliation,
Old Santa Claus' rod I now declare
My wand of administration.
Each thorn to a verdant leaf shall grow,
Undying as Love's own bowers;
Each snow-flake to berry waxen white
As Hymen's festal flowers.
The mistletoe bough, by Cupid's vow,
Is spell-bound now and forever,

"THEY KISSED HIM ON LIPS, ON CHEEK, ON CHIN."

And winter with icy touch shall ne'er
 The bloom from the branches sever;
 And under its shade each youth and maid
 Shall forfeit to Cupid's treasure
 The tax that he sips from rosy lips,
 And claims at his royal pleasure."
 So saying, he waved the mystic bough
 Quite solemnly three times round him.
 What words can paint the wrath of our Saint!
 He found that the spell had bound him.
 "Your forfeit, Sir," cried the roguish god:
 "I gave you an honest warning.
 You'll find the kiss from each bright-eyed miss
 Most certainly not alarming."
 In vain old Santa Claus stormed and swore:
 What should have been maledictions
 Were lost 'mid the curls of threescore girls
 And changed into benedictions.
 They kissed him on lips, on cheek, on chin;
 His saintly old beard was bristling:
 They kissed, though he scowled—they kissed, he growled.
 Young Cupid in glee was whistling.
 "Grace, grace!" at length roared the poor old Saint,
 In utter desperation;
 "Confound that bough! it would peril, I trow,
 St. Anthony's reputation."

"My arctic friend," cried the roguish boy,
 "I'm not so easily banished."
 Then, flinging his rod at the laughing god,
 Our Saint up the chimney vanished.

MORAL.

A moral is always—at least, they tell me—
 The key of the archway, the pith of the tree,
 The dark, rugged root whence the bright blossoms grow,
 The strong, bitter suds whence the soap-bubbles blow;
 But not being much of a moralist's mind,
 It takes some hard thinking a moral to find.
 Our Saint's sad experience just leads me to say,
 Young Love is a despot; so don't say him nay.
 Our wills are his plaything, our hearts are his throne:
 Since the rascal must rule us, why—let him alone.

HOLLAND AND THE HOLLANDERS.

WATER BOAT.

HOLLAND is a geographical paradox. Its history is a subversion of the laws of nature; and all its successes have been won by a perpetual struggle with the elements. The ocean said to the Hollanders, "You shall have no country here." The Hollanders said to the ocean, "We will have a country here;" and they had one in spite of water, winds, and waves. Holland, more than any region under the sun, illustrates

the power of industry and perseverance. It shows, from the first to the last, that to the active hand and steady will nothing is impossible.

Such a land as Holland exists nowhere else. It is not merely the most singular of kingdoms—it is the only one of its kind. You may travel the world over, and yet be unable to form any conception of the Netherlands. You may live there your life long, and have no adequate idea of the remainder of the globe. Nature is responsible for the planet, but man created Holland; and the Hollander might almost be excused for substituting anthropology for theology in his creed.

Nearly the whole region is below the level of the sea, which is striving constantly but fruitlessly to recover its ravished domain. The keels of its ships are above the chimneys of its buildings, and the frogs that croak in the bulrushes of its ditches look down upon the swallows twittering on its house-tops. The entire country swarms with incongruities. Canals are employed in the place of roads; windmills are used instead of steam-engines; and people live as much on the water as on land. What is commonly known as scenery hardly exists in Holland; and yet the kingdom is picturesque from its peculiarity, having furnished to Paul Potter, Ruysdael, Vanderheyden, Backhuysen, and other of its painters subjects without end. Holland, indeed, compared to other countries, is like a cabinet-picture by one of its native artists. It is wonderfully exact, highly finished, thoroughly worked up—nothing left to be done that labor can supply. Go where you will, the canals and barges, windmills and quaint gable-ended houses, the tree-planted quays,

TASTING SCHNAPPS.

and comfortable but stolid-looking people, follow you remorselessly. Be you in Delft, Leyden, Enkhuysen, or Nimeguen, it is much the same. Looking out of your window, or walking in the street, or floating on the water, you find it difficult to determine in which of the twelve provinces you are. Still, as you tarry in the Netherlands, and become acquainted with its phenomenal character, you find variety in its monotony and novelty in its regularity.

The best way to enter Holland is by Rotterdam, between which city and London steamers ply regularly. It is not easy to conceive a more marked difference than exists between the British metropolis and the Dutch sea-port. Situated on the Meuse, or Maas—there an estuary through which a large part of the combined waters of the Rhine and Meuse find their outlet—you are gradually prepared for the coming change by your journey up the river. You pass on the right the little fortified sea-port of Brielle, on the island of Voorne, the birth-place of Admirals Van Tromp and De Witt, and remarkable in history as the first place taken from the Spaniards by William de la Marek, in 1572, and worthy to be considered the nucleus of the Dutch Republic. Eight miles further on is Vlaardingeng, the head-quarters of the herring fishery. About the middle of June the officers of the herring fleet repair to the town-hall, take an oath to obey the laws of the fishery, pray in the church for a prosperous season, and, with flags flying, set

sail, amidst the general rejoicing of the towns-people, who observe the occasion as a holiday. The fishery usually lasts about five months. The first fish caught are sent in swift-sailing yachts to Holland, where their arrival is awaited with such anxious expectation that a watchman is placed in the tallest spire to announce their earliest approach. The first kegs of herring caught are sent to the king and his ministers, who pay a handsome premium for them.

In the vicinity of Rotterdam, though not directly on the river, is Schiedam, famous for its gin distilleries, some two hundred in number. Until I visited one of the largest distilleries it never occurred to me—so ignorant was I of spirituous etymology—that the word gin is a contraction and corruption from *geneva*, or *genèvre*, meaning juniper-berrie. I have no means of knowing the exact amount of schnapps, as the natives call it, manufactured in the little town. I was told, however, that it reaches nearly ten millions of gallons annually, and that fifty millions of guilders will scarcely represent the capital employed. The gin, the purest and by far the best in the world, is made from rye and barley, a few juniper-berries, and sometimes hops, being added in the rectification to impart to the spirit its peculiar terebinthine flavor. The process of manufacture is not materially different from that of other distilleries. As a stranger and an American, I was, of course, asked to taste the schnapps. It was very good for gin, which,

however grateful to the English or Dutch palate, is not pleasant to mine. My only object in tasting the spirit was to form some notion of the flavor of the pure article, which is not likely to be had out of Holland. I seriously question if any body who has not been there has had an experience similar to mine. Over forty thousand swine are fed upon the refuse grain of the distilleries after the spirit has been extracted, and become very fat, as they do in this country, upon such nutriment.

Schiedam is a flourishing town of seventeen or eighteen thousand souls, with little to be seen, and less opportunity to see it, as it is always enveloped in smoke, pouring out in great black volumes from its hundreds of chimneys.

Rotterdam now comes suddenly into sight, and very soon you land at the fine quay, called the Boompjes, extending along the river for nearly a mile and a half. The quay is planted with elms, from which it takes its name (boompjes means little elms, though they have now grown to large size). It will probably recall Cheyne Walk, at Chelsea, which is, however, on a smaller scale. The principal hotels and some of the best houses are on the Boompjes, a favorite promenade with the inhabitants. The city has grown rapidly of late, having a population at present of about one hundred and twenty thousand, and is in size and importance the second town in the kingdom. In the form of a triangle, one side running parallel with the Maas, it consists of as many canals as streets, the three principal havens (harbors) opening into the river, of which they are merely branches or creeks. They communicate with each other, and with the various intersecting canals, affording not only a constant supply of water, but preventing stagnation by the ebb and flow of the tide. Communication between different parts of the city is maintained by draw-bridges, but across some of the widest havens ferry-boats ply. The canals, deep enough to admit large vessels to the very doors of the warehouses, serve the purpose of docks, and greatly facilitate the receiving and discharging of cargoes.

If a stranger to Holland, Rotterdam will interest and entertain you vastly. You will be struck by the odd combination of canals, bridges, trees, and shipping in the heart of the town; with the tall, quaint buildings, whose gables face the street and overhang the foundation; by the numerous sledges—used instead of wagons—which are often facilitated in their motion by jets of water from barrels carried in front. Why these sledges are employed, when wheeled vehicles would be so much better, is something an American can hardly comprehend. The reason is their cheapness—a very serious consideration there. A sledge can be made by any body who has the wood and a few nails,

while a wagon could not be bought for less than a hundred guilders, which to many a Dutch laborer is a sum he never dreams of possessing. The horses and the common people are shod so clumsily—the latter with wood—and make such a clumping and clattering noise over the pavements, that, with the grating sound of the sledges, the nerves of a sensitive person are apt to be disturbed. The natives are too phlegmatic to notice such trifles. You might walk up behind them and fire a pistol within an inch of their ear without discomposing their oleaginous equanimity, or causing them to look round to see what had happened.

A great dike, or dam, erected at the junction of the Rotte (a small stream) with the Maas, passes through the centre of the town, and gives it the name Rotterdam. Upon this dike stands Hoeg Straat, or High Street, and on the ground between it and the Boompjes—which has been gained from the river since the erection of the dam—the modern part of the city has been built.

On a wide bridge over a canal, answering for a market-place, is a bronze statue of Gerrit Gerritz, better known as Desiderius Erasmus—the name into which he translated, according to the then custom of the learned, his homely original title. The natural son of Gerard Praët, though living in stormy times, was a lover of peace and quiet—preferred a good dinner to wrangling, and a Greek thesis to objurgation. With all his rationalistic tendencies, he was superstitious and timid to the last degree, proving that timidity may co-exist with independence and nobleness of heart. The dwelling in which the eminent scholar first saw the light, more than four centuries ago, still stands in the Breede Kerk Straat, bearing a Latin inscription: "*Hæc est parva domus magnus quâ natus Erasmus*" (this is the small house in which the great Erasmus was born). The spirit of practicality enters every where in this busy century, and the home of the reformer is now a gin-shop.

The Church of St. Laurence contains the monuments of Admirals Van Brakel, Cortenaer, and De Witt, erected to their memory by the States-General, and an excellent organ, quite equal, in my opinion, to the more famous organ at Haarlem. The architecture of the church, though much neglected, is curious and interesting.

You should not quit Rotterdam without visiting the Exchange. The best hour to go is three o'clock, when the hall is crowded with merchants and speculators of numerous nationalities. You will see there Germans, Flemings, French, Italians, Spaniards, Armenians, Greeks, Poles, Russians, English, and Americans; and as all of them speak at times in their native tongue, and get greatly excited over advancing or declining prices, the scene is one of polyglot confusion. All

those varieties of people have business interests there, so that Rotterdam, intensely Dutch as it is, is also extremely cosmopolitan. I had always found the Hollanders so staid and taciturn that when I first stepped into the Exchange—there was what we should call a corner in grain at the time—I imagined the members had been endeavoring to put up the price of gin by consuming it in large quantities. The most conservative citizens, who, under ordinary circumstances, looked as unemotional as a clam, were heated and florid, swinging their arms about like windmills, and screaming at the top of their voices. These Dutch solos, duets, trios, and quartettes, with a many-tongued chorus of all the other European countries, impressed me like the roaring absurdities of the opera bouffe. It was hard to distinguish sounds in such a hubbub, but I am confident I heard the ordinary commercial phrases in at least twelve languages. The greed of money appears to inspire every body with a passionate intensity. The Rotterdam Exchange can be as noisy and turbulent as the Paris Bourse or the New York Gold Room.

A foreigner will not fail to notice the little mirrors at each side of the windows of nearly all the better class of dwellings. These are placed at an angle of forty-five degrees to each other, and reflect in opposite directions, thus enabling the inmates to see whoever and whatever is passing in the street without themselves being visible. It might be supposed from this that the Dutch are unusually curious; but the arrangement of the mirrors is, I infer, quite as much to save time as to facilitate observation. The Holland maiden or housewife can sit in her chamber with her knitting or sewing—to be idle in Holland is deemed the blackest of sins—without losing precious moments in looking out of the window. All the towns of any size have these reflecting conveniences, and I have often wondered that they have not been introduced into this country.

Water-drinkers will find in Rotterdam, as in all the lower part of Holland, that nature's beverage is neither good nor abundant. The water of the Maas, commonly drank there, is far from pure or sweet, and is very likely to disagree with those unaccustomed to it. Water of a drinkable sort is so scarce as to be an article of traffic in Holland. Great pains is taken to catch all the rain which falls, and the contrivances to this end are many and ingenious. Most of the dwellings are provided with tanks, and the water collected is used for all culinary purposes. The quantity is not sufficient, however; and in the large cities, like Amsterdam, water is brought in stone bottles from Utrecht, which is comparatively high, and where there are flowing streams. But the main supply of the metropolis and of adjoining towns is

from the river Vecht, above Weesp. It is carried twelve miles in large barges, and the poor who have no cisterns buy it at so much a gallon; the price, as may be supposed, being very low, but enough to pay a fair profit on the transportation.

I have often noticed in Amsterdam how these barges rose out of the canal as the water was pumped from them and distributed to customers. When they first reached their landing they would be on a level with the quay, and after they had discharged their cargo they would be eight or ten feet above it. The rates of water vary with the season and with the weather. What we should call a drought is hardly known in such a moist climate, but there are frequently periods of absence of rain. Then, and in winter, when every thing is frozen up, quotations advance. It frequently happens that a passage has to be cut through the ice of the canals, at a heavy expense, to allow the water barges to pass.

Dort, or Dordrecht, ten miles southeast of Rotterdam, is interesting as the place where the first Assembly of the States of Holland was held after their revolt from the yoke of Spain, in 1572. It was there also that the famous Synod of Dort sat for six months, discussing air-drawn absurdities touching Divine election, original sin, and fore-ordination, to which the musty members attached so much consequence that their president declared at the end of the session that its miraculous labors had made hell tremble. Whether they did or not has never been satisfactorily ascertained, though they were tedious and dreary enough to have affected even that unimpressible region.

Dort, with about twenty-five thousand people, and one of the oldest towns in Holland, is a haven for the gigantic floats of wood, from the remote districts of the Black Forest and Switzerland, which, brought down the Rhine by crews of four or five hundred men each, are there broken up and sold—a single raft sometimes yielding as much as \$150,000. The city is on an island formed by a terrible inundation in 1421, when the tide in the estuary of the river, excited by a violent tempest, burst through the dike, swallowed up seventy-two villages, and destroyed more than one hundred thousand lives. Thirty-five of the villages were irretrievably lost, and no vestige even of the ruins has been discovered down to this day.

Not many years ago most of the traveling in Holland was done by the canals on *trekschuiten* (drag-boats), which conveyed passengers and goods to every part of the kingdom. These boats are still largely used in carrying freight, and passengers who have not the means to travel on the railway, by which all the important points of the country are now connected. The *trekschuit* has a fore-cabin (*ruim*) appropriated to servants

MILL ON THE MAAS, DELFTHAVEN.

and peasants, and an after-cabin (roef) set apart for the better classes, who, by-the-bye, even before the railways were built, very seldom patronized this kind of vessel. It is a very slow and tedious mode of journeying, but yet so well adapted, as it would seem, to the Dutch nature, that I have often wondered it felt the need of any other. No one can be said to have seen Holland properly who has not been somewhere on a *trekschuit*. I have made a number of short journeys on those singular barges, and would have gone all over the kingdom on them, could I have been assured that I had five hundred years of life to spare. The *trekschuit* is usually drawn by only one horse, and the distance made averages about four miles an hour. This is very exciting, of course, especially to a man addicted to express trains; but it is questionable if the nervous tension and cerebral agitation caused by such extraordinary speed be not a reckless waste of the vital forces.

I have seen lame geese pass a *trekschuit* at its greatest celerity as a hare passes a hedgehog; and several times, when I got off the boat to walk a little, I fancied it was moving rapidly in the opposite direction. I have stated that the average movement of the national barge is four miles an hour. I have said this on information; but I think it must be a mistake arising from my imperfect acquaintance with the language. The statement must have been a mile in four hours;

and, now that I reflect, I am convinced that the two phrases in classic Dutch are exactly synonymous.

This species of travel rarely ends in bankruptcy to the traveler, as the general fare is hardly a stiver (two cents) a mile. If time, however, be money, as we Columbians believe, no Amsterdam banker can, with all his wealth, afford the luxury of a snail-rivaling *trekschuit*. The lad (*hetjagertie*) who rides the towing horse enjoys himself exceedingly on these lightning-like expeditions. He receives at each stage a few cents (a Dutch cent is less than two-fifths of the American cent), and at the end of the journey is blessed with a stiver, which so elates the youth that he immediately rushes into prodigality. A rumor was current in Breda when I was last there that one of the horse-riding lads had stirred his companions to their depths by amassing a fortune of forty stivers. The story was so marvelous that I inquired into it, and discovered that it had been grossly exaggerated. The boy had been working steadily for several months, and had accumulated in that time the sum of four stivers. He had nothing in the world besides, and this nothing had been added by rumor to the original figure in the form of a zero, swelling the amount beyond all ordinary bounds, and accidentally but shamefully abusing the public-credulity.

If any of your ancestors, beloved reader, came over in the *Mayflower*, or had any thing

DELFTHAVEN.

to do with the ill-fated *Speedwell*—and they must have done both if you have a drop of New England blood in your veins—you will go to Delft, and imagine the precise spot where Robert Cushman, John Carver, William Brewster, and their associates embarked from the haven in their little vessel on the memorable July 22, 1620. You remember what ill fortune they had: if you don't, you had better read up on the subject, in order to do full honor to the memory of the Pilgrim Fathers, about whom we have concerned ourselves much more than they ever concerned themselves about us.

While you are gazing in puritanic admiration and enthusiasm at the identical spot where they went aboard, we, who are not pilgrim-descended, will walk around the old town.

Delft is as dull and drowsy as any place of twenty thousand inhabitants comfortably can be. Once known for its pottery—Delftware—it has even lost distinction in that branch of manufacture. Hardly any one is to be met in the streets, and you marvel where people enough can be found to occupy the spacious and often handsome houses you see around you. But Delft has two or three objects of interest, the first of which is the New Church, containing the costly but tawdry monument erected by the United Provinces to William I., Prince of Orange. His figure in marble reclines upon the tomb, and at his feet is a carving of the little dog

that saved his life from the Spanish assassins near Mechlin by jumping on the bed, arousing his master, and giving him time to escape. When William was finally murdered (after eight fruitless attempts) by the Burgundian fanatic, Balthazar Gérard, the faithful beast refused food, pined, and died; and the inscription mentions the dumb creature's devoted attachment. The second and better statue of the prince is in a sitting posture under the arch at the head of the tomb. The house in which he was assassinated, not far from the church, is called the *Prinssenhof*, and is now used as a barrack. After crossing the court a small door leads to the staircase which William the Silent was about to ascend after dinner, and to the passage where Balthazar stood, so near his victim that the fatal pistol must almost have touched his body. (In the museum at the Hague the dress worn by the prince at the time of the assassination is still preserved; it is a plain gray leathern doublet, sprinkled with blood, pierced by balls, and slightly burned by the powder.) An inscription on a stone in the wall of the building records the tragic event, and three holes—they are of very questionable authenticity—in another stone near by are pointed out as having been made by the bullets. The noble patriot expired in the arms of his sister and his wife, the latter the daughter of Coligny, who had been similarly murdered before her very eyes in the terrible massacre of St. Bartholomew. The

last words of the hero were, "My God, my God, have pity on me and this poor people!" (*Mon Dieu, mon Dieu, ayez pitié de moi et ce pauvre peuple!*)

Hugo Grotius (*De Groot*), the celebrated jurist and writer, is also buried in the New Church—he was a native of Delft—and a simple monument marks the spot. While there the story of his imprisonment and romantic escape came vividly to mind. For the defense of religious toleration he was imprisoned in the castle of Loevenstein, and so closely guarded that even his father was denied the privilege of seeing him. His devoted wife, by persevering petitions, at last obtained permission to share his captivity, and with her society and that of books the rigors of confinement were greatly mitigated. His favorite study was theology, and to aid him in it he borrowed many different volumes. After he had been in prison nearly two years his wife discovered that he was less strictly watched than at first, and that the chest containing his linen and the books he returned was often allowed to go out without examination. She perceived in this the means of escape, and, boring some holes in the chest for the admission of air, prevailed upon her husband to get into it; having previously confided the secret to her maid, and having induced her to accompany the concealed theologian. The chest, which, as usual, was sent by boat from the prison to Gorkum, was, when taken out by the guards, complained of as unusually heavy. The maid said it was the Arminian books, and one of the soldiers jestingly remarked, "Perhaps it is the Arminian himself." Without more words the precious freight was placed upon the vessel, and, once afloat, the attendant made the signal with a handkerchief, as agreed upon, to her mistress, anxiously watching from a window of the castle. The chest safely reached its destination, and was deposited in the house of Jacob Daatzelaar, one of Grotius's most intimate friends. The author was soon released, and disguised as a mason, with a rule and trowel in his hand, he made his way to Waalwyk in North Brabant, where he was free once more. His wife was rigorously confined for a while, but was soon liberated on petition made to the States-General, and rejoined her husband in Paris.

In the Old Church of Delft, notable for its leaning tower, is the monument of Admiral Van Tromp, who took part in thirty-two naval engagements, overcame in 1652 the British fleet under Blake in the Downs, and afterward defied the English by sailing up and down the Channel with a broom at his masthead. The veteran hero fell at last on his own deck in a battle with the English near the mouth of the Maas. In the same church are buried Admiral Piet Hein (who captured the Spanish silver fleet) and Leuvenhoek,

WILLIAM OF ORANGE.

the naturalist, both of them natives of the ancient town.

The distance from Delft to the Hague, barely five miles, may be made on a *trekschuit* to advantage. The country thereabout is even more thickly covered with cottages, country-seats, and gardens than the region on the other side of Delft, and has the same prosperous and monotonous display of rural life.

There is nothing a Dutchman who has achieved any thing like independence sets more value on than a country-seat. He always has connected with it a garden laid out with much more care than taste—which is not, by any means, as the tourist very soon perceives, one of the national defects. The country-seat, called a *zomerhuis* (summer-house), or *tuinhuis* (garden-house), is ordinarily a wooden box brightly painted, and situated at the end of a narrow strip of ground, inclosed on three sides by slimy ditches bordered by hedges, and on the fourth side overlooking a canal. The strip of land is laid out in flower beds, the flowers of one kind and color being confined to particular beds, with the method and regularity characterizing every thing in Holland. There are meandering walks, with shrubbery cut in fantastic patterns, and at the extremity of the inclosure is an iron gateway, over which is inscribed in gilt letters the sentimental or pastoral title of the rustic retreat. I remember some of these, as,

for instance, *Myn Lust en Leven* (my pleasure and life), *Gerustelyk en Wel te Vredn* (be tranquil and content), *Vriendschap en Gezelschap* (friendship and sociability), *Lust en Rust* (pleasure and ease), *Wel te Vredn* (well contented), *Myn Genegentheid is Vol-dann* (my desire is to satisfy), *Niet zoo Kwaalyk* (not so bad), and many others of a similarly quaint sort.

Some opening is always left in the garden, either opposite the gate or through the hedge, that the passer-by may feast his eyes on the parterres, pyramids of flower-pots, primly and stiffly cut trees, and every right-angled, circular, or conical-shaped object in the mathematically exact and superlatively monotonous garden.

The Dutchman seldom owns an acre of land without having a fish-pond. He so delights in still and semi-stagnant water that, not content to be surrounded on every side by canals, ditches, and sluices, he must have an additional pool as impure as odorous under his very nose. In the neighborhood of all the large towns the tradesmen and merchants, having their shops and counting-houses in narrow streets, own a little garden in the outskirts, where, if they have no house, they can at least retire after business and spend a few hours with their families. In town they are to a certain extent shut away from the direct effluvium of the canals; but when they go into the suburbs they enjoy the full benefit of all the canals and ditches for miles around, and are happy in proportion to the number of distinct miasmata they are permitted to inhale.

There is no accounting for taste any where, and certainly there is no accounting for the sense of smell in Holland. During cool weather the country is very endurable; but when the mercury gets above seventy or eighty, the atmosphere is not as balmy as I should desire. Not to put too fine a point upon it, it is extremely obnoxious, and at times almost overpowering. How could it be otherwise, with the whole land intersected by standing water, covered half the year with a luxuriant crop of emerald duck-weed! Often wondering how Dutchmen could live during the summer, I have questioned them as to their nasal resisting power when the native stenches were unusually vigorous. To my amazement they always answered that they did not perceive the atmosphere was tainted in the least—which forced me to the conclusion that the Dutch nose was designed by nature for ornament instead of use.

I should like to know what possible advantage there can be in having a nose in Holland, unless it is capable of recognizing at least sixty separate smells every minute of the night, and fully twice as many every minute of the day. We seldom notice what we have long been accustomed to, and the

Hollander, born and reared amidst his superabundant sweets, never learns how delicious they are to the proboscis of a stranger. I have been told that nothing affects the average Dutchman but fresh air, that, when brought into a full current of it, he immediately faints away, and that the application of a decayed herring to his nostrils is necessary to his restoration.

I don't vouch for the truth of the story: indeed, I think it doubtful; for no such experiment could possibly be made in any part of Holland.

On spring and summer afternoons the Hollander repairs with the members of his family to his garden-house; reads his paper over his pipe, his tea, coffee, beer, or gin; discusses trade, or indulges in gossip with the friend or friends he has invited there; while his wife chats and sews, and his daughters amuse themselves with watching the pleasure-boats that glide over the canals with their freight of merry-makers. The climate is so moist that soon after sundown it is neither pleasant nor wholesome to remain out-of-doors. The garden is then abandoned to the croaking frogs, and the smoking, talking, and drinking are continued under the roof.

Malt and spirituous liquors are freely used in Holland, but generally with moderation, even by the peasantry, who are very seldom seen intoxicated. It is an article of belief in the amphibious kingdom that water, taken internally, is not healthful, and the kind of water one gets there certainly is not. Hence very little of it is used, except for washing and navigation. A very common substitute is Seltzer and other mineral waters, mixed with Bordeaux or other light wines, or flavored with the strong, rich cordials so abundant throughout the country. Holland is so moist, and the air is so dense, that men can drink a great deal of liquor without being injured or even affected by it. I have seen staid and venerable merchants swallow gin or brandy enough at a single draught to make an American decidedly tipsy, though it had no more effect on them, with their well-protected nerves and phlegmatic robustness, than so much tea or milk.

The Dutchman is unquestionably peculiar. He isn't like any body else, and not very much like himself, if we take his variations and incongruities into account. With strong will, sterling character, and undaunted courage—with intense patriotism, quick sympathies, and generous impulses—he seems in his every-day life to be selfish, indifferent, and stolid. This is because, under ordinary circumstances, he is in no wise demonstrative, and not a whit romantic or sentimental. He is very conservative, is attached to peace, and cleaves to established order; but when his rights are in any way invaded, or his

love of country appealed to, he forgets his interests and himself, and is prepared to make any sacrifice.

What he does he does thoroughly, and, above every thing else, he is methodical and systematic. He is trained from his earliest years to some kind of calling or occupation. The formation and history of the land, as well as his daily experience, show him in the clearest light the benefit of money-getting and the value of independence. By a series of transmissions and long-continued temperamental inheritance he is industrious, persevering, and thrifty. These qualities grow and strengthen with his age, until he appears the impersonation of routine and business. Domesticity is an essential element in his character. Hardly any Hollander remains a bachelor, unless by accident or necessity; and as soon as he arrives at maturity he seeks a wife, and is anxious to be surrounded by a family. In the new relation he has an additional stimulus to the acquisition of wealth; and so he divides his time between his home and his shop, office, or counting-house. His tastes are simple and his wants are few; but yet he takes substantial comfort, and enjoys himself much more in his quiet manner than men of a different nationality would under circumstances far more favorable.

By the mere surface-seer the Hollander is apt to be misjudged. His rotund, unctuous form, his full, round face, his small, rather sleepy-looking eyes, and his imperturbable manner, make him appear stupid to a person more vivacious and nervous in organization. Hans or Dietrich to an Italian, Frenchman, or American, seems a species of money-making oyster, satisfied in the water and contented on land, who feeds well, drinks often, thinks never, and is ready always to turn a stiver into a guilder. He has none of the passionate unrest or evanescent enthusiasm, none of the unsettled longings or haunting fancies, which are so much a part of the more southern nations. He does not wear his heart upon his sleeve, nor does his tongue babble to the wind. He is not graceful, nor magnetic, nor picturesque; but with a wise economy of his mental and moral forces he adapts means to ends, and by a careful study and use of little things builds for himself a firmness of purpose and a strength of character which time can not change and adversity will not shake.

The Hague—called by the natives S' Gravenhage, meaning the Count's Hedge, or Grove—is only four miles from the North Sea. It has risen to importance within the last seventy years, mainly from the fact that it is the residence of the court and foreign ministers, and the seat of the government and the States-General. Louis Bonaparte conferred upon it the privileges of a city, and it ranks as the political capital of the

A ZEELAND PEASANT WOMAN.

kingdom. The Hague is one of the best built and least Dutch towns in Holland. Paris has sensibly influenced it, as can be seen by the manners and customs, the arrangements of the shops, and the style of living among the upper classes. French is extensively spoken, as you will observe if you frequent the pleasant promenade of the Voorhout, the Vyverberg (a well-shaded square), or the animated quarters known as Prinssengracht, Kneuterdyk, and Noordeende. Many of the streets are broad, brick-paved, and bordered with trees. The city has grown and is growing rapidly. Forty years ago it had not more than fifty thousand, and can now boast of nearly one hundred thousand inhabitants.

The principal lion is the collection of paintings in the National Museum, the former palace of Prince Maurice. The pictures, almost entirely Dutch, have a combined excellence which can be found nowhere else. The most remarkable painting is Paul Potter's masterpiece, "The Young Bull," which, with the cow lying on the grass in the foreground, the sheep standing near, and the farmer looking over the fence—the figures are all life-size—is as perfect an imitation of nature as I have ever seen on canvas. Rembrandt's "Anatomical Lesson," representing a corpse on a dissecting-table, a surgeon, and a number of medical students standing about it, is a very vivid and striking, though ghastly and unpleasant picture. The dead body,

NORTH BRABANT WOMAN.

which is a little foreshortened, is finely drawn, and the cadaverous hue exactly imitated. It has been cut only at the wrist, and the professor is supposed to be explaining the laws of anatomy before the dissection begins. The figures are all portraits, and the counterfeit presentment of death is so accurate a study that physicians have asserted it is evident the corpse is that of a person who has died of inflammation of the lungs.

Both of these paintings are, of course, very valuable. When Napoleon carried the "Young Bull" to the Louvre, the Dutch government, it is stated, offered him \$100,000 if he would allow it to remain at the Hague. The King of Holland paid \$15,000 for the "Anatomical Lesson" many years ago, and five times that sum has been offered since and refused. At present, like most great pictures in Europe, money could not purchase it.

Rubens's portraits of his two wives, Elizabeth Brants and Helena Forman; Vandyck's portrait of Simon, an Antwerp painter; Gerard Dou's "Woman and Child," illustrating his admirable arrangement of different lights; Poussin's "Venus Asleep," with some of Wouverman's landscapes, Snyders's hunting pieces, and Teniers's *genre* pictures, are among the very best specimens of their particular kind of art.

On one side of the Vyverberg (this means Hill of the Pond, and shows how very slight an elevation is regarded as a hill in Holland)

stands the Binnenhof, so called because it formed the inner court of the count's palace, which is the only remaining fragment of the original building. The Gothic hall in the centre, somewhat resembling in style Westminster Hall, is the oldest architecture in the city, and possesses much historical interest. Upon a scaffold erected opposite the door the venerable patriot Jan van Olden Barneveldt was beheaded in 1619, on account of the false accusations of Prince Maurice, who is said to have stationed himself at the window of an octagon tower overlooking the spot to feast his eyes upon the execution of the man he had so cruelly persecuted and so bitterly detested.

Barneveldt's crime, it will be remembered, was his success in securing an honorable peace with Spain, which the prince violently opposed, knowing that his own talents fitted him solely for the field. Determined on revenge, he basely charged the Grand Pensionary with plotting to deliver his country into the hands of the Spaniards, and on this calumny he was tried, and, without any valid evidence, put to death.

He died as he had lived—grandly and bravely. Before he laid his head upon the block, he turned to the people and said, "Remember that I am no traitor;" and then repeating, as if to himself, the words of his religious teacher, Arminius, "A good conscience is paradise," he resigned himself to the executioner. The people, many of whom had at first believed him guilty, were touched by the tragic spectacle, and looked on the aged hero with weeping eyes. When the axe fell, a great sob, as though the heart of the crowd were breaking, burst forth; and when the noble head was severed by the shining steel, the people ran and gathered the sand, wet with the martyr's blood, and preserved it in vials as something too sacred for mortal touch. How like the people in all ages was this! They demand the life of the hero to-day, and mourn the dead martyr to-morrow.

Between the Buitenhof (outer court) and the Vyverberg is the Gevangpoort (prison gate), memorable as the place where Cornelius De Witt was confined in 1672 on a malicious charge of conspiring to assassinate the Prince of Orange, afterward King of England. Jan De Witt, having become unpopular on account of his unconstitutional method of forming the alliance with Sweden and England—his haste in the matter seems to have been justified by the emergency—had resigned his office of Grand Pensionary, and gone to visit his brother at the Hague. While with him in the prison a popular tumult, which had been long brewing, broke out; the mob forced an entrance, and, incited to fury by the calumnies circulated against the De Witts, dragged them forth, and tore them literally limb from limb.

At the Hague the water is more stagnant

than in almost any other part of the country. Though the sea is so near, the canals and streams, instead of flowing to, flow from it. To remedy this there are two large windmills in the vicinity of Scheveningen, which raise water from the Dunes (sand hills extending along the coast from Dunkirk to the Helder), and convey it to the town, displacing the stagnant water in the canals and effecting a feeble current.

On the outskirts of the city is the House in the Wood, built by the grandmother of William III. of England, and now the residence of the Queen of Holland. The House is externally plain, but finely furnished and decorated with numerous paintings and works of art. The Wood (Bosch) is a beautiful park nearly two miles long, with pleasant walks and pretty lakes, and, what is very noticeable in Holland, abounds in forest trees that have been allowed to grow as nature intended. These trees are an ocular treat after the training, clipping, and methodical tormenting to which almost every hedge, grove, and bit of foliage is subjected by the Dutch. Nature has had so little to do with the making of their country that it is not strange they have little reverence for her. They can not be persuaded that she understands what is best; and so in whatever shape she reveals herself, they set to work to improve her, persuaded she needs to be confined and limited by mathematical curves and lines.

If Cytherea were to rise again from the foam of the sea, and were to select the Zuyder-Zee as the place of her birth (she wouldn't be very apt to do this if she is the woman I take her for), the Dutch, I fancy, would drag her ashore in a net, and failing to sell her for a colossal herring, they would shear off the golden glory of her hair, pad her waist, broaden her oval face in a cheese-press, deck her lovely limbs with galligaskins, and set her to scrubbing floors. After they had done this, and after she had served an apprenticeship for ten years as a kitchen quean, they might accept her as a type of utilitarian excellence, but they would never recognize her pretensions to be considered the goddess of beauty.

A number of tame storks are kept in a small house in the fish-market of the Hague, and strut about there with an apparent consciousness that they are honored and revered. What the ibis was to the ancient Egyptians, what bears are to the Bernese, and pigeons to the Venetians, the stork is to the Hollander. The arms of the Hague are represented by a stork, which, throughout the country, especially by the peasantry, is held in a sort of veneration. This bird (*ooyevaar*) is never disturbed or injured, and to kill one is reckoned little less than a crime. The storks are encouraged to abide in Holland; and as it is thought a good omen

VLAARDINGEN BEAUTY.

for them to select any dwelling for their habitation, great pains is taken to induce them to build their nests on the roofs of farm-houses, and on the edge of a gable or near the chimney of a dwelling in town. An old cart-wheel, cheese-box, or some other contrivance is often placed on the roof as a temptation to nest-building, and a farm-house is hardly considered complete that has not a stork or two in or about it.

The dwellings of the poor, scattered all over the kingdom, with their steep thatched roofs, low walls, patches of carefully tilled land girt by ditches, answering the place of walls or fences, with a troop of ruddy and robust children playing about the door, and the clatter of storks overhead, are prominent features in every Dutch landscape. The great army of storks migrate to the South about the middle of August, taking with them the young they have reared; return usually early in May, and always seek their old nests.

In 1536 a large part of the town of Delft was destroyed by fire. During its progress the storks were seen carrying their little ones from their nests through the flames; and when they could not save them, refusing to desert their young, they perished in the same fiery death.

Scheveningen, on the sea-shore, three miles from the Hague, has long been a fishing village, and is now a very fashionable bathing-place. The sand hills thrown up along the beach so hide the ocean that I had no idea of its proximity until I was at its very rim.

HAGUE FISHERMAN AND DOG-CART.

Like every fishing population, the Scheveningeners are original and peculiar, not only in their habits, but in their customs and costumes. The fish-women wear a short, highly colored petticoat, a gay waist cut low, with a white inner neckerchief, sleeves coming to the elbow, a large cape lined with red, a huge fantastic bonnet closely resembling a coal-scuttle, and carry their wares in a basket on their head.

The fishermen convey their fish to the Hague in carts drawn by dogs (the animals are large and strong); and when they have completed their sales, return home in the empty carts drawn by their canine steeds. It is amusing to see with what a grand air they go trundling along, as self-satisfied apparently as one of our Celtic aldermen parading at the public expense in an open carriage on some highly important occasion, which he assists to illumine with a very red face and very yellow gloves.

As all tourists in Holland are anxious to reach Amsterdam, justly regarding it as the most interesting and most representative city of the kingdom, you and I, reader, will, at least for the present, skip the quaint and curious towns of Leyden and Haarlem, and enter the Dutch metropolis, whose foundations are said to have been built on herring bones.

Amsterdam (once called Amsteldamme, meaning the dike, or dam, of the Amstel) is the constitutional capital of the country, the ceremony of coronation being performed

there. Situated at the confluence of the river Amstel with the Y, an arm of the Zuyder-Zee, it is shaped somewhat like a crescent or bow, the string representing the Y, and the curve the boundary on the land side. Though of much less commercial importance than it was two centuries ago, it is still a great centre of traffic and trade, and its population, which is constantly growing, is now over two hundred and seventy thousand. Amsterdam is built on piles driven into the sand, which lies about fifty feet below the morass the city stands on. It has often been styled the Venice of the North, and resembles it in point of situation; but in its history, traditions, and the character of its people it is extremely unlike the Cybele of the Sea. Venice, in her days of splendor, was as mysterious and romantic as Amsterdam has always been direct and practical.

The principal outlet of the Amstel, entering the city on the southeast, winds through and divides it into the old and new sides (Oude en Nieuwe Zijde), and falls into the Y by numerous courses. The ramparts have been demolished, and on the twenty-eight bastions are as many windmills—the outward symbol of every thing Dutch. The town is surrounded by a broad canal or fosse, and in the interior are four other large canals, running in curves, and parallel with the outer one, called Prinssen Gracht, Keizer's Gracht, Heeren Gracht, and the Cingel—the last being the innermost. These are

AMSTERDAM.—THE AMSTEL.

lined with spacious and handsome buildings, and three of them are at least two miles long. The small canals, intersecting the town in every direction, divide it into as many as a hundred islands, and are crossed by some three hundred bridges.

Toward the sea, on both sides of the Amstel, the streets are narrow and crooked; but, in the new part of the city, are broad and well paved. The houses are of brick, four, five, and six stories high, with their gables to the street, and generally entered by flights of steps in front. The principal shops are in Kalvers Straat, Warmois Straat, and the Nieuwendyk, and are remarkable for their large plate-glass windows, as well as the excellence, extent, and variety of their stocks. There are few things which may not be had in Amsterdam for money. Loans of millions, and diamonds worth a small fortune, may be obtained, with every gradation down to a pound of choice butter or a bottle of the best Curaçoa.

The buildings of the city, so tall and narrow, and with such fantastic gables, generally rounded at the top or running off to a point, and often terminating in a carved white marble slab, look queerly enough to a stranger during the first few days of his sojourn on the Amstel. He is impressed with their universal determination against making an angle of ninety degrees. If there be a straight structure in the whole town, I have never seen it. The houses have declared eternal hostility to the perpendicular.

They lean forward, and lean backward; they lean to the right, and lean to the left—conveying the impression to an unfamiliar eye that the only reason they do not tumble down is that they haven't made up their mind which way to fall.

I have observed nervous foreigners walking along the edges of the canals, and constantly looking up at the monotonous brick piles, as if expecting to see them momentarily topple over.

I remember an Englishman who was so occupied in the Heeren Gracht one morning with watching the stately buildings that he walked into the canal. A burly native in a small boat rowed to the spot where the noble Briton had disappeared, and tried to drag him out when he rose to the surface. His intentions were excellent; but he was so short and fleshy that when he caught hold of the Englishman he lost his equilibrium, went over the side, and fell upon the struggling fellow in the water, very much after the manner of an enormous meal-sack. John Bull sank as if he had swallowed twenty gallons of boiled lead, and, coming up again, his broad face was purple. He couldn't swim a stroke, and would have drowned inevitably if the Dutchman hadn't gotten back into his skiff, and, seizing a boat-hook, fastened it in the seat of the poor man's trousers, and rescued him in the shape of a dripping clothes-pin. As soon as Bull discharged some of the unsavory water he had absorbed, he began to denounce Holland and every

AMSTERDAM.—THE HEEREN GRACHT.

thing in it. He threatened to bring suit against his burly preserver for assault and battery; abused the city for having dangerous houses which no sane man would walk near; and finally anathematized his optics if he didn't write to the *Times*. That is the last resort of your true Briton; but as it had no influence on the sturdy waterman, who didn't understand a word of English, Queen Victoria's outraged subject went off as wrathful as he was wet.

The order of architecture in Amsterdam, for want of a better name, might be styled the inebriated and staggering order; for the buildings look as if they had been trying to drink out all the Schiedam distilleries, and were a good deal worse for their effort. Their example must be a bad one. How can plain Jan or humble Marten hope to keep sober with such architectural irregularities ever before their eyes? This leaning of the houses is caused by the sinking of the piles on which they are built. They get out of the perpendicular, but they very rarely fall, so that their perilous condition is more apparent than real.

The most conspicuous and the finest building in Amsterdam—indeed, in all Holland—is the Palace, formerly the Town-hall. It is of stone, in a parallelogrammatic form, two hundred and sixty feet long and two hundred broad, and rests on some fourteen thousand piles. It contains a spacious hall, nearly a hundred feet high, lined with white marble, and really quite handsome.

The Palace would not be remarkable any where else, but the Dutch regard it as an incomparable edifice—much as the ancient Greeks did the Temple of Ephesus or the Parthenon. A view from the tower is much more remunerative than a ramble through the interior of the building, as from that elevated position you get at a single glance a correct view of the wonderful city, with its wilderness of narrow streets, its countless canals bordered with trees, its crooked houses with projecting gables, its crowded shipping, and thronged and bustling quays. Your range of vision takes in miles of the surrounding country, the great ship-canal, fifty miles long, leading to the Helder, the many little towns in the neighborhood, and the broad expanse of the Zuyder-Zee.

The main entrance to the Palace—every thing is inverted in Holland—is in the rear. The treasures of the once celebrated Bank of Amsterdam, now no more (described by Adam Smith in his "Wealth of Nations"), which used to regulate the exchanges of Europe, were kept in the vaults of this building. Most of the best pictures have been removed to the Museum; but one of the most interesting portrays Van Speyk blowing up his ship to prevent its falling into the hands of the Belgians.

In February, 1831, during the war between them and the Dutch, a gun-boat of the latter, in sailing up the Scheldt from Fort Austruweel to the Citadel during a heavy gale, to use a nautical phrase, twice missed stays.

All the exertions of her officers and crew did not prevent her from getting aground under the very guns of the fort, and within a few yards of the docks. The helpless situation of the boat having been perceived from the shore, a body of Belgian volunteers boarded her to make her a prize, and ordered her commander, a young officer named Van Speyk, to surrender. Seeing that resistance against overwhelming numbers was useless, and having frequently expressed his determination never to yield his vessel, he rushed to the magazine, laid a lighted cigar upon an open barrel of gunpowder, fell upon his knees in prayer, and in less than a minute the terrible explosion took place, blowing all of the crew but three, and every one of the boarders, to atoms. Van Speyk, an orphan, had been educated at the public expense, and most nobly did he repay the debt due to his country. In turn it remembered him by rearing a monument to his memory beside that of De Ruyter, and decreeing that there should always be a vessel in the national navy bearing his honored name.

The Museum, in the Trippenhuis, has among the notable paintings Van der Helst's "City Guard of Amsterdam" celebrating at a banquet the treaty of Westphalia, which confirmed the independence of the Dutch. The figures, twenty-five in number, are all portraits; and though none of them are of distinguished persons, they are so correctly drawn, are so well colored, and have such a marked individuality and life-like expression, that the picture has been called a miracle of the Dutch school.

Rembrandt's "Nightwatch," as it is called, though it is now thought to represent a company of archers going out to shoot at the butts, and his "Five Masters of the Drapers' Company;" Gerard Dou's "Evening School," with its marvelous management of different lights; Teniers's "Temptation of St. Anthony;" Backhuysen's "Embarkation of the Pensionary De Witt," and other paintings by Potter, Vandervelde, and Jan Steen—are all well deserving of long and careful study.

The churches of the city, like those of the country at large, are plain on the outside and bare in the interior; but they are grotesquely built, with six, seven, and eight gables, and often so entirely surrounded by shops that it is very difficult for a stranger to find their entrance. I have wasted a number of hours going round and round the damms, or open spaces, of the metropolis in the vain search for church doors.

The Dutch, as a people (the national creed is Calvinism), are extremely orthodox, and very regular in their attendance upon religious service. If they were not guided by unusual theological zeal, I question if they would not often fail to discover how to get into what they consider their temples of Divine worship. In respect to church-going,

STREET SCENE IN AMSTERDAM.

and the rigid observance of forms, the Dutch are the Scotch of the Continent. They recognize the Deity in every thing, especially in the thing that happens to fall out as they desire, and all matters of moment they associate with special providences. They are most vehement Protestants—their Protestantism often being a sectarian form of anti-Catholicism, as is natural after their long and bitter contests with the Spaniards, and their heroic defense of their political and religious rights. Service is held in the churches three or four times of a Sunday, and they who fail to attend at least twice are presumed to be dallying with Satan, and circumvented by his iniquitous snares. Sermons are announced in placards posted on the walls of the ecclesiastic edifices several days before they are preached, so that the public, as well as the congregations, may know what rare entertainment is in store for them. The clergymen still wear the puritanic costume of Charles I.'s time—a long black cloak, with a ruff about the neck—and generally confine their discourses to doctrinal points, spinning metaphysical webs, about total depravity, eternal reprobation, vicarious atonement, and the sin against the Holy Ghost, between the pulpit and their hearers, which the latter are constantly struggling to walk on.

The Old Church, styled St. Nicholas in the days of Romanism, has some beautifully stained windows, several tombs of Dutch admirals, a fine set of chimes, and a very sweet-toned organ.

AMSTERDAM.—THE PORT.

The New Church—termed new, I suppose, because it is only four hundred and sixty-three years of age—contains a number of historic monuments; among them one to Admiral De Ruyter, who sailed up the Medway and burned the English fleet at Chatham; another to Captain Bentinck, killed in the battle of Doggerbank; a third to the dramatic poet Vondel, called the Dutch Shakspeare; and a fourth to the heroic Van Speyk.

Though the greater part of the educated Dutch are Calvinists, and extremely earnest in their belief, they understand the wisdom and policy of the largest toleration. The Evangelical Lutherans, the Scotch Presbyterians, the Moravians, the English Episcopalians, the Baptists, Friends, Greeks, Jews, and Roman Catholics, have their places of worship. The Jews and Romanists are the most numerous: the former about twenty thousand, and the latter close upon fifty thousand.

Almost every body is disappointed in the activity and bustle of Amsterdam. Its quays are thronged, its streets are crowded, its shops are full, and its warehouses are always busy. It bears on every hand the marks of industry, perseverance, and prosperity. No man, woman, or child seems to be idle. Whatever it may be in theology, idleness is socially the unpardonable sin in Holland; and though the thing in which they are engaged may seem trifling to foreigners, it is followed, whatever its nature, with entire devotion. Neither loungers nor beggars are visible there; and yet to the Anglo-Saxon mind a vast deal of precious time is wasted for the want of mechanical contrivances, and of what New Englanders style faculty.

You see there, as in Rotterdam, any num-

ber of sledges for carrying purposes. One reason of this, in addition to economy, is that the conveyance of freight or goods of any kind by land is for a very short distance, nearly all the vessels being loaded and unloaded by and from the warehouses by means of blocks projecting over the borders of the canals. Very heavy burdens are frequently borne upon the sledges, without regard to the poor horses, which, though heavy and strong, after the national pattern, can not fail to be overtaxed.

The Exchange at half past three in the afternoon—the hour of high change—presents a supremely animated scene. Fewer nationalities are represented than at Rotterdam; but the transactions are very large and important, a single one sometimes embracing millions of guilders. The Dutchman has the profoundest sympathy with trade, which answers to a large part of his being directly and copiously. However calm and sluggish he may seem during much of the day, the hour of change rouses him, as a defiance of the Spaniards roused his ancestors. His nerves tingle then; his small eyes sparkle; his somewhat severe nature is simultaneously softened and hardened at the prospect of increasing his worldly goods, and of being enabled to expend still more upon his garden-house, which, if he were sentimental, he would term the home of his love, the Vacluse of his heart.

Until you get acquainted with Amsterdam you believe that paupers are not reckoned among its inhabitants. There are many of them, albeit they are not allowed to offend the public eye. I have heard it estimated that twenty thousand poor are fed and lodged at the expense of the city; and if this include the afflicted as well as the unfortunate, the

GATHERING THE FAMILY TOGETHER.

number can not be far from correct. The benevolent institutions of the city—as many as sixty—embrace asylums for the aged and infirm, the insane, widows, foundlings, and almost all persons suffering from ailments of mind, body, or circumstance.

There used to be, I have been informed, a hospital for fools; but there was so much contention as to who should occupy it—so many who ought to have been, and so few who were willing to go there—that the charitable enterprise was finally abandoned. Some waggish citizens urged the building up of the old walls of the town, and covering them with a great roof, as the most convenient and least discriminating asylum which could be erected. And this jest had much to do with the extinction of an institution which is so much needed that it can never be established any where.

A considerable portion of the poorer citizens live in the basements or cellars of the houses whose upper apartments are occupied by persons in comfortable circumstances. Such residences are damp and unwholesome, and yet their occupants seem generally to be active and robust. The Dutch, as a people, inherit excellent constitutions, which their very moist and trying climate—the thermometer varies from twenty degrees below zero to one hundred and five above—their impure air, and noisome exhalations from ditches and canals, are not sufficient to injure to any permanent degree.

A large part of the people, from motives

of economy, have, like the Chinese, their homes upon the water. They build, buy, or hire a boat slender enough to pass through all the canals, stock it with poultry, hogs, and cows, construct a cabin for their families, and so become independent of the outer world. It seems a little odd to have children and cattle, wives and pigs, infants and ducks, with barn-yards and household furniture, all under one roof; but the Dutch don't mind such things, and, on the whole, manage their domestic affairs very adroitly. They keep their live stock in one part of the boat, and their family stock in another. Those get fat, and these are content, and both contribute to the profit and comfort of the heads of the family. Among the peasantry and working people in Holland the women labor quite as much as, if not more than the men. In addition to rearing children, they perform such menial service as working in the field, driving carts, digging peat, and unloading vessels.

In this boat life the women do all the domestic offices, and garnish their cabins with tulips, hyacinths, and dahlias—for which the Dutch in all grades of society have an unconquerable passion—giving an appearance of refinement and comfort to what would otherwise seem a narrow, sordid, and dreary existence. All the members of the family, without regard to age or sex, take part in the management of their floating dwelling. When they are too poor to buy a horse, as frequently happens, not only the men but

the women and children drag the boat along from one village or town to another, or to different quarters of the city, as suits their convenience or their interests. These amphibious families generally support themselves by trading or exchanging of some sort. They carry vegetables, poultry, butter, eggs, and cheese to the cities, and, after selling them, make excursions to the country to purchase more.

A Dutchman with his variegated goods and chattels is an odd sight. I have noticed him and his wife, with four, six, eight, and even ten children, hardly more than a year between their ages, driving their poultry, pigs, and cattle on board the boat, and, after distributing themselves as pilots, draggers, feeders, cooks, cleaners, and general directors, glide off on the canals as if they were sailing on purple seas to the Islands of the Blessed.

The foundations of Amsterdam no longer rest on herring bones. Two thousand vessels were once annually sent out from Holland on the herring fisheries, and now two hundred would cover the entire number engaged in the trade. Holland, like Amster-

dam, has changed, but changed with the spirit of the time, and has now a new growth. Holland no longer regulates the exchanges of the world; no longer controls the commerce of the ocean; no longer, with her brave and sturdy sailors, rules the sea; no longer sets financial fashions to all Europe; no longer holds the mighty purse which kings must win before declaring war; no longer from her sluices and canals sends out her golden argosies that stretched her power and fame to every quarter of the globe. But still she is great in her dwarfed proportions; great in the industry, perseverance, and spirit of her people, whom all the surges of the sea can not daunt, and all the strength of the Spaniards in the height of their pride could not overcome. She is small, but she is firm and free, and has taught both hemispheres by her example what earnestness and determination may accomplish. She has no dreams of glory in these days; but she steadily pushes her conquest of work in every direction, and girds, as she has ever girt, her honest brow with the unfading laurels of unfailing labor and unflinching heart.

A STRANGER IN THE PEW.

Poor little Bessie! She tossed back her curls,
And, though she is often the sweetest of girls,
This was something she couldn't and wouldn't endure;
'Twas the meanest, most impolite act, she was sure,
And a thing, she declared, that *she* never would do:
To go to a church where one didn't belong,
Then walk down the aisle like the best in the throng,
And seat one's self plump in another one's pew.

Humph! Didn't her father own his out and out,
And didn't they fill it up full, just about,
When mamma and papa, and herself and the boys,
Were seated? And didn't their boots make a noise
In moving along to make room for a stranger?
And wasn't it cool, with the brazenest face,
To expect at each hymn pa would find out the place
(If Ben didn't, or Bob, but there wasn't much danger)?

With such feelings at heart, and their print on her face,
Last Sunday our Bessie hitched out of her "place"
To make room for a girl, very shabby and thin,
Who had stood in the aisle till mamma asked her in.

The poor little thing tried her best not to crowd;
And Bessie, forgetting, soon had the mishap
To slip from her drowsiness into a nap,
From which she awakened by crying aloud.

"WHEN, ALL IN A MOMENT, THE MUSIC GREW LOUD,
AND ON IT CAME FLOATING A BEAUTIFUL CROWD."

Poor Bessie sat upright, with cheeks all aflame
At sleeping in church, and we felt for her shame;
But 'twas strange at the close of the service to see
Our Bessie, now gentle as gentle could be,

Take the hand of the shabby young girl in the pew,
And walk with her out of the church with a smile
That shone through the tears in her eyes all the while,
And brightened her face with a radiance new.

"Good-by," whispered Bessie at parting, "and mind
Our pew's forty-five, with a pillar behind."

Then she stole to her mother: "Oh, mother, I dreamed
Such a curious dream! 'Twas no wonder I screamed.

I thought I was sitting in church in this dress,
With a girl like a beggar-child right in our pew—
We were sitting alone on the seat, just we two—
And I felt more ashamed than you ever could guess;

"When, all in a moment, the music grew loud,
And on it came floating a beautiful crowd;
They were angels, I knew, for they joined in the song,
And all of them seemed in the church to belong.

Slowly and brightly they sailed through the air;
The rays from the window streamed crimson and blue,
And lit them in turn as their forms glided through;
I could feel their soft robes passing over my hair.

"One came to my side. Very sadly she said,
'There's a stranger in here.' I lifted my head,
And looked at the poor, shabby girl with disdain.
'Tis not she,' said the angel; 'the haughty and vain
Are the strangers at church. She is humble and true.'
Then I cried out aloud, and the minister spoke,
And just as they floated away I awoke,
And there sat that dear little girl in our pew!"

FROM A BARN TO DRURY LANE.

A LITTLE less than a hundred years ago the great actor Garrick heard rumors of the beauty and genius of a young girl, the daughter of a strolling player, whose impersonations had completely turned the heads and captivated the hearts of the provincial audiences before whom she appeared. Ever on the alert to secure first-rate talent for his theatre—for Garrick was above the jealousy which is characteristic of modern stars—he sent an agent to ascertain the truth in regard to her performances. Dissatisfied with his report, in the month of August, 1775, he sent a second emissary to make further observations. This was the Rev. Mr. Bate, who is described as a clergyman of strong intelligence and vigorous style, and of a strength of muscle which would have entitled him in these days to the honor of the championship of "muscular Christianity." He was not only well up in stage matters, and a slashing theatrical

critic, but an accomplished boxer and duelist. His letters giving the report of his expedition are preserved in the British Museum, and are singularly interesting and vivacious.

After traveling over "some of the cursedest cross-roads in the kingdom"—the Rev. Bate could use strong language upon occasion—he arrived at the town of Worcester, and there saw the new theatrical wonder, for the first time, playing Rosalind. He stood at the side wings of the theatre, which he describes as a sort of barn, the stage being only about three yards deep. Yet, even under these disadvantages, he was enchanted with her playing, and at once pronounced that she would be a valuable addition to the ranks of Drury Lane.

The actress was Mrs. Siddons, the daughter of Roger Kemble, a strolling player.

The English strolling player of that time, with his *entourage* and wandering vocation,

MRS. SIDDONS IN THE CHARACTER OF THE TRAGIC MUSE.

formed an epitome of all that is contemptible and degrading. He lived in abject terror of the law, and might be classed lower than the tramps who in our day infest the purlieus of the race-course and the circus. The shifts, meannesses, and pretenses of this unhappy pariah were a perpetual invitation to the great satirists of the age, such as Churchill and Hogarth, who lavished their most pitiless raillery on victims who to us appear to have been unworthy of their notice. Barely tolerated for the night in some empty barn, and hunted from the village in the morning by terror of the stocks, these poor wretches make a spectacle to excite nothing but contempt and laughter. The company would arrive at a rural town with-

out money, and generally destitute of provisions. Some coach-house or barn, or, in rare cases, a room at the inn, was lent to them. In more remote days the open inn-yard, with its antique galleries running round, was sometimes taken for the presentation of the play; and indeed this is thought to have furnished the model on which modern theatres are constructed. All sorts of odds and ends of furniture and finery were borrowed or stolen to make a show, a few candles were stuck round to furnish light, and thus the performance took place. The result was too frequently a number of small debts for board and lodging, or hopeless insolvency, with a flight from town after dark.irate landladies sometimes anticipated this

ROGER KEMBLE.

catastrophe by seizing some wretched article of clothing while the owner lay in bed; and the spectacle of the demoralized player flying from the house, clad in fluttering rags whose scantiness barely concealed his nakedness, was likely to add to the stock ridicule against his caste. Sometimes their miserable stage properties were seized and forfeited. There were generally pleasant, jovial creatures among them, who, in return for a supper or a pot of ale, told their adventures, and turned the heads of the simple village lads by vaunting the glories of the stage. They led a true Bohemian life, and were happy in their squalid wretchedness.

One of these dramatic vagrants, Ryley by name, has written a strange and incoherent account of this sort of life, extending over nine bulky volumes, which forms a most degrading record. We here see the strollers,

after a disastrous week, quitting the town on credit, having found indulgent tradesmen, and being actually "trusted" for the chaises which took them away. But this was a rare humanity. We see "Mrs. Long," on the eve of a "bespeak," or "benefit," dressing up her eight children in scarlet, and taking them round to distribute bills, with the most successful result. The "bespeak" system, with the respectful waiting on patrons, obtained to a very recent time, as we learn from *Nickleby*; and Wilkinson describes the genteel actor panting eagerly along the road after the mounted gentleman, and forcing play-bills on him.

Sometimes a young girl falling in love with some wandering Romeo caused a village scandal. Servants became demoralized during the company's sojourn, and property was missed, as in the case of gypsy visits.

JOHN P. KEMBLE.

In short, these theatrical visitors were considered as mountebanks, plagues, and nuisances by the justices—who thus classed the interpreters of the drama with the tramps and vagrants who gave them so much trouble. It is hardly surprising, therefore, that the strollers should be sternly dealt with by the rigid Puritans of the bench, or that when the increasing bands of showmen, hawkers, mountebanks, and tumblers wandered like thieving mendicants through the country, the itinerant players should be designated in acts of Parliament as “vagrants.”

A once famous harlequin and player, by

the name of Lee Lewes, has revealed many grotesque scenes from the life of the stroller. In his pages we see the “Priest of the Sun” stride forward over the rough barn floor, a borrowed bed-curtain draped about him, and a pine box for his altar; or the player, performing in “Mr. Coote’s Malt-house,” finds his boot sink in the soft clay as he declaims, and must leave it there. But what befell Elrington, an Irish actor of some mark, is more significant. Opening a small theatre at Manchester, he proposed conciliating all voices by a proclamation that the first receipts were to be given over to a new hos-

CHARLES KEMBLE.

pital. On this he and his troupe were dragged before the justices, and *chasséd* from the town forthwith, for daring "to insult the subscribers to that institution." And one pleasant member of the Kemble family used to tell how, when walking with the provincial mayor of an Irish town, he was puzzled by some persons, who persisted in bowing repeatedly, in a fashion that seemed almost like prostration, before the functionary, who took no notice whatever. At the next street they found the same sycophants waiting, who again ran on and repeated their salams, until the mayor at last said, indulgently, "I see you—I see you!" These were strollers.

In after-years, when celebrity and wealth had taken the sting from the recollection,

John and Stephen Kemble were fond of recalling the grotesque incidents of their early career as members of a band of vagrant players. With a grim humor peculiarly his own, John would tell of a highly critical stroller who held the opinion that Kent in "King Lear" was a doctor, and appeared on the stage with grizzled wig, black suit, a cane held to his nose, and a box under his arm. He would support his view by the passages:

"Do kill thy *physician*, Lear!"
 "To new climes my *old trunk* I'll bear."

The trunk, he said, being the medicine-chest. Stephen Kemble overflowed with such sketches. He used to describe, with

infinite humor, a season of privation in a wretched village, where the poor strollers could not muster a farthing, and where the unhappy beings, of whom he was one, were baited by furious landladies. To avoid this persecution he lay in bed two days, suffering the pangs of hunger; and then his only resource was a distant turnip field, to which he was persuaded to bring a brother actor, boasting of the "hospitality" of the establishment they were going to, its vast size, and thus raised the hopes of his unfortunate companion, until the disclosure was made that it was a turnip field.

Roger Kemble was manager of a company of these unhappy comedians. It was reported in the profession that he began life as a hair-dresser. He claimed to belong to an old English Catholic family which had furnished martyrs to Protestant intolerance; and his old-fashioned courtesy of manner, his ambitious views in regard to his son, and the well-cut and refined features of all his children, seem fair evidence of good breeding and extraction. Early in life he had joined a band of strollers, and married the daughter of the manager, an Irish actor. The lady was very handsome, and, we are told, "had once been tempted by a coronet." Her father vehemently opposed the match, but when he found opposition was of no use, he reluctantly consented, consoling himself with a rough thrust at his new son-in-law. He had wished her, he said, not to marry an actor, and she had complied with his wishes.

The fruit of this marriage was twelve children, of whom Sarah and John Philip were the eldest and greatest. Most of them were born on the circuit; only eight attained maturity. Sarah, the most gifted and famous of the family, was born in Wales, July 5, 1755. At the proper age she was sent to respectable day schools in the country towns to which the circuit brought the troupe. A very aged lady, alive a short time ago, recalled perfectly how the young girls in one of these schools were inclined to look down on the "play-actor's" daughter, until, some private theatricals being set on foot, her histrionic taste and experience put her forward, and made her services extremely valuable. She won universal popularity by exhibiting a device for imitating a "sack-back" with the thick paper that covers sugar-loaves. But her education must have been of a fitful sort, for the manager could not well afford to forego the assistance of a clever girl. Even when she was almost a child the future Mrs. Siddons was announced, on some benefit, as a sort of "Infant Phenomenon," to add to the attractions of the evening. As she came forward, some confusion arose in the gallery which overpowered all her attempts. Then her mother, who was a woman of promptness and spirit, led her down to the footlights, and made her recite the fable of "The

Boys and Frogs," which at once lulled the tumult and restored good humor.

Wherever the troupe went the young girl, who was a great beauty, attracted attention and admiration. Her coquettish singing of "Robin, sweet Robin," enslaved the heart of a wealthy squire, who proposed for her hand. The willful beauty was then engaged to be married to an actor by the name of Siddons. Fearful of the superior attractions of the squire's purse, her lowly admirer proposed an elopement. She refused, and he was dismissed from the troupe; but being allowed the compliment of a farewell benefit, he meanly took advantage of it to recite, in doggerel verse, the story of his wrongs. A hearty boxing of the ears from the angry mother of the young lady awaited him at the wings as he retired from the stage. But Sarah proved constant and forgiving. After spending a few months in retirement as lady's-maid to a Mrs. Greathead, she won her father's consent to their union, and they were married in November, 1773.

For two years subsequent to her marriage Mrs. Siddons and her husband remained connected with Roger Kemble's company of strolling players. While playing in the "Fair Penitent," at the Cheltenham Theatre, she was closely observed by an emissary of Garrick's, who gave his employer a favorable account of her talents. Later, as already mentioned, the great actor dispatched the fighting clergyman, Bate, to make a more careful report. The result was an engagement at Drury Lane at a salary of five pounds a week. Jealousy on the part of older actresses, want of stage cultivation and experience, and a deficiency of power and variety in the tones of her voice, combined to make the engagement a failure. Then came the change in the proprietorship of the theatre, on Garrick's retirement from the stage, which brought with it a cold announcement that her services were no longer required. The blow was almost crushing. Her pride not alone was hurt, but the thought of her helpless children drove her to the verge of distraction.

But she soon recovered, and, filled with the gallant purpose of retrieving her reputation, bravely commenced a series of engagements at the provincial theatres. After a very successful season at Manchester, she accepted the offer of an engagement at the York Theatre, where she soon eclipsed all competitors, and gained immense popularity. Every body was astonished that such genius should have been neglected by a London audience. The manager fondly clung to the hope that he could secure her as a permanent member of his company. His chief dependence lay on the finery which he had provided for her Lady Alton, which was a most "elegant full sack-back, all over silver trimmings," and with which she was

MRS. SIDDONS IN HER THIRTIETH YEAR.

so pleased that she used to say she would like to take it on to Manchester. Her engagement at York was followed by one equally brilliant and successful at Bath; and in 1782 she was invited to return to Drury Lane. This was a genuine triumph of talent and conscientious work, and it was received by Mrs. Siddons with pardonable exultation.

The management of Drury Lane was then in the hands of Sheridan, who was not above the small arts in which managers of the present day rival the vendors of quack medicines. All that variety of "puffs" on which he had been so merry and witty in his own burlesque were diligently scattered over the town, and were to be found in every newspaper that he could control. The announcement of her engagement was proclaimed at the foot of the play-bills for weeks. From these exertions much, no doubt, was expected; but neither he nor the public was prepared for the tremendous success that was to follow.

The great actress herself tells the story of

her hopes, fears, and final triumph with touching simplicity and modesty. The play selected for her *debut* was "Isabella"—a fine though ponderous drama, full of gusts of passion and the very deepest tragedy. For one gifted with the tragic powers of tenderness, grief, and rage, nothing better could have been chosen. At one of the rehearsals an incident occurred which, though trifling, must have afforded her infinite encouragement. Her little boy, who was to take a part in the play, was so affected by her acting that he took it for reality, and burst into passionate crying, thinking he was about to lose his mother. This satisfactory proof of effect deeply impressed the actors and the manager, and Sheridan had the story conveyed to friendly newspapers.

The evening came, and every thing was favorable. There was a vast house, crammed to the roof, and extraordinary excitement and curiosity. Though she had been acting for years, she was almost unnerved. When she found herself on the stage she felt, she said, "the awful consciousness that one is

the sole object of attention to that immense space, lined, as it were, with human intellect from top to bottom, and all around—it may be imagined, but can never be described, and by me can never be forgotten!” But she had no need to be apprehensive. Her acting was one continued triumph. As the pathetic piece moved on she took possession of the audience. The tenderness and exquisite sweetness of her tones went to every heart, the agony of suffering and grief thrilled all present. At times she had all men’s eyes suffused with tears, and many women in actual hysterics. Toward the last act there was scarcely a speech of hers but what was interrupted by tumultuous and passionate bursts of applause, until the whole house seemed swept away in transport.

We must quote her own quiet and grateful description of the scene that followed, which shows the character of the woman in such pleasant colors :

“I reached my own quiet fireside, on retiring from the scene of reiterated shouts and plaudits. I was half dead ; and my joy and thankfulness were of too solemn and overpowering a nature to admit of words, or even tears. My father, my husband, and myself sat down to a frugal, neat supper, in a silence uninterrupted except by exclamations of gladness from Mr. Siddons. My father enjoyed his refreshments ; but occasionally stopped short, and laying down his knife and fork, lifting up his venerable face, and throwing back his silver hair, gave way to tears of happiness. We soon parted for the night ; and I, worn out with continually broken rest and laborious exertion, after an hour’s retrospection (who can conceive the intense-ness of that reverie ?), fell into a sweet and profound sleep, which lasted to the middle of the next day. I arose alert in mind and body.”

“Isabella” was succeeded, after a run of eight nights, by the “Grecian Daughter,” a stilted play, but with a substantial basis for the display of tragic talent. Then followed “Jane Shore,” in which her acting was so intense as to throw some of the audience into hysterics. Other tragedies of the same kind were successively put on the stage ; and during a season of about eighty nights she was wailing and mourning and raging through all the gamut of histrionic woe. The strain upon her nervous system was prodigious. But the managers were liberal. Her profits for the season were about fifteen hundred pounds. Honors, too, and titled patronage, became hers. The street before her lodgings in the Strand was crowded with the coaches of the nobility coming to call upon her. And from that time, during the course of a long life, the friendship of titled people was always hers to an extraordinary degree. The king and the royal family took the deepest interest in her.

From the scene of these gratifying triumphs Mrs. Siddons set out on a tour in Ireland. Success every where waited on her appearance ; but she formed a most unfavorable impression of the country, and seems to have excited the jealousy of actors and crit-

ics wherever she played ; and on her return to England she was pursued with burlesques and caricatures. Scarcely less annoying to her sensitive nature was the fashionable social homage to which she was subjected. Every one was eager to see and know her, and as she passed from the stage door, crowds always assembled to gaze at her and make remarks on her appearance. More agreeable were her associations with such men as Dr. Johnson and Sir Joshua Reynolds. At the dinner-table of the great portrait-painter she often met the highest representatives of the rank, wit, fashion, and learning of the time. It was on one of these occasions that Sir Joshua conceived the idea of painting her in the character of the Tragic Muse, of which picture an engraving is herewith given. The painter, who was an enthusiastic admirer of her performances, was highly gratified at her style of dress—a short waist, instead of the long, stiff stays, her hair generally laid close in little curls and braids, so as to display the shape of the head. At the theatre he always sat in the orchestra, in a line of famous men—Burke, Gibbon, Sheridan, Windham, and Fox, down whose dark cheeks the tears were often seen trickling. These eminent men would all find their way to her dressing-room, to pay their respects. Even the doubtful compliment of his Royal Highness the Prince of Wales’s approbation was often offered to her. The same precious testimonial had been recently bestowed on an actress of the same house, the unfortunate *Perdita* Robinson ; but to the majestic Muse of Tragedy he dared make no profane advances. Indeed, she was always on her guard, and, as was said later of her, one would as soon think of making love to the Archbishop of Canterbury.

There was always a chair ready at the wings for Dr. Johnson whenever his health permitted him to visit the theatre. Only a year before he died he sent a friend to the actress to beg that she would do him the honor of taking tea with him. She felt the compliment, and with her brother visited the doctor, who received her with true old-fashioned courtesy. There being no chair at hand for her to sit down, he excused the deficiency by saying, with a smile, “Madam, you, who so often occasion a want of seats to other people, will the more easily excuse the want of one yourself.” When chairs were brought he seated himself beside her, and unlocked the gates of his old theatrical recollections—of those days when he had been a play-goer and critic, and had seen his friend “Davy” act, and Mrs. Clive and Mrs. Porter and Mrs. Pritchard. He dwelt specially on Garrick’s merits in both tragedy and comedy, turned then to the subject of Shakspeare’s plays ; and as she spoke of acting Queen Katharine, his favorite part, he expressed his wish to attend and see her.

"But," said he, "I am too deaf and too blind, and could see or hear no farther off than the stage-box, and I have little taste for making an exhibition of myself in such a conspicuous situation." On this she proposed the chair at the wing, when the doctor was much flattered, though the opportunity was never to come. He was greatly pleased with her, and wrote to his friend Mrs. Thrale, a little after what Goldsmith would have called his "bow-wow" manner, that "she had behaved with great modesty and propriety, and left nothing behind her to be censured or despised." He was also pleased to notice that she had not been depraved by either money or praise, and looked forward to seeing her again. Mrs. Siddons often visited the doctor after this. He always treated her with the same old-fashioned ceremoniousness, and on every occasion repeated the same formality, conducting her to the head of the stairs, holding her hand respectfully, and saying, with a bow, "Dear madam, I am your most humble servant." Though it used to be the fashion to speak of this man as uncouth, boorish, and bearish, there was more true politeness in him than in a score of Chesterfields.

But her success was attended by many drawbacks. She possessed one unfortunate characteristic—a thorough contempt of the outside world, which brought her into many difficulties, while she was always prone to ascribe her troubles to the jealousy and machinations of others. Thus nothing could divest her of the belief that Garrick was the cause of her early failure at Drury Lane. She constantly made enemies on the press and in the ranks of her own profession. A second visit to Dublin was productive of many annoyances. She was piqued at the preference shown to other actresses. It was alleged that she had refused to play for a worthy aged actor, and it was solemnly stated that "there was a general opinion abroad that the softer virtues of humanity did not reside in her breast." On her return to England it became her fate to be dragged into an unpleasant publicity; and when she appeared again on the Drury stage she was received by the audience with a burst of hooting and hissing that to a more timid person would have been appalling. But the brave woman quailed not for a moment. Her brother led her forward to the foot-lights, but this only increased the storm, and she retired, to fall fainting in his arms from excitement. After a few moments' rest the curtain again rose, and amidst a silence in strange contrast with the tumult that had just subsided, she addressed the audience in a few well-chosen words. "The kind and flattering partiality," she said, "which I have uniformly experienced in this place would make the present interruption distressing to me indeed were I conscious of having deserved your censure.

The stories which have been circulated against me are calumnies. When they shall be proved to be true, my aspersers will be justified; but till then my respect for the public leads me to be confident that I shall be protected from unmerited insult." The effect of this speech was magical. The audience applauded with enthusiasm. Mrs. Siddons then withdrew for a few minutes to recover herself. She then reappeared, and went through her part triumphantly. The play was "The Gamester." It is almost needless to say that the frivolous charges of inhumanity were completely disproven.

Mrs. Siddons gives an interesting account of her first representation of Lady Macbeth at Drury Lane. She had studied the character with great care until she had worked out a grand, consistent, and effective theory, on which her personation was based. But a wretched actor was put on to play Macbeth, and an incident occurred just before the play began which utterly discomposed her. It was her custom, as it had been that of Garrick, to devote some time before the curtain rose to a sort of "retreat," during which she composed herself to think only of the character which she was to assume. On this eventful evening—but the story is best told in her own words:

"Just as I had finished my toilet, and was pondering with fearfulness my first appearance in the grand, fiendish part, comes Mr. Sheridan knocking at my door, and insisting, in spite of all my entreaties not to be interrupted at this to me tremendous moment, to be admitted. He would not be denied admittance, for he protested he must speak to me on a circumstance which so deeply concerned my own interest that it was of the most serious nature. Well, after much squabbling I was compelled to admit him, that I might dismiss him the sooner, and compose myself before the play began. But what was my distress and astonishment when I found that he wanted me, even at this moment of anxiety and terror, to adopt another mode of acting the sleeping scene! He told me that he had heard with the greatest surprise and concern that I meant to act it without holding the candle in my hand; and when I argued the impracticability of washing out that '*damned spot*' that was certainly implied by both her own words and by those of her gentlewoman, he insisted that if I did put the candle out of my hand it would be thought a presumptuous innovation, as Mrs. Pritchard had always retained it in hers. My mind, however, was made up, and it was then too late to make me alter it, for I was too agitated to adopt another method. My deference for Mr. Sheridan's taste and judgment was, however, so great that, had he proposed the alteration while it was possible for me to change my own plan, I should have yielded to his suggestion; though even then it would have been against my own opinion, and my observation of the accuracy with which somnambulists perform all the acts of waking persons. The scene of course was acted as I had myself conceived it, and the innovation, as Mr. Sheridan called it, was received with approbation. Mr. Sheridan himself came to me after the play and most ingenuously congratulated me on my obstinacy."

Her triumph was complete. The care with which she acted is revealed by a diverting anecdote:

"While standing up before my glass," she says, "and taking off my mantle, a diverting circumstance occurred to chase away the feelings of this anxious

MRS. SIDDONS AS LADY MACBETH.

night; for while I was repeating, and endeavoring to call to mind the appropriate tone and action to the following words, 'Here's the smell of blood still!' my dresser innocently exclaimed, 'Dear me, ma'am, how very hysterical you are to-night! I protest and vow, ma'am, it was not blood, but rose-pink and water; for I saw the property-man mix it up with my own eyes.'"

Our limits will not permit us to follow Mrs. Siddons through her career as an actress; and we must content ourselves with culling a few pleasant anecdotes connected with her later years, which we find in Fitzgerald's pleasant work on the Kemble family, from which we have drawn the substance of this article, as well as the illustrations.

During an engagement at Leeds she played with the elder Mathews, who describes what she suffered from the barbarous frequenters

of the galleries. When she was about to drink the poison, one called out, "Soop it oop, lass!" When she was playing the "sleeping scene" in "Macbeth," a boy, who had been sent for some porter, walked on to the stage and presented it to her. In vain the great actress motioned him away; in vain hoarse voices called him off. The house roared; the whole play was spoiled. No wonder, when the curtain came down, on the last night of her engagement at Leeds, that she said, "Farewell, ye Brutes!"

There are many agreeable little pictures in her provincial travels, and none more graphic than one drawn by Miss Burney, of the little Weymouth theatre, when the king and royal family were stopping there. The

author of "Evelina" tells how she met the stately actress walking on the sands with her children, and received an obeisance as stately; how the aged king commanded a performance at the theatre, and the royal family being away on an expedition, kept the packed audience waiting; how the farce was put first; and how the king and queen arriving at last, they sent a page home for their wigs, so as not to detain the audience further.

The retirement of Mrs. Siddons from the stage, when through increasing years and bodily infirmities she had become incapable of sustaining her favorite characters, took place in 1812. The 29th of June was fixed for her last appearance, and "Macbeth" was selected as the play in which she was to take farewell of the scene of so many splendid triumphs. The excitement was unprecedented. The theatre was crowded, and the applause tumultuous. When the "sleep-walking" scene was concluded the audience rose, and insisted upon the play stopping there. The wish was gratified, and the curtain fell. When it rose, after a short interval, the great actress was discovered dressed in white and seated at a table. Coming forward, she received an impassioned greeting, and with great emotion recited a farewell address. She was much agitated; and at the conclusion her brother John came forward to lead her away. Then the curtain descended slowly, and shut her out from what, after all, must be one of the most seductive and entrancing worlds, compared with which all the placid enjoyments of well-earned rest and retirement must seem tame and insipid. But for one like her, who commanded applause, and secured, perhaps, the highest appreciation ever awarded to an actress, it must have been almost like a foretaste of death.

Now she was to feel the blank that succeeded the splendid and almost supernatural excitement of the stage. Long afterward she confided to Moore, with an *épanchement du cœur* which made him feel the deepest interest in her—the only time she had ever done so off the stage—how bitterly she felt the desolation. To Rogers she complained of the *ennui* that came upon her during the long evenings when she had to sit at home. She was thinking, she said, "Now I used to be going to dress; now the curtain is about to rise!" Then came the memory of the uproarious greeting as she appeared on the stage; and so strong was the spell upon her mind that several times after this formal retirement she allowed herself to be lured upon the stage. It brought upon her the bitterest mortification. Hazlitt and other critics attacked her with merciless severity; caricaturists made her ridiculous by contrasting her fat, unwieldy person with the graceful forms of younger favorites; and the

public, always forgetful and cruel, laughed and jeered at the spectacle. In private life she was beloved by all who had the pleasure of her acquaintance; and her death, which occurred in 1831, revived all the pride with which she had once been regarded by her countrymen.

Of the male members of the Kemble family, one only, John Philip, rose to eminence on the stage. Stephen's chief claim to temporary notoriety was that he could play "Falstaff without stuffing." Charles was an elegant and cultivated but not a great actor, and his life was uneventful and uninteresting. John was but little younger than the sister with whose fame his own was intimately associated. He also, as stated in the earlier part of this article, began as a strolling player, and by force of talent and studious culture of his great natural powers, became one of the foremost actors of the age. He had always a studied instead of a passionate or sympathetic manner. An air of over-elaboration appeared in all his playing.

His manner, according to Hazlitt, had always in it something hard, dry, and pedantic. He lacked spontaneity, and was so ponderous in his love-making on the stage as to excite derision. Leigh Hunt makes Apollo say, in the "Feast of the Poets,"

"By Jove,

I'd as soon have gone down to see Kemble in love!" as if that were the acme of tediousness. His peculiarities and mannerisms contributed largely to the amusement of the town. "I have known him," says Leigh Hunt, "make an eternal groan on the interjection *Oh!* as if he were determined to show that his misery had not affected his lungs." His pronunciation was capricious and peculiar. *Virtue* and *merchant* became *varchue* and *mar-chant*. Hunt pleasantly supposes Kemble to recite the following lines:

"For since the soul that pierces mine,
Sweet Myra's soul, is full of thine,
In my breast too thy spirit stirs,
Since all my soul is full of hers;"

which in the great actor's mouth would be transformed into:

"For since the soul that *purses* mine,
Sweet Myra's soul, is full of thine,
In my breast too thy spirit *stares*,
Since all my soul is full of *hairs!*"

He was accustomed to drawl on emphatic words in such a way that they might have been measured by a stop-watch. Once he introduced a disagreeable reading in *Macbeth*—"magot-pies" for "magpies"—and then, observing the disgust of his audience, deliberately repeated the obnoxious phrase, as if he would force it down their throats. His ponderous manner is well described by Scott, after seeing him play *Hamlet*. He said that the Dane's natural melancholy placed him within Kemble's range, yet that many delicate and sudden turns of passion slipped

STEPHEN KEMBLE AS FALSTAFF.

through his fingers. He happily described him as "a lordly vessel, goodly and magnificent when going well before the wind, but wanting facility to go about."

Kemble was educated at Douai for the Catholic priesthood; but, after nearly six years' residence in the seminary, concluded that he had no talent for that vocation, and set out in search of his family. His father refused to receive him; and when the company made up a small purse to relieve his necessities, old Roger Kemble was with difficulty persuaded to add a guinea. He set out with a companion in search of another company. On Christmas-day they found themselves at an inn, without a penny, and unable to proceed further. On this emergency it was agreed that two letters should be written—one in Latin, to the parson (for which Kemble was, no doubt, responsible); the other in English, to a lawyer in the neighborhood; and it was expected that the sense of peace and good-will reigning on the

earth that day would soften the receivers' hearts, and induce them to send money. The adventurers were successful. His early career was full of the traditional privations of the craft. Sometimes, when reduced to straits, he appeared in odd situations; and one of the stories of the profession was that he had taken up the character of a Methodist preacher.

The subsequent career of John Kemble—his elevation from the rank of a strolling player to that of a "dramatic star" of the first magnitude, his position as manager of Drury Lane Theatre under Sheridan, and his dissensions with that brilliant but irregular genius—presents a thousand points of interest, upon which our limits will not permit us even to touch. Certainly the whole range of theatrical biography does not contain a more fascinating chapter than that which records the progress of Sarah and John Kemble from the rough boards of a village barn to the stately stage of Drury Lane.

THE DANISH WEST INDIES.

MARKET SCENE IN ST. CROIX.

WHEN that astute statesman, William H. Seward, convinced of the necessity that the United States should possess a convenient harbor in the Caribbean Sea, proposed the purchase of the Danish West Indies, there was developed quite a universal ignorance of these neighboring islands, one of which, at least, was deemed sufficiently important, as fulfilling required conditions, to be considered a candidate for annexation. But whether or not this consummation, so devoutly desired by the intelligent portion of their inhabitants, will ever now be achieved, after all the tortuous twistings of diplomacy, which has apparently set the question aside, time and increasing contingencies only will determine; while of the numerous corps of invalids who annually seek warmer climates, there will always be a few whose thoughts and footsteps will turn thitherward in search of restoration and lengthened days, so that some account of a winter's experience in these bright tropic places may be acceptable to those who are obliged to fly from our gray

Northern winters, and may supply a less vague impression of our future probable colonies than is generally entertained.

We started from New York in the Brazilian mail steamer, leaving behind us sharp blasts and snow; in two or three days we were sailing upon summer seas, and at the end of a week were anchored beneath the Southern Cross, which, by-the-way, is a comparatively insignificant constellation, much overpraised for size and brilliancy.

We landed on St. Thomas at the wharf attached to Bonelli's "European Hotel," which was reached by a long, flagged alley-way, and presented the usual characteristics of West India houses—windows with green jalousies and no glass, and bare floors, with old-fashioned and rather shabby furniture, and not much of it. From one side of our apartment we had our first view of tropical scenery, in a landscape that seemed the exact counterpart of the illustrations to "Paul and Virginia" which delighted our childhood. Emerald and irregular hills, crowded with low, white villas, surrounded with luxuriant verdure, among which was the home of Santa Anna; a sloping road of shining sand winding downward among brilliant flowers and clustered foliage, from the midst of which a stately cocoa-palm here and there raised its bare stem and crowning branches;

and all the sunny path swarming with negroes of all sizes, carrying burdens of every description on their heads or showy turbans. On the other side we looked up the narrow court-yard, bordered on one hand by a row of brown sheds, and on the other by quarters for laborers, in a window of one of which a chained monkey frisked incessantly, while in another an aged parrot indulged in perpetual Spanish profanity; while in front of a door a woman was washing clothes, after the manner of the country, beating them upon stones with a wooden bat, or mallet; and chattering with her was another specimen of colored female, clad in a bright pink calico dress and yellow turban, with a long cigar in her mouth.

Before morning we were convinced that we had arrived in an efficient locality for improving our knowledge of entomology: mosquitoes swarmed the air, gnats and fleas afflicted us temporarily with St. Vitus's dance, while bugs and beings for which we had no names made themselves personally acquainted with the sanitary condition of our systems; we found roaches in our shoes, spiders in our hats, beetles in our sleeves; and in consequence of a wholesome dread of scorpions, with which friends at home had primed our minds, we had tarantula on the brain for two or three days, being on the continual look-out for these fearful creatures, until informed by natives that their proportions had been exaggerated to us, that injury from them is not frequent, and, save in exceptional cases of predisposition of the blood, rarely fatal.

The town of St. Thomas is the largest commercial emporium of the West Indies, and is quite a city, of about four thousand buildings; the stores are all entered from the unpaved street through arched porches, and many of them are extensive and well-furnished; the spacious harbor, so admirable in shape and situation, is always crowded with shipping, as the town is a free port; notwithstanding which, however, no person can leave the island without procuring a passport, which is of no use to the traveler, but affords a revenue to the government; so that before going to St. Croix we were obliged to pay two dollars each to a Danish official for the privilege.

We made the passage in a little propeller, which occasionally plied back and forth, as it received passengers sufficient to pay for the coal, and had full and disagreeable experience of the winter trip between the Caribbean islands upon the short, chopped, and high sea; and those who have also crossed the British Channel, so celebrated for making tourists uneasy, insist that it is not so rough and trying as this sunny Southern ocean.

The approach to St. Croix upon the side we entered is very lovely; the island, partly of volcanic formation, curves round the bay

in the shape of a horseshoe, almost in the centre of which, white and gleaming among green trees, is the port of Christiansted, or Basin, as it is generally entitled, with a French pronunciation. The whole surface is composed of ranges of graceful heights, which are broken into continual undulations, grassy slopes, dales, and dells, where the changing lights and shadows from fleecy clouds produce ever-varying effects, of which the watching eye never wearies. The bay and surrounding ocean present one broad sheet of malachite green, with here and there wide belts of rosy tinge, edged with white breakers, where the coral reefs make the waters shallow, and danger is indicated by numberless buoys, while groups of snowy flying-fish float over the waves like flashes of foam, springing thus from their native element when pursued by their enemy, the hungry dolphin.

We were obliged to undergo some examination of our luggage at the custom-house; for though there is no such establishment at St. Thomas, St. Croix helps to make up the deficiency to the home government, as even upon articles purchased in the other islands there are charged exorbitant duties. After visiting the Government House—a very handsome building, and the only one of any architectural pretense on the island, and which contains a fine ball-room, ornamented at one end with a full-length portrait of the Danish king—we set out upon a drive of two and a half hours across the island, and over superior roads, which are kept in excellent order, and are the pride of the place. Novel sights and charming bits of scenery kept us amused and interested during the ride, which led, at intervals, through miles of sugar fields, whose waving plants resemble our Indian corn, with the long dark green leaves and pale lilac tassels shooting up a foot from the stem, except that occasionally the delicate blue blossoms peeped between ridges of stalks like the “forget-me-nots” of our own far-off land. All these fields are bordered with straight rows of cocoa-palms, as if their stateliness was guard enough for sweetness, or hedged with prickly caeti, interspersed with tamarind, banana, or mahogany trees, though the number of these annually becomes fewer, owing to the scarcity of other fuel, and a strange blight that fell upon the palms for two or three years before the earthquakes.

There were many blacks, who generally work in gangs of a dozen or more of both sexes, preparing the ground for the cane, and using for the purpose old-fashioned hoes and rakes, though one good plow and four pairs of oxen would more thoroughly break as much land as fifty such workers with their tedious and preferred implements. Near by, the overseers, who are frequently Irishmen, sat on their horses and lazily watched the loi-

"THE ROADS WERE FULL OF THESE EBONY LABORERS."

tering laborers, the whole presenting a different picture from Northern goaheadativeness. Later in the day, as the time came for occupation to cease, the roads were full of these ebony laborers, all homeward bound, and having burdens of various descriptions on their heads, generally piles of refuse for the pigs, or overhanging bundles of coarse grass for their horses, while occasionally the rude "emancipation carts" would rattle by with their load of laughing faces, though the ordinary expression of the colored people is grave, and often sullen. The walk of the countrywomen, who support on their skulls packages of much greater weight than they could possibly convey by hand, is odd and peculiar; and they frequently display upon their bare limbs cases of elephantiasis, a disorder which swells the legs and feet to an unsightly and painful degree. Every one spoke to us in passing, of both colors—a pleasant established custom, that makes a sociable impression on a stranger; though the few white inhabitants are seldom seen abroad, except in the early morning or late in the afternoon, when the heat is not oppressive; but one can not but feel and acknowledge that the dark skins fit into each vivid and sunny scene with more appropriateness than the figures of "pale-faces;" they seem to form natural accessories to a view, while the appearance of one of the higher race strikes the eye as an addition insulated and detached from the tropical surroundings.

Most of the dwellings seen from the roads, with the scattered exceptions of some occasional large houses upon bordering estates, are the small and often squalid tenements of the negroes, whose open doors give hasty sights of filthy and cluttered interiors, in which, if a bed is displayed, it is perhaps the only thing kept clean and orderly, as the family who are so proud and fortunate as to own so valuable a piece of furniture almost invariably have it for show, and sleep huddled on the floor. Even most of the mansions of the planters exhibit fast-increasing signs of poverty, neglect, and decay; and upon more than two-thirds of the estates the "great house" stands deserted and empty, sometimes falling into ruin, a melancholy monument of former luxury and life, when four-in-hands were frequent upon the roads, and there were sounds of revelry in the hospitable halls. Nature, so lavish with her own bounty, has enervated by climate the enterprise and energy of the dwellers amidst her warm luxuriance, while alterations in the social system have diminished the wealth and discouraged the exertions of the white population. Much of man's creation here is primitive, dilapidated, and dirty, but always picturesque, and marvelously suited to its special place in the landscape. Even where exposure, time, and decay have left their destroying marks, the tender grace of twining vines, starred with delicate blossoms, makes ruin romantic, till a piece of broken and tot-

tering wall, rough and stained, becomes, beneath its clustering parasites, an exquisite feature of the view for the gaze to dwell on with pleasure, and memory to recall as fair. But earth, air, and sea are full of animal and vegetable life; insects are plenty, but birds few, owing to the scarcity of trees, the only common denizens of the air being the black-*witch*, resembling our blackbird, occasional humming-birds, and, at certain seasons, quails in the canes; while dark, heavy pelicans float on the sea, or perch upon scattered rocks along the coasts. Small lizards abound, and centipedes sometimes

make their startling appearance. Flowers are gorgeous and various, from the large scarlet blossoms that burst from the leafless branches of a tall and peculiar tree, to the crimson and yellow "*pride of Barbadoes*," which grows wild upon the road-side amidst feathery, delicate leaves of countless acacias; thorny, unsightly cacti spread their serpent-like coils amidst fairer vegetation; and once in a while a small orange grove will add to the lavish richness of color the golden glow of its ripened fruit.

We located at Frederiksted, or "*West End*," in common parlance, the most quiet and secluded of the two towns of St. Croix, and by strangers generally preferred to Basin, on account of the greater number and attractiveness of its surrounding drives—a matter of some importance to invalids, whose physicians generally direct them to live in the open air, though, from the construction of tropical buildings, this purpose is almost as completely effected in-doors as outside. The town lies nestled in between the sea and the hills—from which Porto Rico, forty miles off, can be discerned when the atmosphere is clear—and at a short distance from shore presents a most picturesque appearance; but it is in reality little more than a negro village, upon whose thoroughfares whites are only occasionally seen. The streets are wide, and right-angled; the principal one, called "*Strangatte*," or Bay Street, fronts on the ocean, and contains about twenty-five buildings, the lower parts of which are used as

BAY STREET, FREDERIKSTED, ST. CROIX.

stores or counting-houses, and the upper as residences. American visitors will be delighted to see the stars and stripes floating from one of these, indicating the office of our vice-consul, whose kindly, unselfish nature, thoughtful consideration, and generous hospitality are constantly exercised in making more agreeable the stranger's sojourn in the strange land; while in one of these particular stores Alexander Hamilton served as a clerk before he emigrated to this country, to become a noted statesman and the antagonist of Burr. This street leads past the custom-house to the fort, at its end, where are mounted uncouth and ancient guns, one of which booms out every evening at eight o'clock, with a deafening explosion that seems to shake every habitation in the neighborhood. Here are the barracks, as also at Basin, where the Danish soldiers appear to be comfortably lodged, and where numbers die, stricken down by fever, too frequently occasioned by free indulgence of cheap rum, or want of prudent consideration of changed climate; for they are obliged to wear, even in this warm region, the heavy regulation uniform of woolen cloth. Among their other employments they cultivate and keep in order the "*fort garden*," where there is little pretense to horticultural display or botanical value, and where, on Sunday afternoons, the dark maidens promenade in white muslins, those from the rural districts, who are so fortunate as to possess any shoes, having carried them into town over the dusty roads.

APOTHECARY'S SHOP, FREDERIKSTED, ST. CROIX.

The Lutheran is the established religion, but there are, besides the churches belonging to this sect, others in the islands of the Episcopal, Roman Catholic, and Moravian denominations, the ministers of the latter being earnestly assiduous in their educational labors among the blacks, though there are several schools where the colored children, between the ages of six and ten, are obliged by law to attend, but where very few of them learn to read or write, as most of the instruction is conveyed orally. In the Episcopal churches there are still in use the ancient English prayer-books containing the services appointed in the thanksgiving for deliverance from the Gunpowder Plot and for the Restoration, as well as those used in lamentation over the death of Charles the Martyr. In the not very attractive churchyard, among the native graves, are those also of strangers who have reached the island too late to be saved by its renovating air.

There is a sufficient number of stores in West End in proportion to the population, the principal objection to most of them being the scantiness of the stock on hand. The frequent answer to a demand is the promise of the desired article at that uncertain time, "when the next ship comes in;" so that the inhabitants, not depending on so desultory a method for obtaining what they require, often send to St. Thomas for needed supplies. There is but one apothecary's shop allowed in the place, where are sold the most incongruous articles, including, besides the drugs, china, toys, tea, wine, stationery, confectionery, and other sundries alien to the proposed business. The market is, perhaps, the most

entertaining, amusing, and odorous place of resort in the towns. It comprises a square of about half the size of one of our ordinary street blocks, where every Saturday morning are collected from two to five hundred negroes, the seller seated beside her wares, which are displayed on cloths or trays spread on the bare ground, and where vendors and purchasers of all ages and shades jabber together with all their might in their almost unintelligible patois. The markets of St. Thomas and St. Croix are supplied with great quantities of excel-

lent fish, with pork, mutton, and fowls, few vegetables, and many varieties of fruit, among which are shattucks, sapodillas, alligator-pears, oranges, bananas, cocoa-nuts, mespels, limes, lemons, mangoes, tamarinds, and granadillas. Pine-apples are not cultivated in these islands, but are imported from Porto Rico.

About four years ago the largest conflagration ever known at St. Croix occurred at Basin, in which was destroyed the English church, school-house, and thirty-six private dwellings, forming altogether a loss of \$100,000—a sum which, in the present poverty of the country, it will be difficult to replace, and, with the great lack of means and want of energy, it will doubtless be long before the ruined edifices are rebuilt.

We found that the Christmas holidays were celebrated in both islands in a rather peculiar manner by the colored people, and for the entire previous year form their most cherished anticipation, as then for more than a week they are completely exempt from labor, and devote the days with unparalleled ardor to the pleasure of dancing. They commenced at two o'clock on Christmas morning, while the stars were in the sky, to parade the streets in gangs numbering from twenty to a hundred, males and females, preceded by a drum, which is sometimes accompanied by an accordion and triangle, to the sounds of which they march or dance along, singing in chorus a shrill and monotonous refrain. When they think they have thus sufficiently exhibited themselves to admiring spectators, they adjourn to some house which they have hired, or part of a

house which has been loaned for the purpose, and there trip the fantastic and generally bare toe with an untiring energy, only equaled by the surprising length of time they are able to continue the exercise. They frequently march and dance for days together with scarcely any cessation, and instances have been known of deaths from mere exhaustion and fatigue. Each party has a chosen queen, attired according to her own or collected means, who has always more or fewer maids of honor, in conformity to the importance of the crowd, one of whom incessantly rings a bell in front of her as they walk through the streets, while her train is held up by others, sometimes as many as six supporting her sable majesty's skirt. The royal robes are mostly of white muslin; but on New-Year's Day, of which they think even more than of Christmas, some of the town queens are gorgeous in silk and satin, and occasionally, by way of ostentatious ornament, will have sewed on the bosom of the dress bank-notes and gold doubloons, which are worn with very much the same pride as the insignias of an honored order

are displayed by its members. Many of their dances were brought by their ancestors from Africa, and transmitted through generations of descendants with scarcely any change in the figures and motions, and are always accompanied by the voice. Some are quite rude and primitive; others more intricate in their evolutions, and almost barbarous in effect, such as the "Bombala," having a curiously exciting influence on the performers; while one, the "Quelby," a sort of shawl dance, is graceful and even elegant.

They also commemorate Twelfth-night, or "Three Kings' Day," as they call it here, being the supposed anniversary of the visit of the Wise Men to the infant Christ—a holiday always observed in Catholic countries, and still retained here in spite of the establishment of the Lutheran sect. We had the unusual amusement of seeing the whole population of St. Thomas *en masque*, as the Danish governor, who understood the material he had to deal with, this year permitted the privilege of masquerading, wisely concluding that this gratification of vanity would prevent the riot and drunkenness of former oc-

FESTIVAL OF TWELFTH-NIGHT, OR "THREE KINGS' DAY."

STREET SCENE IN ST. CROIX.

casions; and, in truth, the people were so delighted at exhibiting themselves in party-colored garments and false faces that they were quite satisfied to rejoice in the carnival with comparative sobriety. There were but few attempts to maintain character, and the dresses were generally more distinguished by their bizarre combinations of colors than by significance; and we can never forget the striking effects produced by groups of these brilliantly tinted costumes beneath the glowing tropic sky, with the white West Indian houses for backgrounds.

To a stranger a noticeable feature of the population of St. Croix is the cooly element, or the occasional appearance of East Indian laborers, imported several years ago by those planters whose means enabled them thus to supply temporarily the deficiency of labor, which, since the emancipation, has been one cause of adversity on the island. So pressing became this evil that some owners of large estates had little choice between the prospect of great loss and the introduction of foreign labor. Some time before, an arrangement had been agreed upon between the United States and the Danish government, that any slaves captured in these seas by American vessels should land their cargoes on this island, where the Africans were to be employed for wages. The war occupying our ships elsewhere, this scheme was not carried out, but tended to render the importation of coolies a more familiar necessity.

The expense of bringing three hundred and ten of these people from India amounted to \$20,000, and by the contract one-third of them were to be women. They were to remain five years, and at the end of that time such as desired it were to have free passage home. They were to receive twenty cents a day and the privilege of the estate—that is, suitable lodgings, medical attendance, medicine, and a piece of provision ground thirty feet square, the same as the first class of negroes, without regard to their physical qualifications or superior or inferior capability for work—a clause which more than once has nearly occasioned serious trouble, as there is the same difference in their working value as between negroes, who only receive payment according to their class or labor. The men are mostly handsome and graceful, while the few women are exceedingly homely. They are shrewd and intelligent, acquire information easily, and some of them write beautifully in the characters and methods of their own country, and frequently communicate with and forward remittances to friends at home through the British consul at Basin. They are extremely fond of money, and save all they earn, trading among themselves and with the negroes, with whom, however, they will not mix socially, though they do not object to work with them; and, as they still maintain their differences of caste, some portions of their own community will not associate with others, even on the same estate. They have learned to speak English, or, at least, the patois used by the negroes, with exactly the same accent, but retain most of their own customs. They insisted on burning the body of the first man who died among them after they were brought to the island; but upon the occasion of another death they were informed that if they desired to perform the same rite they must provide their own lumber for the funeral pile; and as they never expend money when they can avoid it, they have since thrown the dead in the sea. Some of them were Nena Sahib's soldiers, and can show scars got before Lucknow, but are very sensitive about having served in that war, and averse to speaking about it to strangers. They still continue to keep the fasts and feasts of their own religion, and at stated periods fulfill a curious sacrificial ceremony, in which they build an altar, upon the top and at the foot of which they slay three goats, solemnly sprinkling altar and people afterward with the blood.

But even this limited effort to meet the demands for labor has been found very inefficient, owing to the expense attending the immigration, and the disinclination of the coolies to remain after their contracted time is out; and, consequently, the profits of sugar-growing and the number of inhabitants have very much diminished since 1848, when 25,000

blacks, by a concert of action, assembled in the two chief towns and declared themselves freemen; and after two or three days, during which considerable property was destroyed, but no lives taken, the claims of the insurrectionists were allowed. In 1853 the Danish government, which was suspected of having instigated the movement, compensated the planters for their loss of service at the rate of about \$50 for each slave. The government also established a system of labor laws, by which the rights, duties, and privileges of the negroes were accurately prescribed, and particularly defined the relations to be sustained toward each other by employers and employés.

Another feature in the jurisprudence of these islands is that of the reconciling court, where, before instituting proceedings at law, the opposing parties must appear and state their case; the judges of this court attempt reconciliation, and if not successful at the first application, appoint another meeting for the purpose, which failing, the parties are delivered over to the law. But little expense attends these proceedings, and nine-tenths of cases are thus settled. If a suit is commenced without this preliminary the plaintiff is nonsuited immediately, and the law court requires a certificate from the reconciling court that it has vainly endeavored to arrange the difficulty.

St. Thomas publishes semi-weekly, in Danish and English, one small newspaper, entitled the *Tidende*, principally devoted to shipping and commercial interests, with a few advertisements, very condensed foreign news, and full reports of the proceedings of the separate colonial councils in each island. St. John also forms one of this group in Danish possession, but is much more rarely the resort of visitors. English is the prevailing language in all these islands, though the white society is principally composed of Danes and their descendants.

After six months' sojourn in the Danish West Indies we summed up the advantages and disadvantages, attractions and annoyances, of a winter's residence there for strangers and invalids; to which we add, after some time has past, that the inconveniences and petty deprivations gradually fade from the memory, and leave there only things of beauty to be a joy forever. You feel while there that you have left behind you an advanced stage of civilization; you sigh in vain for books besides those you take with you, for evidences of the fine arts, for companions of culture; you miss gas and ice and many little accustomed comforts of the North; you may suffer some from heat, and you may tremble with anticipation of earthquakes, hurricanes, and tidal waves, though those interesting festivities of nature, having lately enjoyed a good spell of indulgence, are not likely, in the usual course of events there,

to be troublesome very soon again, and always leave the island more green after them, and the crops more productive. And you never know when you may be risking your social position and giving mortal offense by ignorantly or innocently running foul of the established feeling of caste between the white population and those who have any black blood in their veins, even when not indicated by appearance; so if you happen actually to think that all men are born free and equal, or if you are unable to distinguish the slightest kink in the hair or shade of the complexion, you peril your eminence in the aristocracy of color, where neither education, manners, wealth, nor character can overleap the prejudice.

But you live in a climate averaging 80°, where every breath is healing; beside a tinted and eye-delighting ocean, whose salt breezes are constant and strengthening; amidst lovely scenery full of vivid and varied hues; and beneath far, solemn, and deep blue skies, whose passing clouds flash down momentary sparkling showers, whose brief sunsets are glorious beyond the painting of words, and whose prismatic stars glitter like steel when not quenched by the most mellow and brightest of moonlights. You feel, while in the islands, as if you were buried from the world, and fret at the monotony of the days; but year by year, after you have come away, you will look back to those verdant hills, to those palm-bordered roads, to that purple and rosy sea, to those brilliant noons and beautiful nights, to the charming climate, with a yearning that is like a homesickness, and you will come to understand with the sympathy of experience the answer made us by an accomplished creole, whose acquirements fitted him for higher positions than he could fill in the islands, when we asked why he did not seek more accessible and worthy fortunes elsewhere: "Ah," he said, looking up to the heavens all aglow with morning light, "I can not live away from the tropic sun!"

THE SINGER AND THE SONG.

THE rapture of a song
Rose over crowded ways,
And thrilled the passive days,
And stirred the idle throng.

I sought the singer long,
And found—a grass-grown grave,
With naught to mark it, save
The memory of a song.

The happy flowerets, wed
To June, were blooming nigh;
Infinite heights of sky
Were glad above the dead.

Low in my heart I said,
"What need of lettered stone?
The singer died unknown,
And the song lives instead."

A VISIT TO A GREENLAND GLACIER.*

FRONT OF THE GLACIER.

Palaces of Nature.—The Glacier of Sermitsialik.—The Snow Line.—Glacial Movement.—A View of the Ice-Sea.—Crossing the Glacier.—Crevasses, and the Peril of passing them.—A narrow Escape.—The Voices of the Ice.—In an Ice Cavern.—A subglacial River.—Icebergs and their Formation.—An Iceberg is born.—A grand Spectacle and a dangerous Situation.—A Picnic on a Glacier.

IN a former article we briefly reviewed the causes which led to the downfall of the Northmen in Greenland. Principal among these was one which we will now more fully illustrate—the steady growth of ice.

Within sight of the very spot where those determined and hardy Northmen were erecting their hamlets, Nature herself was building edifices which, by absorbing the life-giving heat of the atmosphere, paved the way for the poverty and ultimate death of the people. These we may well call Nature's palaces, in imitation of the great poet who wrote thus of another region :

“Above me are the Alps,
The palaces of Nature, whose vast walls
Have pinnaced in clouds their snowy scalps,
And throned Eternity in icy halls
Of cold sublimity, where forms and falls.
The avalanche—the thunder-bolt of snow!
All that expands the spirit, yet appalls,
Gather around these summits, as to show
How Earth may pierce to Heaven, yet leave vain man
below.”

* *The Land of Desolation: Being a Personal Narrative of Observation and Adventure in Greenland.* By Dr. ISAAC I. HAYES. New York: Harper and Brothers.

The imposing character of the glaciers of the Alps is well known. Those of Greenland are even more grand. In observing them we witness phenomena not to be witnessed, at least not in an equal degree, in any other part of the known world. These phenomena exhibit results impressive beyond any thing upon the earth, not excepting even the earthquake and volcano.

After quitting the fiord of Igalliko, or “deserted homes,” as the name signifies (the deserted homes being those of the extinct Northmen), we proceeded in our steamer to the fiord of Sermitsialik, which means “the fiord of ice.”

This “fiord of ice” is of almost equal length with “the fiord of deserted homes,” and the two run nearly parallel. They are separated by a mountain ridge. This same ridge sweeps south, and encircles “the fiord of deserted homes” like a horseshoe. It has in that quarter no break, and is, therefore, a barrier. To the north there is a break, through which comes the glacier of Sermitsialik, down into the fiord of Sermitsialik; hence the name “fiord of ice.”

The Danes call such a glacier an *ice-stream*, which very accurately describes its character. for it is a stream of ice from a great reservoir which covers the interior of Greenland. This reservoir the French call a *mer de glace*; the Danes, the *eis-blinken*. It is composed of

THE GLACIER OF SERMITSIALIK.

snow hardened to ice, and is in many places hundreds, nay, thousands of feet in depth. The glacier, or ice-stream, of Sermitsialik is but one of many hundreds which project into the sea from the Greenland *mer de glace*, or *cis-blinken*.

It is hardly necessary to say that while the ice has been accumulating in Greenland the climate has steadily grown colder, as the Northmen found to their cost. Still there are habitable spots here and there along the coast, though none in the interior, so far, at least, as known, for there the covering of ice appears to be universal. Therefore, since the country is owned by the King of Denmark, that monarch may safely be said to be the ice king of the world. Few persons un-

derstand fully the escape we made when we failed to purchase from Denmark the earthquake island of St. Thomas; for had that purchase been ratified by the obstinate Senate, it was in contemplation to buy up the Greenland glaciers from the same country, and the Iceland yokuls to boot; and there can be little doubt that the Danish king would gladly have sold the whole lot of them, inasmuch as a king who does not appreciate an earthquake can hardly be expected to bestow his confidence on glaciers.

Glaciers are formed on most of the lofty mountains of the world, as is well known; but the altitude at which they are formed varies, of course, with the degree of latitude. The summits of Chimborazo and Popocate-

petl, under the equator, are clothed with snow and ice perpetually; but we do not find this until we have ascended almost 15,000 feet above the sea level. Below the "snow line," as it is called, vegetation, commencing with an arctic type, passes steadily to that of the tropics. But far down into this region of vegetation comes the glacier, or ice-stream, from the great *mer de glace*, or ice-sea, the end of it steadily melting off in a lower, and therefore warmer region.

Following the "snow line" across various mountain chains northward, we find an almost uniform depression. In the Alps it is, of course, much lower than on Chimbo-

MAP OF THE GLACIER.

from the end of them. These pieces are called *icebergs*.

The flow of a glacier may be likened to the great flood which sweeps down the valley from a broken dam. It comes more slowly than the water, but it comes no less surely, and its movements are in obedience to the same laws.

With these general observations the reader will be the better prepared to understand a description of the glacier of Sermitsialik. When it first burst upon our view, as we steamed up the fiord, it was certainly one of the most mag-

THE SNOW LINE.

razo. In South Greenland, where I have observed it in latitude 61°, it has come down from 15,000 feet at the equator to 2400. I have observed it also at latitude 69°, where it is 1700 feet; at latitude 78°, where it is 500; and between 80° and 82°, where the snow line appears to touch the sea, leaving beneath it no belt for vegetation whatever.

The glaciers of Greenland differ only from those of other mountainous countries in reaching the sea before melting. They push their way far out into the water; and instead of discharging, as other glaciers do, by melting, pieces break

nificant sights that ever met human eye. When still miles away we saw before us a white wall stretching from shore to shore. Beyond this a vast inclined plane climbed up until it was lost in a distant line of blue.

VERTICAL SECTION OF GLACIER.

The fiord is two miles wide. The valley beyond, in which lies the glacier, is of corresponding width, and the glacier fills it perfectly. How thick it is can not, of course, be told, but it must be every where hundreds of feet; it is probably from one to two thousand near the centre. The banks of the

CROSSING THE CREVASSE ON AN ICE BRIDGE.

fiord, continued, were the banks of the glacier for about ten miles, when they vanished to a wedge-like point, and melted then into the great *mer de glace*, which, expanding to right and left, carried the eye away upon its boundless surface as upon an illimitable ocean.

At length, as we approached nearer, the inclined plane was lost to view, and we were close to a great, glittering wall of the purest crystal, from one to two hundred feet high, and ablaze with all the hues of heaven.

A cold chill crept over me as I stood on deck while we steamed along in front of this vast reservoir of frost. The sound of falling waters filled the air; and ever and anon deep reports, which seemed to be caused by con-

vulsions of the earth, were emitted from the great body of ice. The falling waters were the melted snow and ice of the surface of the glacier, which, gathering into streams of considerable size, at length leaped over the icy wall, sending a cloud of spray floating off upon the air, to dissolve the sun's rays, and send back to the eye a fluttering fragment of a rainbow. The sounds were occasioned by the movement of the glacier in its bed, in consequence of which clefts or crevasses are from time to time opening.

I probably enjoyed an opportunity such as never before fell to the lot of an observer, for no Greenland glacier is so accessible as that of Sermitsialik, and this had not been visited

THE KRYOLITE MINE AT IVIKTUT, ARSUT FIOR.—[SEE PAGE 214.]

before by any one with either scientific or artistic intent. The Greenland fiords are for the most part interrupted either with islands or shoals, which, by preventing the free discharge of the icebergs to the ocean, render the navigation of the waters impossible even to a boat. Such is the character of the fiord of Jacobshaven, in Disco Bay, North Greenland, which I have made the most strenuous efforts to ascend, and which is crowded with a perfect wilderness of icebergs for the space of nearly thirty miles, being in places so tightly packed together as to be scarcely distinguishable even from the glacier itself when viewed from the neighboring hill-tops. But the fiord of Sermitsialik presents no such embarrassing feature. The water steadily deepens from the glacier front (where in one spot it is 270 fathoms) toward the open sea, and the current being rapid, owing to causes which I shall presently have occasion to explain, the icebergs float away as fast as formed. While coming up the fiord we passed several of large and many of small size; but none of them were aground, and all were moving off as if in haste to mingle their crystals with the rolling waves, and once more enjoy the freedom of the boundless sea.

I have spoken of the front of the glacier near which we passed as a wall and as a coast-line. As a coast-line it is winding; as a wall it is vertical, but far from smooth; on the contrary, it presents the most fantas-

tic collection of forms that can possibly be conceived of—caverns that are apparently limitless, peaks like church spires in form, Gothic arches without number, clefts that penetrate in zigzags through the body of the ice until they are lost in depths of blue; and in this blue we see the most perfect of all transparent hues, changing, too, with every moment, and subtle as the colors of the opal. Talk of painting it! The “light of a dark eye in woman” would scarcely be a more difficult task for the artist’s hand. The green of the caves is not less subtle nor less beautiful, and is seen wherever the ice overhangs the water. In the direct sunlight, after the surface has been for some time exposed, the appearance is that of white satin. A recent fracture, however, always discloses blue to the heavens and green to the sea.

When we had crossed the fiord the water was discovered to be muddy, a circumstance which I was at a loss to understand until it was seen that a strong current was pouring out from underneath the ice. The fiord is much deeper on that side than on the side by which we approached, and, of course, the valley in which the glacier rests has a corresponding formation. Into that deepest part of the valley the surface drainings of the *mer de glace* ultimately find their way through the crevasses, the various streams uniting form a subglacial river, which, rushing beneath the ice, reaches finally the front of the glacier, where it bubbles up to the

surface like the waters of a huge seething caldron—a Stygian pool of fearful aspect.

The front of the glacier presents almost a right angle at its centre, thus showing the centre to move much more rapidly than the sides.

Arriving at our destination on the south side of the fiord, and discovering a shelf there with good holding ground at nineteen fathoms, we let go an anchor at about one hundred fathoms from the glacier, which seemed at that short distance to be hanging almost over us. To one at all familiar with the tricks of glaciers it was clear from the first that the situation was one of danger. But the captain (our steamer was only chartered, captain and all hands included, for a three months' cruise), who was solely responsible for the vessel, seemed to like his anchorage, and, trusting to good luck and not management, declared that if we were going to stay at the glacier at all, there's where we must continue, for no other anchorage could be had, so far as he could discover. So there was no alternative but to take the risks, whatever they might be, and hold on there until the morning at least.

We went ashore after supper, and, climbing over the rugged rocks, we reached a hill-top, twelve hundred feet above the sea, and saw the sun go behind the mountains (one can hardly say "set" where the night is never dark in July), and against the brightness of the sky in the lingering twilight we saw the great ice-sea of Greenland illuminated with the gorgeous tints of the clouds, as if it were a mirror to catch their splendor in. Oh, what a sight it was, that desert-level waste of ice, its cold, hard surface glittering with a borrowed glory, and taking to itself the robes of heaven, as if to cheat one's memory of the right to hold it as the very type and substance of what might ever bear the name of desolate!

The night did not prove promising for the safety of the steamship *Panther*, upon whose life (if one may think of a steamship having life, as certainly it seems to have) our lives were all dependent; for at irregular intervals alarming sounds proceeded from the great ice-stream before us, and a sharp, quick crash, followed by a heavy thud, would now and then give warning that a mass had split from it and fallen to the sea. When the morning came the sea was covered with small fragments, which had been, as it were, thrown off in very spitefulness; and many of them, carried by the current of waters poured out from underneath the glacier, came grinding along the *Panther's* sides, swiftly rushing down the fiord toward the ocean.

By this time the captain had become well convinced that some other place might be safer for his vessel; and accordingly we went together early in the morning across the fiord

to make discoveries. Owing to the loose ice which in the night had been broken from the glacier, the passage across the fiord in our little boat was not made without difficulty. In many places the boat could not be propelled with oars, and we were obliged to push along by main force, using the boat-hooks and oars as poles. The scene had greatly changed from the day before, since, besides the ice strewn upon the sea by the breaking off of fragments during the night, the sky was leaden, and there was a perfect absence of color every where. The ice was a dull, cold gray, the atmosphere was chilly, and, although our labors were by no means light, overcoats were not uncomfortably warm.

The sun had slowly risen above the hills when we finally reached the north shore, where we were fortunate enough to find good anchoring ground, with plenty of room to swing, in a bay where there was no current to speak of, and very little ice. There being only five fathoms water, there was no chance of any large pieces of ice coming down upon us there; and accordingly it was decided to shift our ground to that place.

But since we had come so far, we concluded that we would go a little farther; so we landed, to find ourselves upon a green slope, with the side of the glacier to our right, a tall cliff to our left (about half a mile away), and a gorge in front. Crossing the green slope, we reached the gorge, and clambered through it over huge blocks of ice and great piles of stone for about a mile. Discovering a place there where we could reach the glacier, we came suddenly to the resolution to cross it, and return to the vessel from the opposite shore. We accordingly sent our boat's crew back with directions to return to the ship and await our arrival. They looked incredulous, but, like true sailors, they obeyed orders, and the captain and I set out upon a hazardous adventure.

The side of the glacier where we made the ascent sloped at an angle of thirty degrees. There was much foreign matter—stones, rocks, and sand—on the ice, which deprived it entirely of a slippery character. A dreary scene met us when we had reached the summit. Imagine the rapids and river above Niagara congealed to the very bottom, and we in the centre of the frozen stream; imagine Lake Erie equally solid, and the fall itself a wall of ice, and no bad idea will be obtained, on a small scale, of our surroundings. Lake Erie represents in miniature the great *mer de glace*, the rapids and the river the glacier pouring from it, and the frozen fall itself the glacier front. The horseshoe, however, would be reversed. Below the fall the unfrozen fiord is represented by the river winding to Ontario.

The river-like character of the ice-stream was very marked. On every side there were

the same indications of movement as in running water, only with this difference, that while the river from bank to bank is straight upon the surface, that of the glacier is curved on either side, forming two gorges.

The glacier at the point where we proposed to cross over was of somewhat greater width than its front, where it projects into the fiord—about two miles and a half, as subsequent observations proved. To cross it was found, upon trial, to be no easy matter, for it was broken by clefts, into which there was constant danger of falling, as we were compelled to spring over them. These clefts, or crevasses, were generally parallel, running inward and upward from the shore at an angle of about 40°. In places they were very near together, only a few yards separating them; in other places they were twenty or thirty yards apart. Sometimes they ran into and crossed each other, although preserving a general sameness of direction—a circumstance which gave to our journey its dangerous character; for as we followed the ridges between the crevasses we were often brought up where two united, and were compelled to spring an unfathomable abyss, or to retrace our steps and seek a better track. Sometimes we did the one, sometimes the other. Luckily we were both sure of foot.

We reached the middle of the stream, however, without any very serious difficulty. Here there was a dead level for about two miles, and the ice was very little disturbed. There were, in fact, no crevasses at all, but, on the contrary, a number of rivulets gurgling along over their crystal beds, sparkling in the bright morning sunshine, and meandering between their banks in search of the nearest cleft where to plunge down and find their way to the rocky bed of the glacier. Looking up the glacier over this level stretch, it presented a most distorted aspect where the ice had poured over a precipice, forming, as it had steadily come down, a series of ragged escalades, which might be likened to the steps of some giant temple. Indeed, it was a stairway befitting the grand palaces of nature which lie away upon the mountain-tops beyond.

This was not my first experience in an ice wilderness, but I never witness such a scene without emotion. There is something in it which impresses the mind with awe; something almost terrible in the boundless desolation. God seems nearer in these deserts.

Alarming sounds occasionally issued from the great thickness of ice beneath us, as if the monster glacier rested uneasily in its bed. These sounds were often very loud. They were occasioned by strain upon the ice as the glacier slowly moved along, as has been already mentioned, opening wider in one place a crevasse already formed, closing another, or, perhaps, creating a new one.

I should not, indeed, have been surprised, although I should doubtless have been much alarmed, had a yawning chasm opened beside me or beneath my very feet.

Crossing the middle portion of the glacier with care, we approached the shore, and began to descend as we had before ascended. And now the troubles and dangers which we had before experienced with the crevasses were greatly multiplied. It became often a serious question whether we should be able to proceed at all; whether we should not be forced to retreat. The ice had been much more disturbed than on the opposite side, and the crevasses were often of such great width that we could not spring over them; and after wandering to and fro, jumping here and there as best we could, sliding about and risking our necks continually, we were several times forced to take the backward track, and do over again what we had before done with so much labor.

At length our case became desperate. After much effort we found ourselves out upon a very acute angle, with a deep crevasse on either side, the two having crossed each other; but from one side a large fragment had split off, and, as one sometimes sees in mountain gorges where a falling rock has wedged itself in between the walls, so this fragment had become jammed, forming a natural bridge, the top of which was sharp, like the roof of a house, and as slippery as the house roof would be if covered with sleet. Yet to take this bridge or turn back were the only alternatives. A very decided disinclination to repeat our numerous former hazardous leaps, coupled with a feeling of pride, won the day for the bridge; so we tossed hats for the first venture, and the lot fell to me. Getting upon all fours, I slid down a steep slope as best I could, and came to the sharp crest of the bridge, which I straddled, and then propelled myself along by a series of jumps. When at the middle I looked down on either side into a yawning depth of blue. I heard the roar of waters rushing beneath me, but I could see nothing except the "darkness most profound" in which the chasm terminated. It fairly made my head giddy, and I am free to confess that I would gladly enough have been back whence I had started. But to retreat I could not, even if so disposed, as it was not possible to turn round, and I could not go backward. There was nothing, therefore, to do but push ahead, and this I did, cheered on by the captain, who insisted that I should be sure not to break the bridge down, as he wanted the use of it. Thus encouraged, I continued to bound along; and, without any worse results than a rather more than usually animated state of the heart, I found myself on the opposite bank. The captain followed in the same manner, but neither of us desired to repeat the experiment. The next crack we sprang required a leap of eight feet. The sides

weresloping and slippery, and, in consequence of slightly missing my footing in the leap, I did not land fairly on my legs. As I felt myself going back and sliding into the cleft, I experienced that horrid, sickening sensation which comes over one only at the near prospect of death, when one is without the chance for a struggle. The captain's hand, put out in season, probably saved me from going down headlong. Soon afterward we reached dry land, thankful that our adventure was well over.

We were now about two miles from the vessel, which was traversed through a gorge corresponding to that by which we had ascended on the opposite side, only that it was much rougher. The pressure of the ice against the land, as the ice had moved and expanded, presented some wonderful exhibitions of power in forcing up rocks and earth to the height of forty and fifty feet. Some of the rocks, weighing hundreds of tons, were treated as if they were the merest pebbles tossed up and scattered by the mould-board of a plow.

Down near the fiord the disturbance of the ice had been very great, in consequence of the rapid descent of the land. Immense cracks had opened here from the bottom. One of these seemed like the entrance to some vast cavern. Inspired by curiosity (I know no other possible motive to tempt one into the commission of such folly), I entered this, to find myself scrambling along over rocks and through deep mud (water falling all the while upon me in torrents from the icy roof above my head) for a distance of about thirty yards, when I stood upon the border of a dirty river that rushed, roaring and hissing, past me. I have already mentioned that such a stream pours out from underneath the front of the glacier into the fiord, and this was it.

Of all the sounds and signs of tumult made by water that I have ever witnessed this excelled. The roar of the fast-flowing stream dashing over the steep declivity between the rocks beneath and the ice above, breaking in its course around great boulders, upon which the glacier was supported, was perfectly deafening. I had entered beside a ledge of rock about ten feet high, upon which the ice rested firmly. Supporting myself against this, I witnessed the unusual spectacle with safety, though not with comfort; for to be drenched with ice-water is, to say the least, not pleasant.

As I stood there I realized more fully than ever before the process by which have been formed those markings upon the rocks, that Professor Agassiz has made us so familiar with, in various places which were once covered with ice during the glacial epoch. The immense pressure upon the rocks and boulders ground some of them to powder, rounded others, and made deep and lasting scars,

which some future explorer may one day witness if the glacier of Sermitsialik should disappear as the glaciers have from the White Mountains.

Below me the ice was worn away in such a manner that I could go down stream about fifty feet, near to a point where light was admitted through a cleft; and a stream of water also, which, falling from the surface of the glacier, mingled its purity with the muddy gatherings of the bottom.

One does not remain in an ice cavern drenched with ice-water very long from choice; so, when curiosity had found reasonable satisfaction, I retraced my steps, feeling now that the whole glacier was very likely to tumble about my ears; and joining the captain, who was waiting for me on the shore, we were soon with our shipmates aboard, and excited their envy with the recital of our hastily conceived morning adventure.

Except the observations above noted, I was not able, owing to the shortness of our stay in the neighborhood, to make any examination of the rate of progress of the glacier. Peter Motzfeldt, our pilot, gave me, however, some valuable information, which, although not scientifically accurate, is yet approximately true. Motzfeldt is a Dane, and when he first came to the country, fifty years ago, he walked across the valley which the glacier now completely fills, and plucked huckleberries upon the identical spot where I had gone into the ice cavern. The front of the glacier then presented the aspect of a great ice wall crossing the valley some distance up from the sea, and he pointed out the position which it then occupied, so far as his memory served him. Assuming his memory to be reasonably correct, the movement of the glacier from that time to this has been about *seven inches* daily, the distance being about two miles.

The vertical section (see page 206) run in the axis of the glacier from its extreme point at the sea to where it joins the *mer de glace*, a distance of two miles, is, of course, partly conjectural, as I could not, except by inference, know the topography of the ground upon which the ice rests; but the surface I could measure, and the bottom must in a great degree conform to it. By referring to the map of the glacier on page 206, the general features of the glacier will be sufficiently apparent.

During the absence of the captain and myself, the artists had not been idle. They had landed near the glacier, and with brush and camera had begun their work. The day was warm, the mercury rising to 68° in the shade, and the sun, coming around to the south, blazed upon the cold wall of ice. This must have produced some difference of temperature between the ice touched by the warm rays and that of the interior, which

was in all probability several degrees below the freezing-point, for toward noon there was an incessant crackling along almost the entire front. Small pieces were continually splitting off with explosive violence, and, falling to the sea, produced a fine effect as the spray spouted up from the spot where they struck. Scarcely a minute passed without a disturbance of this kind. It was like a fusillade of artillery. Now and then a mass of considerable size would break loose, producing the impression upon the minds of the most courageous that our situation was one of great danger.

By one o'clock every body had come aboard for dinner; and for a while we all stood on deck watching the spectacle, and noting the changes that took place with intense eagerness. It was uniformly observed, among other curious phenomena, that when the ice broke off the fractured surface was a deep blue, and that if any ice, as sometimes happened, came up from beneath the water, it bore the same hue, but after a short exposure to the sun the surface changed, becoming an almost pure white with a satin lustre.

Our situation for observation could not have been better chosen, and it is not likely that such an opportunity was ever enjoyed before—since it is not likely that a vessel ever rode to her anchor within a cable's length of a glacier.

After dinner the work was to have been resumed. The photographers hastened ashore, hoping to catch an instantaneous view of some of the falling fragments. Preparations were making for weighing anchor, steam was already up, and we were about to move over to the north side of the fiord, when louder and more startling reports than any we had before heard pealed forth one after another in quick succession. A number of large pieces had broken off, the falling of which disturbed the sea to such an extent that the vessel rolled perceptibly, and waves broke with considerable force upon the shore. Then, without any warning, there came a report louder than all combined. It was evident that some extraordinary event was about to happen, and a feeling of alarm spread through the ship. The boat had landed the photograph party on the rocks within thirty yards of the glacier, and had shoved off. The captain shouted to the coxswain to "hurry up," and had given the order to "up anchor;" but it was too late.

The glacier was in a violent state of commotion; it seemed to be literally going to pieces. Its extreme point, at the centre, was undergoing disintegration. The form of the glacier was there particularly picturesque, and we had never ceased to admire it, sketch it, and photograph it. It exhibited a perfect forest of Gothic spires, which,

originally ragged, had, by the action of the weather, been converted to something like regular shape, until it bore the appearance of a vast edifice constructed by the hands of man. At the base of these spires there were numerous arches, more or less perfect, which still further strengthened the illusion that it might be of human and not of natural formation.

At the very extreme point there was one spire that stood out alone, towering above the others. It could not have been much less than two hundred feet high. The loud report to which I have referred came from this spire, which was going to pieces. It did not topple over, but went down as if the foundations of the earth were giving way, and the spire was disappearing into the depths below. The effect was magnificent beyond description. It did not sink instantaneously, but lasted for at least a quarter of a minute. The crumbling spire was quickly enveloped in a great cloud of spray, in the midst of which the summit vanished, and was seen no more.

Meanwhile other portions of the glacier were undergoing a similar transformation, influenced, no doubt, by the shock which had been communicated by this first disruption. Other spires, less perfect in their form, went down in the same manner, and great scales, from all parts of the front where there were no spires, split off, and fell with a prolonged crash and hiss.

Out from the midst of this din, and at length drowning it completely, came a peal compared to which the loudest thunders of the heavens would be but a feeble sound. The whole glacier was enveloped in a cloud, which streamed up and along the icy wall, as one sees the mists rising from the abyss below Niagara, and, receiving the rays of the sun, held a rainbow hovering over this vortex. Out of this cloud rose a great white mass—at first slowly, then with a bound—and from out the foam and mist a wave of vast proportions rolled away in a widening semicircle.

Until this moment I had watched every action of the glacier with close attention, but now the impulse of curiosity was divided with that of safety. The wave came down upon us with the speed of the wind, and the instinct of self-preservation drove me to seize the first firm object I could lay my hands upon, and grasp it with all my strength. The wave occasioned by an earthquake only can compare with it in magnitude and force. It rolled beneath our ship, lifted her upon its crest, tore her from her anchorage, and hurled her, as if she had been the veriest toy, toward the rocks. I had not a doubt, so far as there was time to think at all, that she would be stove to pieces or landed high and dry.

But there was little time for reflection.

While the vessel was almost on her beam ends, and we were all clinging to something or other for safety, a deluge of water fell thundering upon the deck, and the ship was half buried.

We escaped, seemingly by a miracle. The anchor had brought us up within two fathoms of the abrupt shore, against which the huge wave broke, and rolled back upon us with a blow that caused some injury, but did not seriously hurt any body.

Through the mercy of Providence we had been saved; but where were our comrades who had just landed on the shore, and those in the boat? This was our first thought. The boat proved to be all right. She had got head on to the wave, and far enough from the rocks to ride easily; but the people on shore could not escape the whole fury of the waters. Seeing the wave, they had clambered up the hill-side as far as they could; but finding they would be caught, they flung themselves flat upon the ground, and, clinging to each other and to the rocks, they prevented themselves from being carried off or seriously hurt. One had been, however, lifted and hurled with much violence against a rock; but, with the exception of a few bruises, he was not injured, and with great fervor he thanked Heaven that it was no worse. He had, indeed, abundant cause. Had the party not been favored by the rocks—which were of such formation that they could readily spring from ledge to ledge—they must inevitably have all perished. The wave, before it reached them, had expended much of its force. Had they been upon the beach and received the full force of the blow, they must have been struck to death. Their implements—bottles, baths, plates, every thing which they had purposed using in their art, except their camera, which had been, fortunately, perched upon a hill and left there in the morning—were either carried bodily away or made a wreck of.

Waves of considerable though not dangerous magnitude followed, and it was quite half an hour before the waters were at rest. And there before us, floating in the sea, above which its crest rose a hundred and forty feet, was a glittering mass of blue—a *lapis lazuli*, a quarter of a mile in diameter, set in chased silver—for the sea was but a mass of foam. And this was the monster that had made the mischief. An iceberg had been born.

Thus had we not only seen an iceberg born, but had felt its terrible power when set in motion from the parent glacier, to tread the blue waters of the deep, and through many years to come to cast into the sea, little by little, the crystal drops of hardened snow which have for ages lain upon the Greenland hills.

Upon measuring this iceberg afterward, I

found its crest to be 140 feet above the water; and since fresh ice, floating freely in the sea, has seven parts of its total depth beneath the water, its total depth must have been upward of 1100 feet.

As may well be supposed, we did not wait for another iceberg to catch us in such a defenseless situation. Our jolly captain was now quite well content to own that he held glaciers in profound respect, and, making all haste to get the anchor up, we steamed to the other side of the fiord, and, in the snug bight we had discovered in the morning, found safety from any such further freaks of our magnificent neighbor.

On the day following we resolved to scale the glacier in a body. A picnic on a glacier was a novel experience which but few wished to forego, and so we set about getting our traps together; and employing some native men and women, who had followed us up the fiord in their skin boats, to carry our luggage, comprising surveying instruments, photographic implements, artists' materials, provisions, etc., we set out at an early hour, in order to avoid the great swarms of mosquitoes and flies infesting the marshy regions of the green slope leading up to the gorge which we must traverse in order to reach a spot where the glacier could be scaled.

Our party—a motley one indeed—sailors and passengers, native women in short seal-skin pantaloons, and native men in long pantaloons of the same material—formed a long trail across the plain, and wound through the gorge to a mile beyond where the captain and I had gone up the day before. Here there were fewer crevasses, as we had come upon the broad plane before mentioned. The foreign material, especially near the side, was immense. Rocks weighing many tons were imbedded in the ice, or were lying loose upon the surface, owing, probably, to the ice having melted away. There was also much sand. Thus had I practical observation to account for the distribution of rock and sand by icebergs; for this foreign matter being carried to the sea with the glacier as it moves on, ultimately becomes part of an iceberg, which, drifting away and melting, finally lets it drop. The great Banks of Newfoundland receive constant accessions in this way. It was in like manner that those great boulders which we find upon plains like our Western prairies were deposited at a time when they were the bed of the ocean, and icebergs drifted that way from the arctics.

Our object was to reach as near as possible to the middle of the glacier, and then camp; and having a much better track than the captain and I had found, the effort was successful. Not only this, but a considerable distance, in addition, was made by some members of the party up the axis of

the glacier. Only in one place were we brought up with any thing like the fearful chasms which we had sprung over on the previous journey. The captain, however, proved himself, as before, a good leaper, and being both fearless and full of spirit, he ordinarily led the way, carrying the end of a rope for the greater security of his followers, as well as the better to get our traps over. Thus was every body and every thing carried in safety, and only once did an accident seriously threaten. This occurred to a man who had got something in him to make his legs unsteady, and but for the captain's rope he would certainly have disappeared into the bowels of the glacier. He was hauled up in a lively state of wonder as to "how we all got down there." Our fair companions in the seal-skin pantaloons required very little assistance, and in their soft leather boots were more sure-footed than we. They seemed quite surprised at our generous offers of assistance, for they had been in the habit not only of helping themselves, but their lords as well, in every thing where help was possible—a practice universal among savage and half-civilized people. Gallantry is a fine art, the sentiment not being at all natural to man.

What I have already written respecting the glacier makes it quite unnecessary to detain the reader with any further description of it. We made our surveys, endeavored to fathom some of the crevasses, ascertained accurately their general direction, photographed to right and left, sketched abundantly, and had altogether as gay and festive a time of it as before at Krakortok. We had a capital dinner (prepared, happily, without the aid of our ship's cook and steward), and we did not lack the dance, without which a picnic would be a delusion and a snare. The sun shone brightly on us, and even there in the great ice wilderness we were not cold. There was singing as well as dancing, and there was, besides, the music of a "babbling brook," which flowed near by, and not far off dashed down through a cloud of spray into a fathomless abyss.

The day was one long to be remembered—less, however, for its incident than for its novelty. We had some laborious tramping and climbing, and returned fatigued. But as virtue meets its own reward, so we were satisfied.

"With what?" asked one who could not be persuaded to accompany us.

"We can say that we have been upon a Greenland glacier, and had a picnic there besides."

"You might have *said* that any way, and saved yourselves sore feet," was the laconic answer.

But we had not chosen to be governed by such immoral precepts; and yet I fear the ability to *say* they had been there inspired

more than one to undergo the danger and hard labor of the day.

Soon after our return we weighed anchor, and steamed away beyond the arctic circle to find the midnight sun.

On our way we entered the great fiord of Arsut, and passing through the cold shadow of the lofty Kunak Mountain, halted at the famous kryolite mine, the only spot in the world where that mineral is found. The mineral is nearly pure soda, and but for its remote and almost inaccessible situation, would be of inestimable value, since the soda of commerce, otherwise than from this mine, is wholly of artificial manufacture. From ten thousand to twelve thousand tons of it are, however, mined, or rather quarried, annually, one half of which goes to Denmark, the other half to Philadelphia, where the Pennsylvania Salt Company make use of it for all the purposes to which artificial soda is applied. And besides that, the refuse matter, embracing silica, carbonate of lime, and traces of numerous minerals, the principal among which are tin, iron, lead, and copper, is employed in the manufacture of a species of table-ware resembling china, though being fused and moulded like glass, the expense of manufacture is much less.

The scenery in the neighborhood of this kryolite mine, especially west of the mining village of Iviktut, is magnificent, but, owing to the cloudy and falling weather, we had but little opportunity of enjoying it; but we secured on our way some good photographs of Kunak Mountain, one of the loftiest and most picturesque on the coast.

To the American agent, Captain Reynolds, and to the courteous officers of the company stationed at Iviktut, we were indebted for an opportunity to make a full inspection of the works, where about one hundred miners are employed.

THE MYSTERIOUS CASE OF MY FRIEND BROWNE.

HOW bitterly cold it was in New York on the evening of the 4th of February, 1871! I was sitting in front of a snug coal fire in my cozy little library in Washington Square. I am somewhat inclined to be what is called a bookworm: I love with my whole heart whatever is old, quaint, and musty in the way of books. They are fascinating to me in proportion as they are ancient, and possessed of that peculiar smell characteristic of antiquated bindings and worm-eaten paper. What other merits they may possess is a matter of indifference to me. To be acceptable they must be old.

On this especial evening my happiness was complete. During the day I had determined to brave the winter wind in search of some new antiquity of literature—something that should be exceptionally ragged,

obscure, and aromatic. Accordingly I betook myself to my favorite resort in such emergencies—the old second-hand bookstore in Ann Street, and, after ransacking about for a while, I hit upon what seemed to be a number of old, decayed letters bound up together, and protected by a time-worn leather cover.

Here was a prize indeed! With trembling eagerness I inquired the price, and felt offended almost at being told it was ten cents! Willingly would I have given a hundred times as much, had it been asked. But I reflected that swine were always prone to trample upon pearls, and paid my ten cents in silence. Then, placing my purchase carefully in my innermost breast pocket, I hurried homeward through the biting wind.

Supper over, I ensconced myself in my big easy-chair, and prepared for a campaign into the realms of antiquity. My centre, as already hinted, was protected by a glowing fire, my right flank defended by my last half bottle of rare old port-wine, my left wing strengthened by a time-honored pipe of fragrant Latakia, and my rear brought up by a judicious arrangement of cushions and springs. Every thing being ready, I drew forth my precious budget, and the campaign began.

After a little general skirmishing and reconnoitring, in which long practice and experience had rendered me an adept, I began to gain an insight into what had at first glance appeared somewhat involved. The papers (consisting of copies of letters and extracts from a journal) contained a story of three individuals—two men and a woman—who lived about a hundred and fifty years ago. One peculiar circumstance was noticeable which considerably added to the obscurity of this tale—all the proper names had been omitted. A blank space was left for each one. Even the person (a friend, apparently, of the chief actor in the drama) who had copied and arranged the original letters and papers was as nameless as the rest. But by dint of inserting initials in these blank spaces, and noting down here an event and there a date, I gradually arrived at a comprehension of the main points of the story, which (for I shall resist the temptation to transcribe it in the original words) ran somewhat as follows:

Early in the last century a man, M——, was residing in the vicinity of what was then the flourishing town of New York. He was an enterprising and successful young farmer, who, barring the fact that he was an orphan and unmarried, wanted nothing to complete his felicity. It seems probable that the very fact of his having so little to desire put it into his head that he needed a wife—some one to take charge of his household affairs, receive him with a kiss and smile on his return from the day's work, and

bear him children who should transmit his name to posterity. Such a one he believed himself to have found in the person of Miss H——, a young lady belonging to one of the best families in the neighborhood. The parents, well-to-do people, readily gave their consent to the young farmer's suit; she herself seemed to favor him and reciprocate his affection, and every thing seemed to prophesy a speedy and happy marriage.

At this point B—— made his appearance on the scene. He was at this time a lawyer of fair standing and repute—young, good-looking, and, for those days, well versed in the arts and usages of polite society. Retained as counsel by the H—— family in a lawsuit, on its termination in their favor he gradually advanced from the position of legal adviser to that of a trusty and intimate friend; and in the heart of one at least in the family he seems to have stood higher still.

One morning M—— came down to New York, went to the jeweler's, and bought a handsome gold ring, which he purposed presenting to his mistress as a pledge of their approaching union. But that union was destined never to take place. On reaching her house he found every thing in wild confusion: the young lady had eloped the night previous with the traitor B——, and no one knew whither. M—— returned to his farm, moody and sullen, and from that hour was an altered man. The ring which the falsehood of Miss H—— had defrauded of its original purpose he wore always thereafter around his neck and next his heart; and surely, if there be poison in the evil passions and unhallowed emotions of the human soul, we can almost believe them to have hardened into the gold and crystallized into the gems of that engagement-ring!

Meanwhile B—— and his wife found little difficulty in obtaining the forgiveness and favor of the H—— family; and at the decease of the old people they inherited half the estate, the remainder going to an only son, at that time absent in Europe. M——, however, kept entirely aloof from them until the time of his death; but shortly before that event he sent to B—— a letter professing forgiveness and a desire for reconciliation, and inclosing the engagement-ring as a pledge thereof. But, for whatever reason made, this pledge seems to have been insincere; for of the same date is an extract from M——'s journal containing these words:

"Being nowe sicke past hope of recoverie, I doe hereby declare my ondyinge Hatred toward B——, himselfe and his posteritie forever; and I pray God that my Revenge be fulfilled to the Uttermoste—yea, at the Perill of mine own Soule! Amen."

These words, dreadful in any case, but doubly so as coming from a dying man, closed the collection. A note, written apparently by S——, the compiler, added that M—— had been buried in Trinity Church-

yard, and that the tombstone above him bore this inscription:

"In memory of — M—,
Who died February 6, 1771.
Requiescat in pace."

I laid down the manuscript, poured out a glass of wine, and sipped and pondered. The omission of all the names puzzled me. What object could the papers have been collected for, unless to record a vow of vengeance, and the causes which led to and justified it? Yet, without the names, was it not void of all significance? True, the omission had probably greatly increased the chances of the manuscript's being preserved through so many years; but preservation at the expense of identification seemed objectless. On the other hand, was it likely that M—, at the moment of dissolution, would have prayed for vengeance on his enemy, even at peril of his own soul, and have caused the prayer to be written down, without any purpose whatever? Decidedly not! How he had intended or expected his revenge to be accomplished was beyond my comprehension; perhaps he deemed the ring a sort of talisman, enabling his disembodied spirit to haunt the wearer. I finished my glass of port and set it down. A little wine always makes me imaginative!

While debating whether to light a fresh pipe or my bedroom candle, a loud ring at the door-bell settled the question for me. "Who the deuce can be coming here at this time of night!" I grunted, rubbing my eyes and yawning. A knock at the door heralded the entrance of my friend Browne. I had not seen him for a week or two, but he could not have changed more in as many years. I was quite startled at his appearance.

"Good Heavens, Browne!" I exclaimed. "Why, you look as if you'd seen a ghost!"

Browne started and looked at me for a moment; then he dropped into my easy-chair (from which I had incautiously risen to give him welcome), leaned his elbows on his knees and his head on his hands, gazed gloomily into the fire for a few moments, and then said, in a low, awe-struck voice, very different from his usual brisk, lively tone:

"And so I have, Simpson!"

I was completely unnerved. Until this evening I had known Browne as a rising young barrister, clever, sensible, and always in good spirits. The idea of such a man as he coming in suddenly and deliberately at that hour of the night and solemnly asserting that he had seen a ghost, was enough to unnerve any body. I was at a loss what to say, and therefore said the very last thing I meant to: I asked him to have a glass of wine!

Browne, without a word, filled my glass to the brim, drained it, filled it again, and drained *that*, looking all the while as if he

were going to be hanged. But I began to look rather serious myself then.

"Simpson," said Browne, abstractedly, again gazing into the fire, "I sha'n't blame you for being incredulous. I should have been myself—if I hadn't seen it with my own eyes!"

I began to feel a little nervous, I think. Browne was a larger man than I, and if, as I believed, his mind was affected, he might become violent at any moment. I felt that the wisest course would be to humor him.

"Of course," I said, "that alters the case."

Again Browne fixed his eyes on me, and nodded silently. How pale and strange he looked! Again he took the bottle, filled the glass, and drained it. Positively it was becoming unpleasant. Wine was the worst thing for any one in his condition, and—there were not more than three glassfuls left in the bottle.

"Don't you think," I began, "that you'd better—"

"I will!" exclaimed Browne, abruptly; "and as briefly as possible: it happened in this way. You knew I was engaged to Miss Hammill. Well, I went down there the other day to give her the engagement-ring. It was a queer, old-fashioned thing, that I found in a secret drawer of a desk that had belonged to some great-great-grandfather of mine, but handsome enough, for all that. I put it on her finger, and told her how it had been in our family a hundred years for all I knew, but that she was the first who'd ever worn it. Oh, how sweet and lovely she looked as she put her hands in mine, and promised me that as long as she lived she would remain true to the giver of that ring! And yet, even as she spoke the words, it seemed to me she shuddered convulsively and turned pale; and at the same moment I felt a sudden chill and horror at my own heart. But we both shook it off, whatever it was, and parted as usual, except that when I kissed her I could not be sure whether I had really touched her lips or not."

"I must say, Browne," remarked I, for my nervousness was beginning to pass off, and I felt sleepy, and in no degree inclined to listen to a lover's rhapsodies, "I don't see any thing in all this to warrant you in—"

I did not finish my protest; I was too much engaged in watching Browne fill and drain another glass of my port. I resolved not to interrupt him again.

"When I called the next evening," continued he, "I noticed a change in her at once. I know not how to describe it. It was not so much that she was cold to me, as that she seemed chilled herself. Her affections, her emotions, appeared in a manner paralyzed. She seemed to elude my grasp, so to speak; I couldn't reach her; I felt as if some nameless, impalpable, but insurmountable barrier had grown up between us since the day be-

fore. And several times I turned around, under the impression that somebody else was in the room. Her eyes wore a kind of sad, hopeless, distant expression, as if she felt that some one or something were taking her away from me. Yet still she wore the ring on which she had sworn to be true to the giver; but I saw her look at it once, and it may have been my fancy, but I thought she shivered, and grew even paler than before."

"Nothing but a headache on her part, and indigestion on yours, depend upon it," growled I, forgetting my resolution. But Browne didn't take any wine this time. He only sighed heavily and shook his head.

"The next day—yesterday," he went on, "I resolved to call early, take her out to walk, and trust to open air and exercise to set every thing right; for I could not, would not, believe that my impressions of the day before had been any thing but a morbid fancy. I felt quite reinvigorated, and walked rapidly along up Fifth Avenue toward her house. She lives, you know, corner of the avenue and Fifty-first Street. I had reached Forty-second Street, when I caught sight of her about a block ahead of me, and walking slowly in the same direction. She walked as if her life were ebbing away from her at every step; there was an indescribable droop and languor about her, so different from her usual springy step, and bright, cheerful manner. But I hardly more than noticed her; for, walking by her side, apparently talking to her, I saw, as plainly as I now see you," said Browne, raising himself to an upright position in his chair, and looking fixedly at me, "I saw—It!"

"It! Why, what on earth do you mean, Browne?" cried I, feeling cold chills run down my back and creep into the calves of my legs.

"The stout, burly figure of a man, with a high-crowned, broad-brimmed hat, and masses of rusty hair falling on its shoulders. It was clad in a cloak of dusky gray, and wore knee-breeches and stockings of the same color. It stalked along the pavement in clumsy high-heeled shoes, in a manner that would have been ridiculous, had I been in any mood for laughing."

"I should have felt in a mood to kick him into the street!" declared I, valiantly. But there was something in Browne's manner that made me a little doubtful whether I would have done so, after all. He continued, without heeding my interruption:

"It struck me as especially strange that, notwithstanding the great peculiarity of the figure's dress, manner, and general appearance, and though it was broad daylight and the avenue well filled, no one seemed to notice or even see It. Even Miss Hammill, I fancied, did not realize its presence, though she was certainly in some way impressed by

It. She never looked at or appeared otherwise conscious of It than as hearing, or rather feeling, what It said. Occasionally she would wince or shrink, as if its words were blows and stabs; and at such times the figure would appear vastly amused, throwing back its head, raising its hands, and contorting its burly form, as if indulging in an immoderate fit of laughter.

"By this time I had gained considerably on them, but was puzzled to observe that, although I had all along kept my eyes steadily fixed on the strange figure, I could not see It as distinctly as when further off. The sun still shone brightly, and the air was as clear and cold as ever; but the outlines of the shape were blurred or undefined, as if seen out of focus through a telescope. The nearer I approached, the more indistinct and shadowy did It appear, though still I was aware that It continued to stride along by Miss Hammill's side, ever and anon breaking forth into fresh ebullitions of ugly merriment. Nearer yet I came, until not more than twenty paces separated us, and now I could distinguish nothing save a kind of gloomy shadow that seemed to hover along the pavement. In a few steps more this, too, had vanished; and when I came up with Miss Hammill, I was only conscious of a subtle influence in the air. I felt again that mysterious chill of horror at my heart; and though I was walking beside her, and her arm was in mine, she seemed immeasurable miles away."

Browne paused and drew a deep breath. As for me, I felt the cold chills worse than ever. I poured out a glass of wine with trembling hand and drank it hurriedly. It was really a very cold night!

"Under such circumstances," continued Browne, "it was not strange that our greeting was quiet, almost formal. I knew she was aware of an evil presence, as well as I. Could she have been separated from herself, she might have seen It; as it was, that was reserved for me only. But we both knew that, even at that moment, It was there—between us, around us, exerting some malignant spell over us, to separate, perhaps destroy us. And why should It have power to injure us thus? Had she not sworn on the ring to be true till death to the giver? Was not I the giver? Yet she was lost to me, and I could feel the ring upon her finger, as her hand rested in my arm; it seemed to burn and sear my flesh, as if it had been heated in hell fire.

"So we walked onward, pretty much in silence, and soon reached her house. I bade her farewell on the door-step, for I had no heart to enter, even had she invited me. 'You have been alone all day?' I asked her, as I turned to go. 'All alone,' replied she, in a sad, far-away voice. 'I'm always alone now, except for my thoughts;' and then she

shivered, and shrank into herself, as it were from a stab. I left her standing there, and turning as I reached the end of the block, she stood there still; but oh, horror! by her side stood again that gloomy, fantastic shape, with high-crowned hat and dusky cloak, tossing its arms about, and actually capering with ghastly jollity! As I gazed, horror-stricken, the door opened, and she passed in and disappeared; and the mysterious figure, turning toward me, took off its hat with a flourish, and made me a low mock obeisance; then, with a parting wave of the hand, It stalked in after her. I knew that It and I would meet again; but something in my heart told me that I had seen the last of Alice Hammill."

"But, Browne," said I, in a low, remonstrative tone (why *would* that closet door keep creaking so!), "that was only yesterday afternoon, you know. Why, man alive, you must have been dreaming, or crazy! On Fifth Avenue—yesterday—in the middle of the afternoon—a healthy, sensible young fellow like you—talk of *your* seeing a ghost! Come, now, say you were fooling, Browne, do!" entreated I, making a violent effort to laugh it off. Heaven knows I would willingly have given half a dozen bottles of my best port-wine to have seen him join in, in his usual hearty fashion, and acknowledge it was all a hoax. But as I looked at him my laugh died away into a very questionable quaver. He didn't look at all genial.

"I reasoned in the same way, Simpson," said he, "after I reached home. I found that my recollection of the weird figure, though vivid enough, seemed more like the memory of a vivid dream than of a reality. Having escaped from its immediate influence, I persuaded myself it must be some extraordinary mental or optical delusion; and I went to bed, resolved to see whether a good night's rest would not aid in dispelling it.

"I woke this morning feeling fresh and strong, and determined to see Miss Hammill at once, tell her all my fears and fancies, and prove to myself and her that it was all a wretched delusion. So, having eaten a hearty breakfast at the Fifth Avenue Hotel, I set off, and in a quarter of an hour stood on the door-step. I rang the bell, and the servant appeared.

"‘I want to see Miss Hammill. Is she in?’

"‘Yes, Sir,’ returned the man; ‘but she’s very bad with the headache, and can’t see no one. The doctor says as how she’s out of her head, Sir.’

"‘Do you mean to say she’s insane?’ cried I, with a terrible throb of my heart.

"‘Not just that, Sir,’ replied he; ‘but he says she must be kept quite quiet, Sir, for several days; and, more especially, not see any one she cared for, Sir.’

"I turned away, sick at heart, and at that moment I felt again that nameless, creeping

chill, as if some unholy thing had brushed past me. Impelled by a dark foreboding, I looked down the street, and there, standing clearly defined in the crisp winter sunlight, I saw the Thing again."

"What! this very morning?" gasped I, half expecting to see the grisly phantom rise up between us. "Oh, not this very morning, Browne?" But it was no use.

"This morning," repeated Brown, "about eleven o'clock. It stood there beckoning to me impatiently, as if to follow It. It stamped its foot imperiously, and pointed down the avenue. And all at once a wild passion took possession of me. There stood the Thing that had destroyed my happiness, blighted my love, perhaps purposed to deprive me of life itself. My whole soul rose up in hatred and defiance. I burned to rush after It and grapple with It, though death should be the forfeit of the struggle. I did not care for death, if I might have revenge. And there It still stood, beckoning to me. I sprang down the steps, and then a ghastly chase began."

"Good gracious, Browne!" exclaimed I, piteously; "you don't mean to say you ran after It?" But he did not hear me—I don't think he knew I was in the room—so absorbed was he in the recollection of his dreadful adventure.

"The figure stalked on in front of me," said he, "with long, easy strides, once in a while cutting the most grotesque capers, flinging out its legs, and flourishing its arms abroad. It was always about sixty yards ahead, and I found it impossible to lessen this distance. But the faster I walked, the better pleased It seemed to be, skipping with frantic glee along the frozen pavements, and ever and anon half turning round to motion me onward still more rapidly. Stop I could not: I was drawn onward by an irresistible power that no will of mine could modify or overcome. But I had no desire to pause; my own heart drove me like a goad.

"As we kept on I noticed that no one saw the fantastic phantom, though, as It passed, men and women would shudder and turn pale, and draw their winter cloaks more closely about them. But, as our speed increased, I observed them stop and turn to look at me as I passed; and no wonder! I must have presented a strange spectacle, hurrying onward, with bloodless lips and face and fixed, straining eyes. But, so they did not stop me, it was little I cared for that.

"On we went, faster and faster! We passed directly under the windows of the Fifth Avenue Hotel, which I had left on my way up not half an hour before. I was dimly conscious of the crowd before the door, of the stage waiting for its passengers, and of the big clock standing on the sidewalk; but every thing seemed like a dream,

save only the ghastly shadow that still stalked before me with ever-increasing pace.

"We crossed the square, and now we were on Broadway. The dusky shape glided forward with easy speed, holding a direct line through the hurrying crowd. Faster yet! My breath began to come hard, but still I kept on; I was under my own control no longer. Union Square was passed, and Grace Church was close at hand. Turning the corner, the figure paused a moment and looked around, and I thought I could distinguish an evil leer overspreading its pallid features; then It waved its arms, and was off again.

"The whole stretch of lower Broadway now lay before us, filled from side to side with its endless stream of human beings, and the roar and rattle of horses and carts. But I, by virtue of my ghostly companionship, felt as far removed and isolated from them as if I were beholding them from another world. All that was most commonplace and familiar seemed weird and strange, and the only reality for me was the dreadful phantom that still led me on.

"At the farther extremity of the long road I could now see the spire of Trinity Church, outlined against the clear blue morning sky. At the same moment we quickened our speed; my guide seemed to flit like a passing shadow over the crowded sidewalk. His merriment also appeared momentarily to increase; he was now in a continual convulsion of chuckling laughter. On we rushed! Canal Street was passed; the City Hall was left behind; and at last the railing of Trinity Church-yard appeared, with the clustering groups of time-worn grave-stones behind it. And then the strain that had been drawing me onward ceased at once, like the snapping of a cord, and I realized for the first time how weak and exhausted I was. But still I staggered onward: I would see the end, though already half suspecting what it was to be.

"I reached the gate of the grave-yard and looked through the bars into the inclosure; and there, sitting on a gray, crumbling headstone, leaning with its head on its hands and its elbows on its knees, I saw It for the last time. It looked at me with an awful leer; a sombre shadow fell about It, which the cheerful sunshine could not penetrate; but the eyes of the mysterious figure emitted a dusky, phosphorescent glare, illuminating its features with a pale, unnatural light. The face was that of a corpse already mouldering into its native earth, and as I looked it seemed to crumble gradually away; the shadow grew duskier, until only the phosphorescent gleam was visible; then that too faded, an icy gust of wind swept through the church-yard, and I heard the clock strike noon."

As Browne concluded he sank back in his chair, and began to shiver as if in an ague fit. At such a moment all personal consider-

ations give way to the exigencies and impulses of the moment. I poured out the last glass of wine in the bottle, and myself forced it down his throat. Any thing was better than to see him thus; and he had said that the presence of the ghost always produced a shuddering! But I was resolved to believe my friend insane, or dying, or any thing else, in preference to putting faith in the awful vision he believed himself to have seen.

"Come, come, Browne, you're sick, and that's the whole difficulty," asserted I, stoutly. "Stay with me to-night, and if you aren't better to-morrow, we'll have the doctor here."

The wine seemed partially to have restored Browne's nerve. He sat up and gazed at me with a dead, hopeless expression in his eyes, that did not look much like improvement. He shook his head when I repeated my invitation.

"No, no," said he; "I must be off. I shall leave here next Monday, and shall never come back. Alice is dead—to me, at all events. Here," he added, handing me a card—"there's the inscription on the grave-stone: I copied it down after— And here's an old piece of paper, in which I found the ring folded up. It has some writing on it, I believe, and may explain something: you're good at that sort of thing. Good-night!" And before I could speak again he was gone, and I saw him no more. On the card was written:

"In memory of THOMAS MURRAY,
Who died February 6, 1771.
Requiescat in pace."

"Rather a satire on the old fellow, that 'requiescat in pace,'" commented I—"that is, if Browne *should* turn out not to be a lunatic!" The paper he had given me was old and yellow, and the writing on it appeared too illegible to puzzle out that night. So, resolving to see him the next day, and talk it all over in a sober and sensible way, I yawned and retired.

That night I had a very vivid dream, in which the marvelous story related to me by Browne was in some way mixed up with the old manuscript I had purchased in Ann Street. I imagined that all the blank spaces were filled out, and with the names of Browne, Alice Hammill, and Thomas Murray, I myself figuring as the copier and compiler of the whole.

With the first light of day I sprang out of bed, the influence of my dream still strong upon me, and rushed into my study after the manuscript. There it lay on the top shelf of my book-case, where I had placed it the night before; but a jar of some chemical liquid, which I remembered to have seen standing around ever since I was a boy, and which I had been told was an heir-loom in our family for many generations, had fallen over on it and broken, and the liquid had run

out and deluged the manuscript completely. With a sigh for the sad fate of the jar, I took down the papers and opened them.

The sight that met my eyes made me feel as if the roots of my hair were alive and moving! All the blanks were filled up with names, written in a pale, reddish ink; and they were all exactly as I had dreamed they were. Thomas Murray was the young farmer whose life had been blighted by the lawyer, who was none other than Browne himself! while the lady who had caused all the trouble was Alice Hammill! And—yes! I was there too! My name was signed to the note appended to Thomas Murray's prayer for vengeance—"John Simpson" in full!

"Now how the deuce," soliloquized I, "did those names get written down there? They certainly weren't there yesterday. Ah! here's one only half written! How's that? Ah!" I exclaimed, drawing a long breath of relief, "I see now! Sympathetic writing, by George! and it was the old jar of chemicals brought it out!"

Such was the fact. One of the names, written near a corner of the paper, had partially escaped being wetted by the liquid in the jar, and that part which had escaped was invisible, while the rest presented the same pale reddish tinge as the others. In this, likewise, I saw the explanation of the existence of the jar in our family during so many years. Doubtless my old ancestor, John Simpson, when he wrote the names in sympathetic ink, had provided himself with the reagent to be used when needed; and the occasion not arising during his own life, it had passed down from one generation to another, until all remembrance of its original purpose had been lost: fortunately, however, it had not itself been so forgetful, but had sacrificed itself to duty precisely at the proper time.

This turn of affairs, though decidedly exciting, substantiated my friend Browne's story too completely to be altogether pleasant. Comparing his copy of the tombstone inscription with that in the manuscript, I found them word for word identical. I next bethought myself of the piece of paper which Browne had found with the ring. On examining it I discovered it to be neither more nor less than the original of Murray's letter to Browne, professing reconciliation! Really, things were becoming disagreeably clear.

Had it not been that I accidentally became aware, about this time, that I was nearly frozen to death, I should probably have remained pondering over my mysteries all day in the peculiarly simple attire appropriated to repose. I now commenced the operation of dressing, holding converse with my reflection in the mirror the while.

The result of my meditations was that I had better hunt up Browne, tell him all I

had discovered, and consult with him on its significance and importance. The connection of the characters in the drama of a hundred years ago with those of to-day was fully established. The dreadful prayer for vengeance made by the dying Murray had evidently been granted—at the peril of his own soul, I could not doubt—but still granted. Only one mystery still awaited solution: why had the retribution come so late? why had it been reserved for my friend and the woman he loved to expiate the crimes of their long-buried ancestors?

Here the incident of the ring recurred to my mind. I remembered having idly speculated on the possibility of its being a talisman whereby the spirit of its owner might be enabled to persecute the wearer of it; and, looking at the matter in the new light I had obtained, it seemed not unfeasible. In his dying moments Murray had sent this ring, incrustated with the hate and passion of all the years of his blighted life, to the man who had ruined him. Doubtless he had believed that if he or any of his race were to accept and wear it, it would have power, if any thing could, to infuse into their hearts and souls some of the misery and poison which had been exhaled into it by his. Apparently it had been laid aside and forgotten until discovered by my friend; and Alice Hammill, the descendant of that family by the son mentioned as being absent in Europe, had received as a pledge of betrothal the greatest curse which it was possible to bring upon her. Acting upon her delicate and sensitive nature, the ring had distilled its morbid poison to the best advantage, paralyzing her with the ghastly shadow of the crime which had mouldered unavenged throughout a century. And Browne, by virtue of his love for her, had come in also for his share of the punishment so long deferred. Their souls had been united, and the same baleful influence that had poisoned her, had exercised its influence on him also. He had made her swear fealty to the giver of the ring; but was he the real giver? was it not rather the gift of the terrible phantom which had haunted them? and did not that oath give it the power to do so? For haunted beyond a doubt they were: whether by the actual semblance of a disembodied spirit, or by the fantasy of a diseased mind and imagination, made little difference: the effect was the same; and until we attain to a far more lucid theory for such mysteries than we possess at present, we must accept the old explanation as twice as simple and quite as probable as any other. But the question was now, what was to be the end?

I started out on my search for Browne immediately after breakfast. Not finding him at home, I thought it probable he would be at Miss Hammill's, and thither accordingly I

betook myself. But he was not there : and the servant who answered the bell told me that Miss Alice had been growing gradually worse, and that the doctor gave slight hopes of her ever regaining her mind. I have often wondered since whether she still wore the ring.

So all day long I wandered over New York, searching for my friend ; but night closed in, and still I had not found him. The following afternoon, however, I got upon his track, and followed him from one point to another till at last I traced him to the Hudson River dépôt. Just before I reached there the eight P.M. express had left, carrying him a

passenger in the sleeping-car. I heard the whistle of the engine as it rushed away, carrying many a soul on a longer journey than they had ever before undertaken : all the world has heard of the disaster of New Hamburg ! Living or dead, I never saw my friend again, nor was his body ever, so far as I know, recovered. Doubtless it was better so : he never could have found life sweet on earth again. But often, in the evenings, as I sit before my fire, I think of him and of the gray, crumbling tombstone in Trinity Church-yard, and marvel that life should seem so simple and commonplace.

A GOOD INVESTMENT.

CHAPTER IV.

ROBERT HAGAN was going forth to get himself civilized, but he did not know it. He was marching on to a better destiny, but could not foresee it. His pathway, as he went, was strewn with the scarlet and gold of ripening leaves, and he breathed that delicious and exhilarating air, mixed of cold and warm, which prevails where persimmons and papaws are sweetening in the clear sunshine that follows a morning of white frost. But Bob, insensible to all these, was heavy of heart. It was not because he was sundering the tender ties which had bound him to the authors of his being that he was down-hearted, for he cared not a persimmon for those ties or those authors ; nor was it because he was about to meet in combat the world, the flesh, and the devil, for he was not easily scared. He had been subject to such turns as he now experienced ever since he went bush-whacking, and shot his first man, and, though not practiced at self-examination, had a dull consciousness that they were in some way connected with that event. But his conscience—if that may be said to have been involved—was extremely torpid and undeveloped as yet, like all his other moral faculties. He felt gloom, not remorse. But as he continued on his way, and the exertion of walking brought the sweat to his forehead and sent the warm young blood to flush each extremity and surface, the physical triumphed over the moral, and the gloom dispersed as a cloud.

About four o'clock in the afternoon the colt and its conductor arrived at a farmhouse, in a field beside which a man and two boys were engaged in husking corn and loading it on a wagon. Bob walked directly in through the let-down rails, and began to assist in the work without saying a word, while the colt followed him in and fell to eating. The volunteer help labored so faithfully that by the time the sun went down,

and a woman appeared at the door of the house to call the hands to supper, the last shock had been husked and the last load was being driven to the crib. Bob followed the others in, but while they took their places at table, he took his by the fire. "Come and have something to eat," said the woman, laying a plate ; to which he, as by custom bound, replied, "Thank you, I ain't no occasion," and slowly took the offered place. The meal was a substantial one of fried bacon, saleratus bread, corn-dodgers, and coffee, and was eaten with no more words than were absolutely necessary. And after it was over, though the family conversed among themselves, Bob sat by himself and took no part. A bed was given him in the loft, and in the morning he was again invited to eat, which he did, with the same protest as before, that he had "no occasion." Then he helped dig potatoes until, as he thought, he had sufficiently compensated his entertainers for his meals and lodging ; after which he approached the farmer, and remarking that he must be about going, asked, "How much to pay?" Now when Bob had declared that he had no occasion to eat, he was ravenously hungry ; and when he offered to make payment, was without a cent in his pocket—which two falsehoods prove this one truth, that politeness is natural to man, even in the rudest places.

"Which way may you be traveling?" asked the farmer.

"I'm going down to the river bottom to hunt for a job. Do you think there's any chance?"

"I reckon not this time of the year. The bottom farmers is got a'most all their land into hay since the war begun, and don't hire much help anyhow. You can easy get a chance on a flat-boat, though, and them pays well."

"Yes ; but you see I've got my colt, and they wouldn't take *hit* on a boat, I don't suppose."

"Well, I'll tell you what. If you 'm willing to work among a parcel of Dutch and Irish, I reckon you can git a chance in the quarries round Buena Vista. I've heerd they was right scarce of men since them last big drafts. It's just down at the mouth of Lower Twin."

"Is it fur from here to the head of Lower Twin?"

"Only about three mile. The road goes all the way."

And Bob went on his way, ascending the valley until the hills that bounded it came close together, and their tops lowered till they were less than fifty feet high. Then, passing over a depression, or gap, he entered the chamber of Lower Twin, and followed that in its descent until it widened so as to inclose farms of large extent, and its walls towered to the height of six hundred feet, and came into the little quarry village of Buena Vista, on the Ohio River. The village, though no great things of itself, was to the uninformed backwoods boy something to wonder at with lowered jaw. It contained three stores, two churches, and a large steam-mill for sawing stone. A wider surface than its buildings covered was occupied by huge blocks of stone, each containing about fifty feet, piled high one upon another in long ranges bordering on the embranchments of a railway that descended by a steep inclined plane from the quarries up in the hills. While expending his admiration on these, Bob's attention was attracted toward the inclined plane, and, looking up, he beheld two rail-cars passing each other midway up, the ascending car empty, and the descending one laden with a block of stone like those in the piles below. When he saw this, and when, after the loaded car reached the foot of the descent, whence the iron rails extended toward the river by what seemed to be a perfectly level grade, he saw a brakeman mount it, detach the rope, and conduct it whirling and rattling away at a speed of twenty miles an hour, he "allowed it was a miracle," as he afterward confessed. Again, while he yet wondered, there came from up the river the hoarse, deep bellowing of a large steamboat, giving warning that she would land; and following that unearthly sound came the gentler clangor of iron upon brass as she struck her bell. Looking in the direction of these new and stunning attacks upon his sensations, Bob observed the village idlers gathering to the river landing; and thither, as fast as the resisting colt would permit, he followed, reaching the water's edge just as that grand and deadly creation, a Western river steamer, having turned herself in the channel, was approaching the shore, rising and expanding to view as she came till she filled all space in the scope of vision. And again the boy stood and wondered, as Archimedes himself might well

have done had he been there; and again he "allowed it was a miracle," as all must allow it was—a wrought miracle. The boat, having made her brief stoppage, was away again and out of sight ere Bob, withdrawing his eyes from the vision, became aware that he was an object of amusement to such of the little crowd as still remained at the landing. To them a "*creeker*"—as they called backwoodsmen—looking at a steamboat for the first time in his life was always a sight worth seeing.

But this one did not remain to be laughed at long; and disdaining to ask questions of his enemies, he found the way as soon as he could back to the railroad, knowing that by following its course he must finally arrive at the quarries. It led him first to the summit of the inclined plane, and from thence into a basin among the hills, whose bordering slopes were adorned with many a vineyard and orchard, and dotted with houses of the quarry workmen. Trudging on in the middle of the track, where it wound through a steep and narrow cut, suspecting no harm nor meaning any, a locomotive and train, laden with stone from the quarries, came suddenly upon him, allowing no way of escape except by tumbling headlong into a ditch, and dragging the colt after him. They say horses from rural parts, where no locomotives are seen, are not so liable to take fright, when brought face to face with one for the first time, as their ancestors of two or three generations ago were, and the reason for this improvement is supposed to be that news of the great invention has spread abroad among all the horse kind, through modes of speech such as Gulliver mentions. Like a country horse, backwoods Bob had heard descriptions of the locomotive, but, having never before met one, was more astonished than pleased with the adventure. And as he scrambled out of the ditch, and scraped off the thickest of the mud with a chip, he was sensible of a nascent desire to get back again to Flaming Rock. It was a miracle, he allowed; but he was getting tired of such miracles.

He continued on, however, and after going less than a mile further, came to a dead level space, where the track extended itself upon a surface of solid rock, and led up to where stood a large movable crane, which, just then, with a quick steam cough and loud rattling of iron joints, was hoisting toward the skies, at the rate of ten feet in a minute, one of the huge stone blocks before described—making the fourth wonder of the newly discovered world the amazed child of the woods had seen that day.

The sheet or platform of rock he stood upon was an uncovered portion of one of the ledges of that uncommonly level and distinct stratification of sandstone which is found in Scioto and Adams counties. It

was over three feet thick, and unvarying in its thickness for miles of extent. Geologically it is of Hugh Miller's favorite old red formation, but its actual tint is ashes-of-roses. The earth had been removed to the width of a hundred feet, and for several hundred feet along the hill-side. Near by the crane, men were at work with stout, short picks, cutting channels in the upper surface of the stone to the depth of six inches; and near to these, others had set a row of iron wedges in a channel already cut, upon which, one after another, in course, a strong man was delivering repeated blows with a hammer heavy as he could swing, whose effect was to rive the rock downward, straight as a plumb-line, through the whole thickness of the ledge. At the further end of the quarry a gang of about fifty laborers were engaged in excavating still farther the superincumbent earth, some of them with picks undermining the steep bank of bright blue marl, as high in some places as thirty feet, and causing it to fall in crumbling masses upon the floor of stone, from whose even surface others were shoveling it into barrows, and wheeling it off to dump into the ravine below. This was the kind of work for which Bob had been told hands were wanted. He could see no possible objection to it; and truly, for one who can wield a pick and handle a shovel as all of Erin's boys know how—that is to say, gracefully, and therefore easily, for the chief use of graceful movement is to soften labor—no prettier work can be found in the world than stripping stone in quarries like those.

The muddy, ragged, distracted-looking boy, as he stood holding by the halter his equally bedaubed infant Rosinante, so attracted the attention of the men from their work that the foreman had to reprove them; but he himself, on turning toward the object which had disturbed them, burst into a laugh, which was joined in by the whole band most uproariously. Never before that day had Bob been laughed at. The people of his own neighborhood saw nothing strange or ridiculous in rags and dirt, and besides, they seldom laugh at any thing. Seventy or eighty men ceasing their work to lean upon their implements and shout and scream at him in a concert, or volley, rather, of merriment, was an occurrence to him almost as miraculous as those others that had been battering upon his nervous system. His courage gave way completely: he broke into almost the only tears he had ever shed, and would have walked away, had not the good-natured foreman, seeing him turn to do so, called to him to stop, and asked what he wanted.

"I want to find out if there's any chance for me to get a job," he blubbered.

"What wages do you want?" asked the foreman.

"What you think I can earn," answered the other, too much humbled to chaffer about pay.

"When do you want to come on?"

"I don't know what that means."

"When do you want to begin to work?"

"Now."

"That's funny," the other exclaimed, favorably impressed by such promptness. "I never before saw a creeker who was willing to come on a job before the next day. But where do you expect to board?"

"Can't I live along with you?"

"Me?—oh no," replied the foreman; "but some of the men take a boarder or two. Ho! Nick Roth," he added, calling to him one of the shovelers, with whom he conversed for a few minutes in German. But Roth looked at Bob, and thought of what Mrs. Roth would say to his bringing home a boarder so forlorn, and finally shook his head and begged to be excused, and so did several other Germans, one after the other; and Bob's case again looked dark, when at last Tom Horrigan, a kind-hearted Irishman, moved to pity by the very appearance that caused the others to turn their backs on the poor fellow, volunteered to receive him into his own overcrowded family of ten children.

"There's my house over there," said Tom, pointing to a cabin across the ravine. "It's too late for you to make a quarter to-day, so you can't come on till to-morrow. You go over there, and tell Mrs. Horrigan you're comin' to live wid us, and she'll help wash the dirt off you, and give you a bite to eat, if you're too hungry to wait for supper."

So spake an Irishman! How can a people possessing sympathy and generosity such as the Irish are endowed with ever hope to thrive in a world like this?

The Horrigan family lived in a sufficiently unconstrained manner not to abash Bob when he first became one of them. But it was a pleasant family, and from Mrs. Horrigan herself down to the six-weeks-old at her breast (excepting one who took after the father) was a family of beauties, all showing that white skin and delicate bloom for which the Irish peasantry are famous, and which seems bestowed to display in picturesque contrast the war-paint of dirt which large families of poor children are apt to wear—especially Irish poor children. They lived well, for their head was a water-drinker, and earned extra wages; and Bob, who had insisted on fasting until the abundant supper was spread, had sufficient "occasion" to consume a full share of it. After the day's experiences, he could wonder at nothing; but he thought the saying of grace at the beginning of the meal, and Tom's smoking a pipe at the end, just as if he were a woman, were worthy of notice. In the Creek country only women smoke, while men chew.

On beginning work next morning Bob's

protector gave him a barrow and shovel, and taught him the fine art of handling dirt so as to obtain the largest result with the least expenditure of power.

"Take holt," said Tom, "wid your left hand just back of the bend, and take the handle in your right—so; now shove it under the dirt, keeping the blade close down to the stone—so; now pry up the load you've got by bearing down wid the right hand, bearing first on the heel of the blade and afterward on your left hand, which you don't raise till you've got all clear and the shovel is brought to a level; and then lift wid both hands just high enough for it to clear the rim of your barrow—so; now don't pitch it in, but hold steady your left and twist wid your right, and the dirt will tumble in of itself—don't you see?"

If poor Hugh Miller, when he did his first day's work in a quarry, had been thus considerably instructed in the manual of his implement, he would have suffered less than he tells us he did from tired muscles and blistered hands. Fortunately for our hero, he had been better hardened to labor than the young geologist, thanks to which and his learning aptly, he got through the day with no damage greater than a back-ache when sundown came.

As one day came and went, so came and went another, and the weeks, and the months. Bob pleased his employer, became a pet of the men, liked the work, and was happy, except for occasional dreams and passing clouds. His wages were fixed at one dollar and a quarter a day, being only a quarter of a dollar less than was paid to "full hands," as empty-handed poor folk are sometimes called. Loss of time on account of rain being deducted, his earnings averaged about six dollars a week, out of which he must pay four for his weekly board, leaving him only two dollars to buy new clothes with; and as his old ones were too dirty to wash and too ragged to mend, and as, moreover, to give credit to a creeker was a thing unheard of in the village store, his plight would have been intolerable, if the good Irishman had not declined to receive any thing of him until such a time as his earnings should re-establish equilibrium in his finances. Thus Bob was early enabled to supply himself with a flannel shirt, a pair of shoes, and a pair of breeches: the old coat and remnant of a hat could be made to do a little longer. At Mrs. Horrigan's express requirement, Bob adopted the custom of washing his face and hands and combing his hair before every meal, though he found it impossible to discover the sense of doing so. The influence of the family upon him was humanizing; especially so was their fun and mirth. Bob improved in his bearing, and grew sleek as well as clean; and when, at the end of six weeks, he got square with the world, and treated himself to a second-

hand hat, he actually found favor in the deep blue eyes of Bridget Horrigan, aged fourteen, a beauty with milk-white teeth, peach-like cheeks, brow of wax, and auburn hair, who had at first utterly and from the depths of her bosom scorned him. And Bob, on his part, with Bridget so much before his eyes, was little by little being taught what until then not sunrise nor sunset, nor the bridal apparel of his native woods at spring-time nor their royal array in autumn, nor rainbows nor wild flowers, had availed to teach him—namely, the meaning and the power of beauty.

But a change came. The priest who sometimes officiated at the village chapel became interested in the Horrigan family—partly on account of the father's worth, partly because the mother was pious, but chiefly, it may be boldly said, for the reason that the children were so very pretty—and obtained for Tom a situation as private watchman in an iron-foundry at Cincinnati; and in two months from the time when Bob first crossed their threshold, the whole family were on their way to that city. Bridget wept copiously at bidding Bob good-by, and he "filled up," as they say, though he didn't run over. Two months more, maybe, had done the business for him; as it was, he returned to the desolate cabin heart-sore enough. He found a German family had taken possession and were moving in. They made no objection to receive him as a boarder, but stipulated that he should aid them on Sundays and wet days in the labor necessary to put the house in more tenable condition than had sufficed for its Irish occupants.

The new home in which Bob found himself was different from the old one in important respects, not the least of which were soup, sour-kraut, sausages, and an unknown tongue: strange things to him all of them were, and hard to know and admire. The degree of economy and thrift, of order and neatness, too, which prevailed were difficult for him to understand or tolerate. Mr. Gottel, who governed in all things, on returning from the quarry would inspect the house narrowly to learn if his "frau," in his absence, had worked as diligently as he had himself been doing, and would even examine the washing and ironing departments. He knew as soon as he tasted the soup if it had been boiled slowly and long, as it should be, or quickly and but a short time, as it should not, and judged the bread with a taste as discriminating as it was severe. If aught was found amiss, he would scold his wife as if she were a child; in grave cases he would even beat her—all which discipline she in turn visited on the children; yet neither what she suffered nor what she inflicted seemed to imbrute her moral nature, or render Mrs. Gottel otherwise than a cheerful, buxom, good-hearted wife and mother.

The influences that now surrounded the

boy were quieting and regulating—in short, just what he needed. Besides what Mrs. Horrigan had taught him, Mrs. Gottel insisted on his giving up the practice of chewing tobacco, which he had just begun, to keep his shoes clean, and wear shirts of blue check, which he must change twice a week. Then she required he should perform various ceremonies relating to greetings and leave-takings, deference to elders, attention to guests of the house, behavior at table, and so forth, all which he found hard to do and thought useless. But before many months he felt grateful to her for the discipline.

CHAPTER V.

"Oh eyes, strange eyes, ye are a world
Where unseen spirits tread,
Upon whose banners, half unfurled,
The future may be read."

THE spring of the year 1865, that saw the close of the war, saw also the departure of Bob Hagan from the quarries, a much improved youth. In the school of labor and of civilization where he had passed the winter he had made commendable progress, evincing a capacity for improvement that proved his fitness to rise in the world, should circumstances be favorable. That capacity for improvement must be borne in mind as being an essential element in his character, and a ruling one in his future history. The colt, too, thanks to its owner's self-denial, had wintered well, but it would need during the coming season better pasturage than the quarry hills afforded, and such would best be found on some of the great farms of the river bottoms, where horse raising was largely carried on. So, for the sake of his protégé, Bob resolved on a new departure; and one morning late in April he asked for the small balance of wages that was due him, bade good-by to his companions in toil and of the household, and descended the hill, leading a good deal larger colt and carrying a much

heavier bundle than when he first ascended it five months before.

Taking the road down the river, he looked out as he went for handsome houses with large farm buildings, and as often as he came near one of such would go in and inquire if there was "any chance of a job" there for him. Repeated refusals did not discourage him, for he knew there must be room somewhere for a willing worker with strong hands; he was not "seeking his fortune," as young men are said to do when they go forth to shun hand-work, not to find it. He was not trusting to luck, but only looking for his place, and felt sure of finding it ere long. Still, it was fatiguing to make so many excursions from the main road to the river-side, where the good houses were mostly to be found; and after he had got as far as eight or nine miles from Buena Vista, and within a mile or so of one of the hundred American towns named Rome, decided to halt. The place he chose was an open space that lay between the road and the foot of a cliff on its right; and though too small to be inclosed, was large enough to afford a good bite of spring grass for the colt. The cliff was one of a series which in that place began to present themselves, jutting boldly out from the hills that run along the land side of the road, and indicate, with the diminished height of the hills, their more gentle slopes, and a general softening of the face of nature, a transition from a sandstone to a limestone base. They are outcroppings of a bed of magnesian lime rock so compact and regular in form, with such level lines of footing and coping, that they might be mistaken for remains of Roman walls or feudal castles, whose void places in our American landscape they very respectably fill. Indeed, to one who will but try to think so, they are as agreeable objects as any crumbling Roman stone fences or tumble-down medieval dwelling-houses. Nor was the cliff at whose foot Bob rested wanting in aught that nature can furnish to beautify decay. Virginia ivy, rooted wherever it found protection, clambered over its face, and every hollow or projection where soil had accumulated formed a natural vase of ferns, flowers, grass, or whatever plant had been wafted there in the seed. A group of beech-trees crowned the brow of the cliff, and a copious spring issued from its base, and made a brook that ran across the road. While the colt grazed, its master, seated on a log on the opposite side of the road, made his own meal of some bread and bacon and hard-boiled eggs, which Mrs. Gottel had placed in his bag when she bade him good-by, and of a good long draught of cold water that he took at the spring, resting on his hands and knees while drinking.

Resuming his seat to wait until the colt should get satisfied, he very naturally, for

"WHO ARE YOU? TELL ME WHO YOU BE, NOW!"

one in his situation, turned his mind's eye in the direction of the future. Not seeing much there, he turned and looked back toward the past, and there the first vision to rise was that of Bridget Horrigan. "But wasn't she handsome, though?" he said to himself. "What blue eyes she had! It seemed as if they could look right straight through a fellow, and not hurt him any, neither." Then, suddenly, with a sensation as if an icicle had pierced him, came the recollection of another pair of eyes, whose aspect, as soft at first as that of Bridget's, had, while yet he looked upon them, altered to that of a tiger, and made him feel that blood cried out against him from the ground. The carpet-bag lay beside him, and was open. An impulse, often felt before, though always resisted, forced him now to put in his hand and seize and unclasp the portrait case. With a shudder he looked. There was nothing there but the face of a child and the open, frank eyes of a child, which, far from taking any vengeful expression, seemed to soften and brighten as they met his own, and smile upon him with a living intelligence and kindness, and, even as living orbs might do, to vary each moment they looked, till they became radiant with a meaning of love, or loving friendship, or gratitude, or all. Startled, amazed, fascinated, he strained his vision to receive every ray that was beaming from the magical picture, though a convulsive agitation almost shook it from his grasp,

until bursting tears dissolved the enchantment, and nothing remained but a simple portrait, upon whose glass incasement the great hot drops were falling and splashing.

All which had prevented his being aware that a horse had stopped to drink at the brook, whose rider, a girl of sixteen, attracted by his singular agitation, was curiously observing him. She was plainly attired, but very beautiful, with heavy black tresses, and dark, deep eyes, no whit less potent than those which were so moving his very soul. As, gradually coming to himself, the youth looked up and saw her, he started to his feet, moved falteringly a few paces forward, and gasped out, so low as to be scarcely heard, "Who are you? Tell me who you be, now! Tell me quick, now! Oh, do!"

And who was she, in the name of wonder? *The girl of the portrait!* with the same manifold eyes, only wiser and sweeter from three years of ripening, regarding him with blended sympathy, curiosity, and amusement.

His address startled her, and a slight flash of anger came that for an instant recalled the tiger glance of old, while something in the lines of the brow, in its partial effort to contract, brought up a face he had hoped, and even prayed, he might never see again, either waking or sleeping; but recovering herself quickly, while she drew in the loosened rein, she looked full in his eyes, and in tones befitting her type of face, with its brunette tint, arching brows, Roman nose, short

upper and full under lip, even teeth, and strong chin, replied, with a sad dignity, "*A prisoner of war!*" Then, turning, struck her steed, which started off galloping down the road. An hour later her questioner, who had not, meanwhile, even though with intense study, discovered in the reply any solution of the mystery of either the one apparition or the other, was leading the colt in the same direction, going in search of his "job" and his destiny. At the end of another hour of fruitless self-bewilderment, to the entire neglect of the job, though perhaps in the full pursuit of the destiny, he became aware he had forgotten his business, and stopped to observe where he was. He was opposite a gate which opened from the highway into a private road that conducted, by a straight line across the bottom, to a house about a mile distant that stood on a slight swell of ground near to and fronting on the river. Contrary to usage in that new country, whose axe and rifle bearing settlers deemed their vocation was, first of all things, to fell trees and kill Indians, and would as soon have thought of raising broods of the latter as new plantations of the former, the avenue was bordered with large buckeye-trees, equally the pride of the Ohio wilderness and the gardens of the Champs Elysées. It was, besides, made more attractive as well as useful by a covering of gravel, and by thorough ditching at the sides. The house, seen at the end of the vista, was peculiar too, in being built not of logs, or boards, or brick, but of stone; and though devoid of architectural ornament, except what resulted from the useful and comfortable additions of a piazza in the rear, a two-story porch in the front, and an open belvedere on the roof, was—by virtue of its liberal proportions, the material used in its construction, and the outside aid of a commanding site decked with old trees, shrubbery, and vines, besides a garden before it, where in summer-time sunflowers and hollyhocks grew—a most respectable and gentleman-like habitation, as it was a credit to the mason who built it, namely, the late Governor Metcalfe, of Kentucky. When Bob appeared at the back-door and inquired of a young girl who came to answer his knock if there was any chance for him to get a job, he took off his hat, as he had done that day each time he made a like application. Mrs. Gottel had taught him that German trick of the hat; and though he had, while with her, often rebelled against her instructions, yet as she had on parting especially urged him to do so, on the ground that it would help him to obtain employment with the right kind of people, he had, for the occasion, consented to practice it. As he stood, hat in hand, decently clad, and with as good a bearing as any other gentleman, there was certainly no objection to be made on the score of personal appearance.

The young girl, pretty as he was, and that is saying a good deal, did not scruple to look at him closely; then saying, "I'll see," disappeared. A man of fifty-five years returned with her presently, who scanned the applicant even more closely; after which he said, "So you want a job, my lad. What wages do you expect?"

"I want what you think I can earn after I've worked with you a while. But can you board my colt?"

"Oh yes; but I shall have to charge you something. You can't raise a horse for nothing, I suppose you know, in these times. Let us have a look at him." Then walking around the new object of scrutiny, with whose points he seemed pleased, he asked, "What breed is he?"

"He came of one of the mares that John Morgan's men rode when they made their raid."

"That isn't a bad pedigree. Those fellows were better mounted than them that followed after 'em. Suppose you call him a Morgan horse; though he carries his head and bends his neck mighty like a Stockbridge Chief, and he's the color of Stockbridge too."

The farmer then turned his attention again to Bob, and asked him several questions, which being satisfactorily answered, he consented to take him on trial, and, if his work suited, to pay him, besides boarding and washing and keeping the colt, the sum of ten dollars a month. The young "Morgan" was turned into a rye pasture near the house, where he soon testified his appreciation of the new arrangement, by eating voraciously and frisking extravagantly, while his master was shown to a large garret room in which were beds for six persons, and, having deposited his effects, was afterward taken to the barn and set to work at chopping sheaf oats in a hay-cutter.

Mr. Damarin, the owner of the house, and of the farm (measuring just one mile square) to which it pertained, derived his name and a portion of his blood from one of the unhappy French emigrants whose fortunes were wrecked in the attempt to establish a settlement on the Ohio near Gallipolis—an attempt which failed, owing to a deficiency, common to all their nation, of what may be called the emigrating faculty, or the faculty of being able to endure a painful existence for the sole benefit and advantage of posterity. The father of Bob's employer, who left France when he was but a boy, and who drifted down stream with what little he could save from the wreck, till he tied his boat opposite where the stone house was afterward built, had found it possible to become a backwoodsman, and after a life of hardship was able to leave to the only child that remained to him the very pretty farm of "Stone House." The son, although blessed

with five children to provide for, had found it easier to settle each one of the three eldest on as large and rich a farm as his own, by purchasing land for them in the further West and sending them out to be their own pioneers, than his father had to provide for but one. The youngest boy, for whom the home farm was reserved, had, of course, entered the army when the war began, and had steadily risen from the grade of lieutenant to that of colonel, with a brevet of brigadier-general. His regiment would soon be mustered out of service, and his return to his home was the great event of the immediate future of the Damarin family.

Mrs. Damarin and her daughter Polly (the girl who met Bob at the door) had every day, since news of the mustering out came, enjoyed a good cry and a good laugh over the happiness that was coming, without either of them being able to tell which they enjoyed most, the laugh or the cry. Mrs. Damarin was a Kentucky woman, from Mason County. She was handsome, and had always been handsome; was healthy, and had always been so; was cheerful and vivacious, because healthy, handsome, and good; was an excellent wife, mother, and housekeeper. She thought she believed in Old-School Presbyterianism, and was sure she did in the very theological Breckinridge of her native State. Her height was five feet ten inches, and her weight one hundred and eighty pounds. There are many such in Kentucky, and if there were more like her in other States, well would it be for America.

Polly bade fair to become as handsome a woman as her mother, and as large, though unlike her in many respects. The girl's hair was auburn-red, and her eyes of a warm brown color that suited the hair. She was at the brother-worshipping age of fifteen; and now that her idol was about to be restored to her, her happiness knew no alloy, save from the persistent refusal of her sole school-mate, companion, and friend, Bella Johnston, to be happy too.

CHAPTER VI.

"What though her angry glances dart,
She's hawk in eye, but dove in heart."

THE eyes the poor boy had beheld that day had been too much for him and too many, and an excellent cure for his daze-ment and amazement was the discipline of grinding for an hour at the crank of the hay-cutter. The monotony of the motion soothed his senses, and the labor of it opened his pores and quieted his nerves, while the sharp look-out constantly needed to save his fingers from being chopped in pieces withdrew his thoughts from wool-gathering, and fixed them on the practical business of the hour,

which was chopping oats. When the horn sounded for supper he followed the other farm people to the washing-place by the cistern, on the back piazza, and there, taking his turn, washed, combed, and dusted; then entered with the rest the large kitchen, where a long table was profusely spread. At the upper end of the board the family of the employer were placing themselves, while the employed took their seats at the foot, all as in feudal times, only the fare was such as feudal castles could seldom dispense: for was not this in the lap of the Ohio, and was not a Kentucky matron president of the household?

Without taking his eyes off his plate, Robert accepted and ate all that was offered him by those sitting near, and rose at the end with a consciousness that his new start in life was being made under most favorable auspices. Following his companions out of the house, he strolled with them to their habitual place of resort for rest and gossip during hours of leisure. It was on the bank of the river, without the gate of a flower garden that was in front of the house. A bench had been made by turning upside down an old dug-out canoe, on which those found seats who did not prefer to lie on the clean grass or lounge against the trunks and roots of the great old apple-trees that shaded the place. These trees were the only survivors of a flourishing orchard that formerly stood at the back of the log-cabin built some sixty years before by the first proprietor; all their fellows, following the fate of both the cabin and a frame house that succeeded it before Stone House was built, had one by one been undermined by the continually widening river, and swept away on its swift current. The ruins of the brick chimney of the frame building still lay on the shore, fifty paces out from the foot of the steep clay bluff that formed the river's bank, which rose to a height of thirty feet above its gravelly base, that made the shore, and sixty feet above the level of "low water." Before bed-time the new-comer had made good progress in getting acquainted with his future comrades.

Early next morning Mr. Damarin gave Robert, as he preferred to call Bob, his orders for the day, and explained the routine of work specially allotted to him. Among other things, he was to rub down, saddle, and bring to the door soon after breakfast every day two of the horses for the use of "the girls," who, it seemed, daily rode over to the parsonage, about four miles distant, where they received private instruction from the excellent and also reverend Mr. Adamsfall, a Union refugee from the valley of the Holston, and the officiating clergyman of the church where the Damarin family attended. One of the girls was Polly Damarin, and the other Bella Johnston. Prompt to the hour, Robert led the steeds to the

horse-block, and having tied one of them near by, held the other beside the block. Presently the girls appeared. Polly, coming first, greeted the timid fellow with one smile for recognition, and three for his awkwardness. After she was, by his truly awkward help, mounted, he led up the other horse for the other girl, resolving as he did so to commit none of the blunders he did in his first attempt, but making as many others in their stead.

"There, that 'll do, thank you. I've got it now. Let go, please," exclaimed a voice he had heard before. The steed flung his head free from the hand that still clutched the bridle at the bit, without power to obey the request to let go, and cantered away with—the girl of the portrait—the prisoner of war!

During that forenoon Robert resolved a score of times to run away, each time in a different direction, and as often altered his mind. His uncertainty arose from mere inability to fathom his own emotions, and understand why he should wish to go. Being, of course, destitute of any notion of the romantic, though his heart cried out "Run," his head could perceive no reason why it should transmit the command to his heels; so he staid. But he suffered horribly; and when at length the two young horsewomen on their return came in sight, racing with each other down the avenue, he went out to meet them with the feelings of one who advances perforce to receive a third visit from a ghost. But the girls had come home in glee-some mood, and under cover of their merry nonsense he was able to attend to his duty. And the daily recurrence of that duty, which he learned to perform better and better each time, became before many days the chief pleasure of his existence, and, more than that, the efficient means of his elevation and advancement. The girls soon began to take notice of their humble attendant, and in time learned to like him. Conversing occasionally with him, they began to feel an interest in knowing his history, and put him questions on that point, which he evading to answer, they became even more interested in his mystery. They gave him advice, which it is to be hoped was well considered on their part, for, were it good or bad, he was sure to follow it. Thus he became a regular attendant at church, and when one day they detected him with a quid of tobacco thrust in one cheek, before Bella had half done storming at him the weed was discarded, and forever. They discovered one day he was absolutely unable to read, and thenceforth his instruction in reading, writing, and ciphering became their daily business and his very great pleasure; and as he had uncommon aptitude, there is nothing wonderful in the fact that, with such helping, he learned what was essential in all three studies before the end of a twelvemonth.

But twelve months is a good way ahead of our story. Bella had called herself a prisoner of war. The reason why she insisted on giving herself that singular designation will be found in the following extract from a letter written by Colonel (then Captain) Damarin, dated from Northern Alabama in the spring of 1862, and addressed to his parents:

"....We have overrun a good deal more ground than we are able to hold, and must soon prepare to get out of this; indeed, we are doing so now. I have found myself a good deal embarrassed by a charge which Providence seems to have cast upon me in a singular manner. Two weeks ago, while employed on detached service with three companies of our regiment, under my command, we came upon some of Turchin's men just as they were about to sack a seminary for young ladies, situated about thirty miles from here, the inmates of which we were able to save from frightful treatment. Among the scholars was a girl from South Carolina thirteen years old. Soon after we expelled the ruffians, and while a squad of our men were guarding the place, my command was attacked by the rebels, and though we managed to drive them off—no thanks to Turchin's fellows, who ran at the first fire—it some way happened in the confusion of the fight that this poor child received a disabling wound, though not a very severe one, and got separated from her companions, who escaped to the protection of the attacking force, while she remained in our hands. And as we were compelled, a few days afterward, to abandon our position and fall back to the river at this point, she had to be brought along, and was placed with our own wounded on board a transport steamer used as a hospital. To-day it is determined to send this transport home with a load of the more serious sufferers, and as the country about here is in a dreadful condition, overrun by stragglers from both armies and by gangs of disorderly negroes, and as there is much confusion and uncertainty in all our movements just now, I see no better way than to leave her on board, and let her go with the rest to Cincinnati, in the hope that my dear father will be so good as to meet her there, and see that she is kindly treated and put in a safe way to be returned to her home, which is somewhere on the Waccamaw River. The surgeon in charge has promised she shall remain on board the boat until father can get this letter and go down to receive her.

"She is a beautiful and intelligent little creature, but full of the strangest notions, and a good deal of a spitfire.

"One of my men insists that she was in the act of firing a pistol at our party from the ranks of the assailing force when she received her wound; but I can hardly believe it. However this may be, she hates and scorns us as only a she-rebel can, and, in fact, is more violent than any I ever met. Would you believe it? she has taken up the idea that we captured her in battle, and that she is actually a prisoner of war! Nothing I could say had the least effect in dispelling the notion, or abating her extreme rancor, and she parts from us as from her mortal foes. But please do not let this at all prejudice you against the poor unfortunate child. For me, it is rather amusing than otherwise.

"I can not write more. The steward of the boat is John Grooms, a Brush Creek boy, and he will dispatch this letter as soon as he gets to Cincinnati. He will also hand you two hundred dollars—a portion of my pay lately received, and which I beg you will use, so far as may be necessary, for the benefit of the 'prisoner.'"

On receiving the above letter both Mr. and Mrs. Damarin went at once to Cincinnati, and brought back to Stone House with them the wounded and disabled but uncon-

promisingly rebellious Miss Bella Johnston. The kindness with which they nursed her might have mollified one who had been less thoroughly grounded in the gospel of State rights, nullification, and secession; but no freshly caught tiger's cub ever proved more untamable than she. Though evidently an affectionate child, thoughts of parents and home, so naturally present to one in her situation, seemed really to give precedence to thoughts of the war, of the part her native State had in it, and of that State's grandeur and chivalry, its sovereignty and nationality. All this, which seemed so ridiculous to her protectors, who had only that weak sentiment of sectionalism which prevailed in the Northern Border States, was the result of efficient causes—of teachings whose character and object all the world now understands, acting upon a peculiarly ardent and self-devoting nature. It was nothing less than the much glorified national or provincial egotism called patriotism, pure and exalted; patriotism, hot and furious; patriotism, blind and gone astray; but still patriotism of the very same quality with that which moved Joan of Arc and Charlotte Corday to do unladylike things, and make themselves conspicuous—and Charlotte and Joan were much older girls than Bella.

She soon recovered of the wound, and when she became fully aware they were laughing at her in earnest, learned to hide her feelings, and covered up the fire of her wrath under the ashes of her desolation, where they smouldered in secret, with only an occasional gleam or flash, which would sometimes burst out when the family conversed in her presence, as they freely did, concerning the war and the tidings of its progress. But it almost killed her to sustain the pressure of the moral atmosphere in which she was, that bore down upon her breast and brain as with the weight of innumerable pounds to every square inch of their surfaces. And the result was an anomalous mental and moral condition, which ended in producing a character needing to be judged with charity in order to be judged justly.

One of Bella's faults—and the hardest of all to forgive—was her not feeling, or at least not manifesting any sense of, her dependent condition. She had not scrupled on her first coming, and repeatedly afterward, to declare she could consider them only as enemies of her country, whom it was her highest duty to hate. Nevertheless, while earnestly trying to perform this patriotic duty, she could not help finding out before she had been with them long the goodness of her two elder foes, and the loveliness of the younger one, who insisted on

loving and making love to her whether she would or not; and in the end became truly attached to all three, though perhaps without knowing it; and with the exception of occasional scenes of unpleasantness, her deportment was that of an adopted daughter. For Captain Damarin, however—her captor, as she deemed him—she was better able to retain her cherished ill-will, since he remained constantly in the field, and down to the close of the war did not once return home.

A great grief was added to Bella's cup after her arrival at Stone House. Mr. Damarin made faithful efforts to communicate with her family, in order that he might restore her to them. Nothing was elicited until after more than a year, when a letter was received from the overseer of the plantation of Mr. Johnston. It stated that the gentleman in question had three months before undertaken to run through the blockade in a schooner laden with his crop of rice; that he was supposed to have escaped capture, but had not since been heard from; that anxiety on his account, and grief for the supposed death of her daughter, had caused Mrs. Johnston to fall ill and die; that no near relations of the family remained in the neighborhood; that the two brothers of Bella were officers under John Morgan when he made his raid, and were thought to have been killed or to have escaped across the Ohio River during the fight at Bluffington Island, as their names were not on the list of those captured.

After this letter was received there seemed nothing further to be done, since, if Mr. Johnston or either one of his sons were living, and should return to Waccamaw, he would be sure to learn news of Bella, and make proper exertion to recover her. In expectation of hearing from some of them, the remaining months and years had gone by, leaving a strong presumption in the minds of Mr. Damarin and his family, though not in Bella's, that all were dead. And now the war had ended, though she was urgent to be sent forthwith to her home, and was at the same time in daily hopes of seeing some one from there come and claim her, Mr. Damarin was in doubt what steps to pursue, and waited, and urged the impetuous girl to wait, until his son could return and give his counsel. In this last he had no little trouble, since the strongest reason for delay, namely, the presumption that all her family were dead, could not be told her; and she was at times more difficult to manage than ever before.

And thus matters stood at the time when Robert Hagan obtained employment at Stone House.

A MERRY CHRISTMAS.

THE sun shone with a golden light in the sky; the snow shone with a white glare on the ground; the clear, cold air reddened the cheeks of the pedestrians, whose feet sank into the crisp snow with the crunching sound peculiar to zero weather as they hurried onward, listening to the lively little sleigh-bells, the deep, single notes of the church-bells, and the erratic chime of St. Nebat's, which, having lost its final note, persisted in running down the scale—do, si, la, sol, fa, mi, *re*; do, si, la, sol, fa, mi, *re*—until all the musicians within range, wrought up to frenzy by long-continued expectation, felt like opening the window and roaring out the missing final *do*. It was ten o'clock; breakfast was over, and I was amusing myself with Christmas decorations. The room was large, with a rich-hued carpet of small, mixed figures, crimson curtains, and a crystal chandelier filled with wax tapers; one or two vivid pictures stood out on the plain gray walls, and an easel held a little crayon sketch of two elves dragging a Christmas-tree across the snowy fields toward a lighted cottage beyond. In the centre of the room a round table was spread with a crimson cover, odd Chinese china, frosted glass, and just enough silver to light up the whole; while from the *épergne*, the mantel vases, the tops of the pictures, and the gilded scroll-work of the mirror, sprays and branches of holly, with its red berries, and hemlock, with its brown cones, clambered in gay profusion, filling the warm air with the fragrant odors of the forest. A few easy-chairs, a broad sofa, with heaps of Turkish cushions, and an upright piano, completed the furniture of the room; a recess, filled with shelves, held books, free to the touch and destitute of lock, glass, or cover—old friends worn with the long watches they had kept in kindly companionship through my otherwise lonely hours. Looking around my domain, I felt satisfied with the warmth, fragrance, color, light, and silent music of the whole. Although an old maid, and consequently forced at times to eat the legendary salad for the solitary, I did not mix it with the pronged malice, bladed severity, and acid temper ascribed to my class; but with health as firm as the hard-boiled egg, temper as even as the oil, and, above all, the crested silver fork of wealth, I cheerfully mixed my salad—for the solitary if need be, but for the social if friendly hospitality could accomplish the wish. This bright Christmas-day I expected Cousin Eva, Aunt Penelope, and a distant relative, Mr. Adam Brown, to dine with me. Lonely body that I was, I preferred to live in a city boarding-house, where space was necessarily limited, and one room served as parlor, library, and dining-room; but deft Lucy, black Tony, and the skilled cook of a

neighboring restaurant managed to make my one room as pleasant as the long vistas of a palace, perhaps more so.

St. Nebat's kept at it; and as I equipped myself for the outside weather, and mentally supplied the missing *do*, Tony brought me a note.

"DEAR ALEXANDRINA,—A telegram just received from Adam. He can not leave Persepolis until to-morrow. Eva has a bad headache, and I do not like to leave her. You will be lonely: come and dine with us. In haste,
PENELOPE WALLACE."

I was vexed. I was more than vexed; I was angry. I glanced at the holly, the wax-lights, and the glittering table; I silently enumerated the courses of my festal dinner. I wrote the following reply:

"DEAR AUNT PEN,—I am sorry you can not visit me to-day, but I shall not be lonely, as I have other guests invited. Yours in haste,

"ALEXANDRINA SPENCER."

St. Nebat's still rang its dislocated chime, and going out into the clear air, I joined the bustling throng all intent on Christmas, although its interpretation varied from sacred anthem to jovial chorus, from turkey and Champagne to sausages and lager, and from an æsthetic discussion to a billiard match. Still angry, I entered St. Nebat's open door, and seated myself in a corner of my pew. The chime ceased, and the organ pealed forth a joyous strain, as a host of children standing in the aisles walked forward, singing their Christmas Carol. Though poorly dressed, and showing many wan and sickly faces among their ranks, the little voices rang cheerily out in a genuine child's tune, that almost sang itself along by sheer force of the swinging melody:

"Carol, carol, Christians,
Carol joyfully;
Carol for the coming
Of Christ's nativity;

And pray a gladsome Christmas for all good Christian men:

Carol, carol, Christians, for Christmas come again!"

A little lame girl filled her place in the ranks with earnest energy, singing sweetly as her crutches sounded on the stone floor. As she passed me a ray from the stained glass windows lit up her pale face, and the feeling came over me like a wave, "Do I repine, with health, friends, and fortune, while this poor waif, helpless and destitute, so cheerfully bears her hard lot?" When the children were seated the service began, and from the opening anthem to the closing benediction all breathed the spirit of Christmas. Glad music told the tidings of great joy, the royal Psalms and glowing pages from the Prophets were read, and the sermon made an appeal for charity—responded to by heaped contribution plates, not a hand refusing its mite on Christmas-day. Down the aisle and out into the street the thronging congregation whispered its greetings

and good wishes; sorrow seemed forgotten, and for once care seemed left behind. Finding the lame child with some difficulty, I endeavored to persuade her to return home with me. Blushing with timidity, little Jane murmured that Mrs. M'Niel might not like it.

"We will go and ask Mrs. M'Niel," I said, only the more determined as obstacles rose in my path; and taking the child in a carriage, we drove down into the business part of the town, and threading our way through lanes in the rear of sombre warehouses, stopped at a brick tenement-house which the child pointed out as "home." Following the sound of her crutches through the dark passages, I came at last to a small room, where a gaunt woman, introduced as "Mrs. M'Niel," received me with "An' what's yurr wull with Jane, ma'am?"

I explained that I had seen the child at church, and wished to take her home to dine with me.

"Oh, ye can take her an' welcome! It's not much use she is to me, with them legs. Her mother died in the next room an' left her a baby—the swatest lamb of the world as iver was, an' I hadn't the heart to turn her off. She's a good little thing, but she can't arn much, and me a-working me fingers to the bone, the mother of ten of me own."

Leaving a present for the ten, I hurried away from the wretched home, and, with Jane beside me, drove rapidly back into the airy avenue where I lived. "The mother of ten! the mother of ten!" kept ringing in my ears. A troop of ragged boys and lank girls seemed to file past me, and yet that overworked mother had found time and heart to pity the crippled orphan. I began to wonder how the great scales of compensation are balanced, and whether I should be found wanting when the ease and idleness of my life were weighed against me!

My warm room greeted me with a fragrant welcome. Never before had it seemed half so comfortable. But the other vacant places at the table must be filled; and leaving the wondering child ensconced in my easiest chair, I mounted to the fourth story of the boarding-house and knocked at one of the little doors in the circle, like a round-house, where a number of lodgers were stowed away at half price under the roof. A fat little woman appeared, and with some surprise invited me to enter. The cell contained a cot-bed, a bureau, one chair, and a tiny stove. The temperature must have been ninety, and there was no way of ventilation save by opening the one window, and sitting, as it were, out-doors in the freezing air. Miss Michon offered me the chair, seating herself upon the bed; and as I gave my invitation I could not help noticing, as I had often noticed before, how remarkably plain she was!

"Poor old lady," I soliloquized as I returned to my rooms below, "you, at least, have been spared the snares of Cupid. You, at least, know nothing of the bitter-sweet thought, It might have been!"

Here some one passed me, and looking up, I recognized Mr. Blunt, a young clerk, with whom I had never before exchanged a word, although he had been in the house for six months. He came and went with silent regularity, and beyond his name I knew absolutely nothing of his history or personal attributes. Obeying a sudden impulse, I invited him to dine with me. The young man turned back, bowed gravely, but courteously declined, with a trace of dignified reserve which did not displease me. Something in his dark eyes impressed me, and, curious to see more of them, I explained my situation, and with earnest cordiality begged my fellow-boarder to accept the vacant seat at my table. "I am but a lonely old maid, Mr. Blunt," I concluded. "Will you not help ire to spend a merry Christmas?"

As I spoke the grave face relaxed, and after a moment's hesitation Mr. Blunt accepted the invitation, and I returned to my room as triumphant as a manager who has just secured a star of the first magnitude.

After lunch little Jane fell asleep on the sofa, and sitting by the window I watched the sleighs gliding by, and thought of the many spirits of Christmas Past—nearly fifty of them—some rosy with hope, some dark with disappointment; but the majority prosaic, even-tempered ghosts, not above an interest in the merits of the dinner. Perhaps a tear or two dimmed my eyes as an old enchanted memory stole into my heart; but I was obliged to confess that the last time I saw Edward he was unromantically stout, and Edward's wife—"manœuvring little wretch" of the past—seemed but a faded, care-worn woman of the present, with very little apparent happiness to rouse my regretful jealousy. Twilight came, little Jane awoke, Tony replenished the fire and lighted the tapers, and I consigned my ghosts to the past, as Miss Michon appeared, clad, of course, in a black silk, and looking plainer than ever. A few minutes before six Mr. Blunt came in, polite but rather silent. "Poor fellow," I thought. "He is embarrassed, no doubt. Probably he is from the country, and knows little of the world. I must try to draw him out."

When the last dish was in place upon the table my oddly assorted party took their seats, and Tony began his ministrations. For the purpose of making my guests feel at ease I made an effort to supply conversation, asking Miss Michon questions suited to her probable capacity, talking about the country to Mr. Blunt, and about the Sunday-school to little Jane. It was dull work. A

monologue is apt to be dull. But as Tony was removing the soup, who should appear but my delinquent guests! Adam had been "released, after all;" Aunt Pen feared I "should be lonely;" and Eva had miraculously "recovered from her headache." Here was a dilemma! Miss Michon fanned herself, little Jane stared at Eva, Mr. Blunt arose and stood by his chair, and I found myself the most embarrassed of the party. However, I made the best of it. "Three more plates, Tony. Excuse the crowded table, Aunt Pen. Miss Michon, allow me to introduce to you Mrs. Wallack, Miss Rose, and Mr. Brown."

Completing the introductions, with some difficulty all were seated, Eva next to Mr. Blunt, Aunt Pen between little Jane and myself, and Adam by the side of Miss Michon. It *was* funny, but I had no intention of laughing, and began to carve with dignity. The situation, however, was too much for Tony. He presented a plate to Miss Michon; snatched it away hastily, and placed it before Aunt Pen; took it back again, under the pretense of dusting it, and finally let it fall on my head in his vain efforts to decide the proper etiquette of the occasion. Jolly Miss Michon burst out into a peal of laughter, Eva joined, Aunt Pen yielded, the young men followed her example, and we all laughed until the tears stood in our eyes, beginning again and again as the embarrassed Tony, after diving for the pieces, thought it necessary to make a profound salam to each guest in token of his contrition. After this introduction, as may well be imagined, there was no constraint to mar the dinner; Eva chatted gayly with the clerk, Adam kept up a fire of repartee with Miss Michon, and Aunt Pen talked with little Jane as though she had known her for years. In a gustatory point of view the dinner was perfect; the fire glowed, the tapers shone brightly, the holly exhaled its spicy perfume, and the guests were merry. "Hail, mince-pie!" exclaimed Adam, as Tony brought him a piece of that goodly compound.

"Without the door let sorrow lie,
And if for cold it hap to die,
We'll bury it in a Christmas-pie,
And evermore be merry!"

"What is that you are quoting, Adam?" asked Aunt Pen.

"An old song of the fourteenth century. But why do you say 'quoting?' Am I not capable of wooing the Muse myself? I assure you I am brimful of poetic fire, and can gush right out at any time. I will give you a Christmas poem this instant, and not only that, but I will give it without the capitals. We had a Christmas dinner in 1871: if you only could have been there to hear and see the fun! Victoria sent her regrets—she really felt too chunky; but Darwin came, and brought with him his old ancestral monkey.

Guy Lawrence Livingstone appeared, and brought 'ye ancient wassail;' but John Hay said he could not come unless we'd let him 'rastle.' The sweet Sorosis came in force, and fell into a spasm; and Huxley sent us each a slice of patent protoplasm. Chang, the giant, came with Barnum and Mrs. Tom Thumb tiny; and then, for something lively, we sent out West for Cheney; but lest the ministerial East with jealousy should burn, we invited, in a body, the Methodist Book Concern. Bergh could not leave his patent-preservation-tadpole tanks; and, from mere force of habit, the Eds. declined with thanks."

"I yield! I yield!" interrupted Aunt Pen; "any thing for peace. Hereafter, Adam, I will never question your genius, but admire your poetry with all my heart, provided you do not ask me to listen to it."

"I have always thought Adam's poetry pre-Raphaelite," observed Eva.

"Pre-Adamite," said Aunt Pen.

"Ex machina," suggested Mr. Blunt.

"A second Mr. Slum," exclaimed Miss Michon. "Indeed, I am not sure but that your allusion to Darwin is a base imitation of Slum's epic on Mrs. Jarley's wax-work show."

"And that reminds me," said Adam, "that the genius of Christmas is gone. Could we but collect together to-day those whose hearts he has comforted, whose gloom he has cheered, whose burden he has lightened, whose struggles he has encouraged, what a mighty company, of all ages and classes, would fill these streets, crowding each other to pay a farewell tribute to the beloved author! The critics might pipe their feeble strain on whatever note they pleased, but the people recognized and crowned their favorite; and on this Christmas-day there will be many a sigh over the missing Christmas story, and many a kindly memory of the man to whom Christmas was a real festival, full of love, peace, and good-will toward men. Friends, let us drink to the genius of Christmas—to the memory of our dear lost friend, Charles Dickens."

Tony filled our glasses, and with reverence we drank the toast. All but little Jane, who asked, timidly, "Who is Charles Dickens?"

"A writer, my dear, who loved little children and wrote about them," said Aunt Pen. "One of these children, a little boy called Tiny Tim, was something like you. At a Christmas dinner this little boy said, 'God bless us, every one.'"

"Amen!" said little Jane. She thought it was a prayer. Perhaps it was.

"What a pure essence of Christmas fills that story!" observed Eva.

"That is because there are children in it," answered Aunt Pen. "Children make Christmas what it is. I remember my baby niece,

little Plum, cherished a firm belief that Santa Claus lived up the chimney; and as Christmas drew near, and visions of possible gifts filled her little heart, she would go slowly and timidly to the fire, hesitate a moment, and then deliver a loud 'Tea-set!' up the chimney, running away instantly as fast as she could, with a vague fear of pursuit from the unknown deity. We used to hear her calling out these abrupt messages at all hours of the day: 'dolls,' 'No's yark,' 'yittle tart wid horses,' were fired up the chimney like minute-guns. Once, when she had been fretful, her mother endeavored to quiet her by the suggestion that Santa Claus might hear her. This seemed to have an effect. Miss Plum sat demurely on her little stool for some time, but finally the idea of an unseen sentinel became oppressive, and going to the grate she called out, 'Santa Claus, you needn't watch me any more; my mamma can take care of me.'

We all laughed.

"That is like the little boy who could not go to sleep because those horrid angels watched his bed," said Miss Michon. "Poor children, how they are misunderstood! At Christmas time, for instance, some persons seem to think that an elaborate dinner is all that is necessary to make the little folks happy, when ten minutes gives them all the food they want, and the long hours become a torture."

"A Christmas dinner," began Aunt Pen, with didactic solemnity, "is an important event. Its component parts should be as carefully selected and mixed as those of a mince-pie. We all know that nine-tenths of the mince-pies are failures, and likewise of Christmas dinners. In the first place, children should only come in with the dessert; thus their little souls will not be tortured by the endless procession of dishes, and their little bodies worn with fatigue from sitting three hours in the same chair. Then, as regards the adults, they may be classed in two broad divisions—flirting people and eating people. For the first class we must have proper objects for admiration; for the second a perfectly cooked dinner. Who has not seen ladies yawning behind their fans, evidently thinking the dinner tasteless, because the spice of flirtation was lacking? Who has not seen gentlemen secretly watching the clock with weary ennui, when one pair of bright eyes would have shed radiance over the scene? Depend upon it, my friends, that as long as we ignore the fitness of things, as long as we refuse to provide proper attractions for the three classes of guests, our Christmas dinners will be melancholy failures."

"This one is a success, Aunt Pen," observed Adam, as he cracked the nuts. "All your three classes are here."

Eva drew herself up as she noticed the

general smile, and turning to the clerk beside her, asked, with vivacity, "You have been in the army, I see, Mr. Blunt?"

Hastening to the relief of my protégé, I answered for him: "Eva, Mr. Blunt is still very young, and, besides, he may have had other and weightier duties to fulfill. Some of our warmest patriots could not give more than their earnest hopes to the cause."

But pretty Eva persisted. "I know I am right," she continued. "I am sure Mr. Blunt was a soldier. He has that erect, martial bearing which civilians never acquire."

Here Adam straightened himself involuntarily.

"You are right, Miss Rose," replied the clerk, quietly. "I served in the Union army during the rebellion, and but a moment ago I was thinking of the Christmas-day I spent in C—— prison."

"Tell us about it, please," asked Eva, eagerly.

"The war is over, Miss Rose, and the public interest in its details is already subsiding. It is best that it should be so: let us heal the wounds, rather than reopen them."

"My interest is not subsiding," exclaimed Eva; "and as long as this generation lives the memory of those heroic deeds will be held sacred, and thousands of unwritten histories, told by returned soldiers, will kindle again and again the old ardor. What exciting days they were! Living as we did far from the border, we caught only the echoes of the storm; sometimes a new regiment would pass through the city with waving banners and confident step; sometimes a train of cars filled with wounded and dying would halt in the dépôt, and we tried with food, cordials, and fruits to alleviate the sufferings of the men; but some were past help. How well I remember the thrill that passed through our hearts when in the early Sunday morning stillness came the newsboy's cry passing up the street—'Extra, extra; another great battle!' Were you in the Christmas battle of Stone River, Mr. Blunt?"

"No; I had not that glory. I was taken prisoner by Forrest while out on a scouting expedition, together with most of my company."

Again the young man paused; but when we all begged him to proceed, he at length consented, and spoke as follows:

"I was born in Ohio, and educated at one of the State colleges. Here, among others, I formed a friendship with Grove Seaton—a delicate boy, comparatively friendless, who suffered much from the petty persecutions of his turbulent companions. Grove took a fancy to me in his silent way, and I protected him from many an onslaught. We passed two years together, and then I left the school to enter upon business life; but in the midst of busy occupation I often thought of him, and wondered whether I should ever

see his pale face again. At the opening of the rebellion I volunteered, and was appointed captain in one of the Ohio regiments, my brother Jim, a mere lad, serving as private in the same company. As he was determined to go, I was glad to have him so near me. A campaign full of the hardship without the glory of war fell to our lot. We marched back and forth hundreds of miles through Tennessee and Kentucky, often traveling in a circle, and retracing our steps of the previous day, burning and rebuilding bridges, collecting supplies, guarding passes, acting as reserves, but never actually participating in any thing more than a skirmish with guerrillas and bush-whackers. Sometimes we hovered on the edge of the battle, and when it was over helped to bury the dead; but our numbers continued intact until a few days before Christmas, when my company, out on scouting duty, was surprised and captured by Forrest with a force of three times our number. This prince of raiders was a terror throughout the Western battle-fields. He rode through the country with such dashing speed, he possessed such accurate knowledge of our movements, and knew the ground so thoroughly, that he always held us at a disadvantage. We never knew exactly where he was, and he generally appeared at the very last place where he was expected. Always in a hurry, he wasted no time upon his prisoners, but sent them off South under guard. In this way we too were treated, and within an hour after our capture we were on the road to C—— prison, in Alabama. Once fairly started on our weary journey, we were stripped of our valuables, our clothes exchanged for ragged garments, our boots and shoes taken away, and thus, barefooted, we were hurried along over the rough roads, and forced to keep pace with our mounted guard. Gradually the food gave out. I do not think the Confederates were in fault, for provisions were scarce, and some expected supplies failed to appear; but we were soon reduced to a small piece of dry corn-bread for a whole day's rations, and starvation began to count its victims. Oh, you ladies and gentlemen living in the midst of plenty can form no conception of the horrors of real, gnawing hunger! Some of the men went raving mad, some dropped without a groan, and others, like my brother and myself, marched on with dull endurance, hardly knowing whether we were dead or alive. One cold morning found our miserable band within a few miles of C——. I remember some one said, 'It's Christmas at home to-day.' I had forgotten it, and raising my eyes at the words, I happened to catch a glimpse of Jim's face as he trudged by the side of a Confederate. Poor boy! The man was eating some bacon and corn-bread as he rode along, and Jim's hungry eyes followed every morsel with the pathetic

earnestness of a starving dog. He did not speak, but kept up with the horse, never dropping his gaze, although the road was full of pitfalls, as though fascinated by the very sight of the food. The mute appeal of his white, hollow face, and the thought that it was Christmas-day, overcame me, and the first tears of my manhood rolled down my cheeks.

"Toward noon we were marched into C—— prison. It was an open lot, encircled by a high fence, and crowded with ragged, dirty, and sickly prisoners, some of them looking more like savages than civilized Americans. A rough shed ran along one side of the fence, but as only a small portion of the men could be crowded within its limits, by far the larger number were exposed to the weather, and consequently were suffering from low fever and diseases of the lungs. As we entered this abode of misery we were immediately surrounded by the gaunt inhabitants, and overwhelmed with questions. Most of them seemed half crazed; but the saddest spectacles of all were those who sat apart, sternly hopeless, waiting for the deliverance of death.

"During the afternoon a rumor passed through the prison that food was coming. By this time the horrors of the scene had sunk deeply into my mind, my courage fell, and I knew I could not long endure such a life. Having carried Jim to a corner, I sat down beside him. The boy was somewhat delirious, and I almost wished I could change places with him, for then I need not think. There was one at home who would hear of my capture. Need I say my thoughts were of her?"

At this point Adam awakened to a new interest in the story.

"The food came at last. Bad as it was, hunger rendered it palatable. Even Jim revived a little; and one of my company, a young man from the same town, confided to us his intention of trying to escape during the night. It was like running the gauntlet of a thousand deaths; but he was not to be persuaded from his purpose; so I gave him a penciled note, breathing a courage I myself was far from feeling, to take to my darling— I beg your pardon; the word slipped out by mistake," stammered Mr. Blunt, with a scarlet face.

"No mistake at all," exclaimed Adam, as we all laughed, and the sympathetic Miss Michon wiped her eyes. "It is the sweetest word in the English language, and I often use it myself."

Here there was another laugh, and more blushes besides those of the young soldier, who hastened on with his story.

"The man got away that night; but, of course, we could not tell whether he was alive or dead. A cold rain set in, and Jim sank rapidly. Morning dawned, and another

er wretched day opened before us. I tried to occupy myself in making a wooden fork and plate, so as to save every crumb of our scanty allowance of food; but as the cold increased, and our wet clothes grew stiff, I gave it up, and, throwing myself down beside Jim, I tried to pray. I was roused by a hand on my shoulder, and looking up I saw a Confederate officer, accompanied by a surgeon, who was ministering as far as he could to the necessities of the sick.

"Are you ill, my man?" he asked.

"No, but my brother is;" and I attempted to raise Jim's head. The officer stooped to assist me, and as our eyes met we recognized each other. It was Grove Seaton, my school-mate.

"I need not tell the details of the rest. We were taken from the prison, clothed, warmed, and fed, so that in a few days Jim, with youthful elasticity, recovered sufficient strength to travel. We were then immediately exchanged, and sent North through the lines, reaching home but a few days after my little note was received; for the man got through, after all. And so we escaped, while thousands were left to suffer. What a strange chance it seems!"

"I do not call it a chance," said Aunt Pen, solemnly. "It was the direct reward of your kindness to that friendless boy."

Aunt Pen likes to point a moral.

"What a Christmas!" shuddered Miss Michon. "But I am glad she got the note."

"Fill the glasses, Tony," said Adam. "Ladies and gentlemen, let us drink to the health of 'Darling,' wherever she is, and may we all have the pleasure of meeting her in person before another Christmas comes round."

"Give her this from me, Mr. Blunt," said Eva, slipping a ring from her slender finger.

"And now," said Aunt Pen, after another half hour had glided away, "it's after midnight, and little Jane's eyes look sleepy. Come, my dear, put on your hood: I shall take you home with me."

Then followed a general exchange of adieux. As I assisted Aunt Pen in arranging her numerous wrappings, I whispered, "Do you really mean to take little Jane with you?"

"Why not, Sandie? Your description of the poor child's home dwells in my mind. Eva will probably leave me before many months, and I must have something young about me. I have taken a fancy for little Jane, and, besides, I think a good surgeon could cure her lameness. But be that as God wills; I like the lassie, and will take her as my Christmas present."

"Mr. Blunt," said Adam, as he shook hands with the young soldier, "our acquaintance is of too recent date for me to press myself upon you; but I trust that we shall be friends from this day; and as you are a comparative stranger in the city, you must allow me to

do something toward advancing your interests here, as I have many acquaintances among the merchants. Who knows," added Adam, with a smile in his brown eyes, "but we two forlorn bachelors may keep next Christmas in homes of our own, with our dar—" Here the reprobate was ignominiously dragged away, and we lost the conclusion of the sentence.

"Who, indeed?" said Mr. Blunt, as he took leave of me. "The future is uncertain; but I have to thank *you*, Miss Spencer, for a very happy Christmas."

"Not so happy as the next one will be, Mr. Blunt, if two friends can bring it about," I answered.

How the grave face brightened, and what a warm pressure my old hand received!

"Isn't he sweet!" exclaimed Miss Michon, as we two were left alone. "He reminds me so much of my poor lost Archie."

"Your brother?" I asked, as she wiped her eyes.

"Oh no! my lover. He died at sea. We were to have been married as soon as the voyage was over. I have my wedding-dress still. I will show it to you some day. See, here is his picture," she continued, taking off a locket and opening it. A bright, manly face, with clustering brown hair and deep blue eyes, gazed at me from the ivory.

"And who is this on the other side?" I asked, seeing the fair, dimpled face of a lovely young girl.

"That is myself, taken at sixteen. Poor Archie! But I know he is happy, and waiting for me; so I never weep and lament. He never liked to see me sad. Well, good-night, Miss Spencer. I have had a charming Christmas; and I only wish you could have known my Archie."

"At least I may know you," I replied, kissing the cheery little woman. "We will keep each other from feeling lonely, my dear."

"We will, we will!" cried Miss Michon. And she was as good as her word.

St. Nebat's clock struck one as I stood alone by the dying fire, and thought over the events of the day. The simple words of an ancient carol came unbidden, and sang their quaint music through my brain:

"I saw three ships come sailing in
On Christmas-day, on Christmas-day;
I saw three ships come sailing in
On Christmas-day in the morning.
Oh, they sailed into Bethlehem
On Christmas-day, on Christmas-day;
Oh, they sailed into Bethlehem
On Christmas-day in the morning.

"And all the bells on earth shall ring
On Christmas-day, on Christmas-day;
And all the bells on earth shall ring
On Christmas-day in the morning.
And all the angels in heaven shall sing
On Christmas-day, on Christmas-day;
And all the angels in heaven shall sing
On Christmas-day in the morning."

A CUP OF COFFEE.

"Coffee which makes the politician wise,
And see through all things with his half-shut eyes."
—*Rape of the Lock.*

MAN is so disposed to look upon himself as master of all he surveys, that he quite forgets how often he becomes the servant of his slave. Thus he thinks of the plants in nature only so far as they minister to his wants; some to warm and clothe him, others to feed and refresh him, while still others build him houses or vessels to carry him across the ocean. He has taught them all to be useful, from the highest to the lowest; from the towering pine-tree in distant Norway to the humble herb at his feet; from the graceful palm-tree of the tropics to the lowly moss on sterile rocks. The golden lichen furnishes him with a dye, and the archil gives him litmus. In England and in France thousands of families live on sea-tang and algæ; while the creeping moss hid under Northern snows in Iceland and Siberia restores his health and lengthens his years.

But every now and then the plant seems to be able to take a strange revenge on its merciless master, and to obtain dominion over him, either by the force of habit or the power it holds over his passions. Some change into fire-water, and make the civilized man their slave and their victim, while they destroy the whole race of the red man; the poppy changes into opium, and leads to terrible wars between England and China; tea becomes a necessity, and brings about the revolt of the colonies; and even the lowly cereals and the deep-buried potato in years of short crops bring dire misfortunes upon whole nations. Cotton has been proclaimed king more than once, though unable to maintain itself on the throne, and tobacco has become a necessity with millions of men.

Among these tyrants of the human race coffee is by no means the least powerful, though one of the gentlest masters to whom man submits. A thousand million pounds are said to be annually consumed of the precious bean; and the host of laborers, agents, and merchants whom the small green fruit sets in motion and supports by its travels all over the world is almost without number. From its homes in distant lands—from the mountain wilderness of Abyssinia and from the favored islands of the West Indies, from the sunny valleys of Brazil and from the broad plains in which the Orinoco flows, from Java and Ceylon, as well as from Happy Arabia—the fragrant bean comes to refresh, strengthen, and comfort the exhausted system of countless nations. What it costs us annually can hardly be computed, although it has been ascertained by busy statisticians that Europe could support its enormous armies and pay its annual taxes by simply abstaining from coffee, sugar, and tobacco. It

is surely a strange dominion which these plants exercise over our proud race. The juice of an Indian cane becomes a part of our daily food; the ill-smelling leaf of an American plant, used originally by savage red-skins, is a necessity for all nations; and the fruit of a shrub growing wild in Arabia is valued alike by man and woman all over the earth! The proud son of the highest civilization can no longer live happily without the coffee of African robbers, the tobacco of red barbarians, the tea of despised Chinese, and the sugar of the wretched Hindoo or the enslaved negro. He can not break his fast without coffee, nor finish his dinner; he spends hours every day at the coffee-house, and keeps himself awake at night by a cup of coffee; the whole social life of many nations is based upon the insignificant bean; it is an essential element in the vast commerce of great nations, and compels the building of docks and ship-yards, of vessels and railways, of vast magazines and magnificent exchanges. We may well inquire, therefore, after the history and special nature of that remarkable beverage which we so slightly call only a cup of coffee!

Recent travelers in Africa have confirmed what was before only a surmise—that the true home of the coffee-tree is to be found on the lofty terraces of the Upper Nile, where it is still found growing wild. Unfortunately, here also history leaves in the dark the name of the benefactor who first conceived the grand idea of making an infusion of coffee beans; and instead of authentic accounts, we find nothing but legends and traditions, which surround the happy man with the halo of a saint; for the Persians will have it that their great prophet was once suffering sorely, and sent his prayers up to the throne of the Almighty, whereupon the Archangel Gabriel, who had already taught Mohammed to read by thumping his head three times on the ground, taught him also to drink coffee by forcing him to swallow a black beverage made from the bean in his garden. The Arabs, on the contrary, not willing to admit the great ingenuity of their Eastern rivals, maintain that a pious dervish, who condescended in his leisure hours to tend a flock of goats, noticed how merry they became after they had eaten the leaves of certain shrubs. They jumped and gambled and bleated in so remarkable a manner that he became envious of their happiness, gathered a few leaves, chewed them, and felt as merry as his goats! Like a faithful believer in the prophet, he did not keep his discovery to himself, but communicated it to others; the prior of a Mohammedan convent in Persia recommended it to his monks as a means to keep them awake at their nightly vigils; and soon the use of the pleasant decoction became quite general in Eastern countries. From that time there has been no Christian

or Mohammedan monastery in the Orient that has not its huge coffee-kettle continually simmering over the fire, in order to assist the fainting devotion of its pious members; and to this day the faithful believer thinks it an act of meritorious piety to drink much coffee while performing his sacred duties, so that every mosque is filled with the pleasant fragrance, and cups of coffee are incessantly distributed among the devout worshippers "for the greater glory of God."

Like most of the heroes of antiquity, coffee has, therefore, its legends and miracles duly enhancing the splendor of its birth, and soon martyrs also and apostles were not wanting. The very dervish who had obtained from his merrily capering goats the secret of the delightful drink, fell a sad victim to his discovery; for envious brethren accused him openly of having drunk intoxicating beverages in violation of holy laws, and he was in imminent danger of his life. Fortunately the new drink gave him the wit and the eloquence to persuade his adversaries to make at least a trial of his favorite plant. They consented, they drank, they grew merry, and with one accord proclaimed ever thereafter that coffee was the gift of their great prophet, especially designed to stand them instead of dangerous wine. They adopted it at once as the national beverage, insisting, however, upon its being drunk pure and unmixed as it came from the hands of beneficent nature, while they looked with disgust upon the unbelieving *giaour* who has been denied the power to enjoy it thus, and must needs sully its purity with milk and sugar and other horrid admixtures. Another pious man, Gemal Eddin, who was soon after priest at Aden, but a native of Djemen, introduced the precious bean into Arabia, and obtained by his benefit such renown and reverence that he was made the patron saint of coffee; and no faithful follower of the prophet concludes to this day his morning prayer without wishing the holy benefactor the highest joys of paradise. What at first was done only by the priests to keep them awake during nightly vigils, soon became customary in Mecca also; and the habit spread rapidly through all Eastern lands, thanks to the thousands of pilgrims who annually crowded the shrines of the holy city, and among other blessings obtained there a knowledge of the grateful effects of coffee. As early as the first years of the sixteenth century Cairo had already public coffee-houses, and Aden exported the bean in large quantities. The plant itself, however, did not reach Mecca till 1567.

The first dervish was, it seems, by no means the only martyr who was destined to suffer in the service of the new favorite. The persecution began with two learned physicians of Mecca, who had devoted many years to the question, Was Mohammed a

doctor? just as our age applies this and similar questions to Shakspeare. These two pundits found some verses of the Koran which seemed to condemn the custom of making coffee in the holy mosques. They thereupon opened a regular crusade against the beverage, and discovered, as physicians have always been able to do when they wished it, a thousand bad qualities inherent in the bean. They demonstrated to their own satisfaction, and that of numerous followers whom coffee had probably made bilious, that the popular drink excited the imagination, led to new interpretations of the words of the prophet, and thus caused dangerous heresies. They next appealed to the emir, who, as a pious Mohammedan, entered most zealously into the matter, and convoked a solemn council of physicians, lawyers, and divines, before whom Coffee was to appear and to be tried. For a time nothing criminal could be discovered, until one of the presiding physicians, with marvelous self-denial, openly declared that coffee was intoxicating, for it had made him repeatedly drunk! Having sacrificed his character in order to carry his point, he did not hesitate to endure also the *bastinado*, to which he was instantly sentenced for the heinous crime which he had confessed, and all for the satisfaction of hearing the emir issue an edict which prohibited the use of coffee in Cairo and the whole pashalic. But his joy was short-lived; for the sultan, the great Father of the Faithful, did not confirm the decree, openly denounced the council as an assembly of asses, and summoned the unlucky drunkard to Constantinople, where his head was politely placed between his feet. Henceforth no one dared to disturb the consciences of pious Mohammedans with such idle scruples, and coffee reigned supreme in the Orient. Poets have sung the praises of the black beverage; priests and monks have preached in its favor; and to all, from the sultan on his throne to the *fellah* in his hut of Nile mud, the precious drink is a daily source of enjoyment. Only on the northern coast of Africa the heresy of mixing sugar has gradually crept into use; and there the French learned, when they conquered Algiers, the secret of making an orthodox cup of coffee: black, like hell, strong, like the devil, and sweet, like woman!

Long before this a man from Damascus had carried the fragrant drink to Constantinople, and in 1534 opened the first public-house for its sale in the brilliant city. Soon others arose, generally near mosques and public baths, and speedily became the favorite resorts of divines and learned men, who loved to discuss knotty questions of faith and politics under the happy influence of the gentle stimulant. Such discussions, however, aroused the suspicions of the master, who suddenly ordered all coffee-houses

to be closed, hoping thus to make an end to politicians also! The priests were ordered to thunder anathemas against the black drink; the judges were directed to proceed with the utmost severity against delinquents who would drink coffee; and ample rewards were promised to all who would denounce transgressors of the sultan's order. But it was all in vain. The cup of coffee was stronger than the Ruler of the Faithful; it continued all-powerful in the secrecy of the harem; it came forth boldly on public square and covered bazar; it established itself once more in cozy coffee-houses; and ere long it was master again, openly defying the mighty sultan on his throne. Wisely yielding to a power which he could not conquer, the latter ordered that no coffee-house should henceforth be licensed which had not its complement of story-tellers, jugglers, dancers, and snake-charmers, and thus prevented the former political discussions. The cup of coffee was so victorious that henceforth the wife could demand to be divorced from the husband who failed to supply her sufficiently with coffee. Servants receive their fee under the name of coffee-money, as in Germany it is called Trinkgeld (drink-money), and in Spain and Portugal it is given for snuff; and even the poorest of the Osmanli passes no day without enjoying the indispensable comfort of a cup of coffee.

When the new favorite had thus conquered the East, it soon found its way to Europe also. The precise manner in which the victory was achieved is not known, since, like all bad habits, the custom of drinking coffee began in different parts of the Occident at once, and grew in strength mainly by dint of persecution. Ellis considered it likely that the Venetians, whose dominions were so near the Turkish empire, and who then almost monopolized the trade with the Levant, were the first to introduce it: at least a Venetian merchant, De la Valle, wrote in 1615 from Constantinople that he should bring his correspondent some coffee, which he believed was a thing unknown in his country. An Augsburg physician, Rauwolt, had, however, some forty years before written a public account of the strange black beverage which he had drunk in Aleppo; and an Italian, Prosper Alpinus, had in 1580 seen the plant itself in a greenhouse in Cairo. Whoever may have the merit of having first brought the bean to Europe, Pietro de la Valle was certainly the owner of the first public coffee-house in Europe. He opened one in Rome in 1626, although his countrymen had sold the bean then already for eleven years. A Frenchman, Merville, did the same in 1644 for Marseilles. The first cup of coffee had been drunk in Paris at the house of a great Eastern traveler, Thevenot, who had brought the bean and a great fondness for it home with him from the East; still he and

his friends were the only persons who enjoyed its pleasant effects for many a year. It was only in 1669 that Soliman Aga, the ambassador of Sultan Mahmud IV., made the use of coffee more general. At the first audience he had of Louis XIV. he took occasion to mention the subject, and ever afterward made it a point to treat his visitors to the orthodox beverage of his native land. At a sign from their master, black slaves in bright turbans and sky-blue gowns entered, holding upon a small silk cushion a costly cup of finest porcelain, poised in a larger cup of silver or gold filigree, and offered it on their knees to the visitor their lord chose to honor. The new fashion took amazingly; the minister's house became immensely popular, and all the élite of society crowded his salons to enjoy the bitter black draught. When the liberal Turk left Paris the taste had become so general that an Armenian, Pascal, opened a large coffee-house in 1672, although he had to suffer most dangerous competition from a Sicilian, Procope, who offered the delightful beverage in the streets of the city at a very low rate, notwithstanding the price of coffee was then forty dollars a pound. Henceforth coffee-houses sprang up in all the fashionable portions of the city, and became the meeting-places of the great world of artists and scholars, laying thus the foundation to the custom which makes now these houses the resort of nearly the whole male population of Southern Europe, who spend there the larger portion of the day. Then duchesses and countesses would drive up in splendid equipages to drink their cup of coffee without alighting; poets there read their productions; authors exchanged criticisms; actors and actresses were praised or condemned, and even diplomats and great generals met there to discuss the greatest questions of state. The lively French mind was so much pleased with the gently stimulating beverage that they called it the drink for the mind, *par excellence*, and ascribed to it universally the power of cheering the melancholy and of soothing great grief. Hence, when a lady at court received the sad news of her husband's sudden death, she exclaimed in her anguish, "Woe is me! Bring me quick a cup of coffee!"

London owed its first acquaintance with coffee to a caprice. It seems that in 1652 a wealthy Turkey merchant, Mr. Edwards, had brought home with him from his Eastern travels not only a fondness for coffee, but also a Greek woman called Pasqua, whom he had bought in Smyrna, and whom he now employed to serve the cup of coffee in Oriental manner to his guests. The latter, however, soon came in such crowds, to enjoy the beverage or to admire the Greek beauty, that the merchant could endure it no longer; he therefore married the Smyrniote

to his coachman, and advanced them a sufficient sum of money to establish a coffee-house in St. Michael's Alley. The cup of coffee became in England also very soon a universal favorite. Coffee-houses sprang up every where, and were soon the resort of the quidnuncs of the day; and the bean itself was so largely imported that already, under Charles II., a heavy duty could be imposed upon the new article of commerce.

But here also a gentle kind of martyrdom had to lend additional zest to the enjoyment. In 1657 a certain James Farr, who then kept a favorite coffee-house near the Inner Temple, was prosecuted "for making and selling a sort of liquor called coffee, as a great nuisance and prejudice to the neighborhood;" and not more than twenty years later the king himself issued a proclamation to shut up the coffee-houses, because "they are seminaries of sedition." But Charles II., who could defy the Parliament, and look upon the well-earned rights of the people as gracious gifts bestowed upon them out of pure benevolence, who could violate the constitution without scruple, and send those who remonstrated with him to the scaffold—this powerful, overbearing monarch could do nothing against the cup of coffee. When his proclamation appeared the whole city of London was roused to indignation; great tumults ensued, and a revolution was impending. The king rescinded his order, and peace was restored. Such is history.

Very different views, however, were entertained in those days as to the happy effects of coffee from what we now believe. A famous judge, Rumsey, had invented a probang, a horrid instrument made of flexible whalebone, with a small linen or silk button at the end, which was introduced into the stomach to produce the effects of an emetic; and, in order to make it more active, he recommended that, previous to the agreeable inside tickling, a paste of cophie—as he spelled it—with butter, honey, and salad oil, should be made and swallowed. Thereupon a friend writes him as follows: "Touching coffee, I concur with them in opinion who hold it to be that black broth which was used of old in Lacedæmon, whereof the poets sing. Surely it must needs be salutiferous, because so many sagacious and the wittiest sort of nations use it so much. But besides the exsiccant quality it has to dry up the crudities of the stomach, as also to comfort the brain, to fortifie the sight with its steem, and prevent dropsies, gouts, the scurvie, together with the spleen and hypocondriacall windes (all which it doth without any violence or distemper at all), 'tis found already that this coffee-drink has caused a greater sobriety among the nations. For whereas formerly apprentices and clerks, with others, used to take their morning's draught in ale, beer, or wine, which, by the dizziness they cause in

the brain, make many unfit for businesse, they use now to play the good-fellows in this wakefull and civill drinke; therefore that worthy gentleman, Mr. Mudiford, who first introduced the practice hereof to London, deserves much respect of the whole nation."

Germany learned to drink coffee in a manner even more extraordinary. The numerous courts of that happily divided country had been duly initiated in the mysteries of the fashionable drink by their masters, the French; but the custom, being so expensive, had not yet become general. The Elector of Brandenburg, however, a clear-sighted financier, determined to make the new fashion a source of income, and ordered his body-physician, a Dutchman, to write a book on the admirable effects of tobacco and coffee on the health of men. These arguments he not only disseminated largely among his subjects, but enforced also by various rules and regulations, till the obedient Brandenburgers began to drink coffee in large quantities, and filled his empty treasury. An accident led, a few years later, to similar encouragement in Southern Germany. At the siege of Vienna by the largest infidel army that Europe ever saw so near the heart of the Continent, a certain Kolschutski had rendered eminent service as a spy, and when King Sobieski and Charles of Lorraine defeated the Turks, and entered their magnificent camp, they bestowed upon the successful spy the large number of coffee-bags found in the tents. With this treasure he opened the first coffee-house in Vienna, and from that day the cup of coffee has gradually made its way to every province of the great empire, so that it is now found alike in the palace of the monarch and the hut of the laborer. Only in some remoter portions of the East, and in almost inaccessible valleys of the Alps, the beverage has found it more difficult to prevail; and as in England tea is said at first to have been cooked and eaten as a vegetable, the decoction being carefully thrown away, so, some fifty years ago, Alpine herdsmen used to boil the coffee beans with lard till they were soft, and could be eaten like pease.

The new conqueror found, however, its bitter enemies in Germany also. Many physicians warned against it as a dangerous poison, and wrote volume after volume on its sad, pernicious effects on body and soul; ministers found out that coffee was a most powerful temptation of the Evil One, which reduced the strength of the mind by constant excitement, and imperiled the peace of the soul; and the governments of various states assumed the same position, and prohibited the use of coffee. The famous Elector of Hesse, who sold his subjects for so many shillings a pound of flesh to fight for Great Britain on our soil, would not have

coffee sold in his dominions, and as late as 1847 no grocer in the open country dared offer it for sale. Frederick the Great, even, was once entrapped into prohibiting the sale of coffee by others. He wanted to have the monopoly for his own benefit. The Prussians certainly loved and still more feared their Old Fritz, who had made their little land a great kingdom; but when he raised the price of coffee, and his "coffee-sniffers" patrolled the streets of the city to discover the illicit use of the fragrant bean, their loyalty was at an end, and they published caricatures and pasquinades without end. The king looked at them and laughed, and—kept the monopoly. The last enemy of supreme power which the cup of coffee has had to encounter was Napoleon, who determined during the time of the embargo to deprive the whole continent of Europe of its favorite drink. But the great conqueror had met his match, and in spite of millions spent on a strict blockade, and a most painful system of surveillance exercised over high and low, the cup of coffee still held its own, and defied all imperial decrees and *gens-d'armes*.

As the beverage came more and more in demand, inquiries were also made after the plant which produced the bean—a word derived not from our English word bean, but from the Arabic *bon* or *bun*, which is the name of the fruit of the coffee-tree, and so happily coincided with the views entertained by French physicians on the subject that they reasoned that a fruit called *bon*—good—could not possibly be hurtful. Efforts were at once made to acclimate the shrub; but it would not thrive in the severe climate of Europe, and hence it became necessary to cultivate it in distant colonies. The indolent son of the East thought so little of deriving an advantage from this most valuable gift which nature had bestowed upon him that he not only failed to raise it, and to make it an article of export, but to this day allows the more active Western man to provide him, at a great profit, with the product of his own soil. As early as 1650 the industrious Dutch carried the seeds of coffee-trees from Mocha to their rich colony of Batavia, enlarged the enterprise rapidly, and were able in 1719 to appear in the great markets of the world with large supplies of Java coffee. Encouraged by this success, they established similar plantations in Sumatra, Ceylon, and other Sunda islands, which now furnish over two hundred millions of pounds; the French and the English followed their example, and in a short time the coffee-tree had made the voyage round the world. There is a little fragrance of romance connected with the first French effort of this kind, which was made in Martinique. Louis XIV., who, in spite of all his foibles and vices, was fully able to appreciate the importance of such

apparently small matters as a potato tuber or a coffee bean, had in his private gardens a coffee-shrub of five feet height, which before his death (1715) bore ripe fruit. Having heard of German coffee plantations in Surinam, and of Dutch establishments in Berbice, his ambition was aroused, and he desired to have French plantations also in his West India colonies. He intrusted, therefore, a slip from his pet tree to a naval ensign, Des Clieux, with orders to carry it safely to Martinique. Unfortunately the ship on which he served had an unusually long voyage, fierce storms alternating with provoking calms, and at last the water casks were empty. The ensign, however, sacrificed his own wants for the sake of the young plant, and shared with it his scanty ration of water. But his troubles were not at an end when he at last reached the island: storms and tempests, men and beasts, seemed to have united to threaten the tender shoot, and Des Clieux had to place a guard over the plant, who, under his own supervision, watched it by day and by night. Fortunately it grew and thrived, till it became a fine large tree, the ancestor of all the French coffee plantations on the West India Islands. It may safely be said that never was tree more carefully tended, and never more usefully employed.

Another worthy patron of the pretty shrub was the famous burgomaster of Amsterdam, Nicholas Wythsen, who raised young trees in his hot-houses in Holland, and then sent the fruit-bearing plants to Surinam and Africa, and through his friends to almost every portion of the globe. All the West India Islands, as well as South America, soon had their plantations, Arabia its "gardens," as they are called there, and even Madagascar and Ile de France and Bourbon succeeded in entering the lists against the older colonies. The shrub and the fruit have remained nearly the same every where, but the manner of raising the tree differs according to soil and climate.

At home, in Arabia Felix, where the most valued of all varieties, the golden Mocha, is raised, the trees present a strange contrast with the aspect of the landscape farther northward. There a low, sandy shore affords a free view over vast treeless plains which stretch in sad monotony as far as eye can reach, while the cloudless sky sends down an almost unbearable heat. Only here and there a limited pasture, with lean grass and a few graceful palm-trees, breaks the mournful uniformity; in the grateful shade a few Bedouins rest under their black tents, while their brethren hasten on the uncouth dromedary through the yellow desert. Very different is the scene on the southern slope of the great peninsula; for here an abundant, fragrant vegetation unfolds its riches and enchants the senses; incense grows like the juniper of our woods, whole

forests of palm-trees overshadow the lower parts of the mountains, and vast stretches of durra wave like golden grain in the gentle breeze. This is the home of the coffee-tree.

The shrub rises in the form of a pyramid to a height of forty feet; the leaves, resembling those of the laurel of Greece, shine with a dark lustre in the bright sunlight, while lighter hues give life to the beautiful scene whenever the breeze turns up the lower side. During spring a profusion of white blossoms covers the tree with their pure color. They are shaped like those of the jasmine, and break forth from between every leaf and the stem, filling the air far and near with their perfume. Butterflies flutter incessantly around them, for they are rich in honeyed stores; birds fly about; lively, tiny streams murmur at the roots, washing every tree with their welcome waters, and allure at times the shy gazelle that comes running up in timid haste, and anxiously looking around, to slake its thirst. Locusts are chirping on every branch, and a cloudless blue sky looks down upon the exuberant splendor, till the blossoms fade and droop, the winds carry away the light, shriveled leaves, and a small, green button peeps out, which rapidly increases and grows into a scarlet-red berry. After a while these berries become dark violet, but at the same time—thanks to the effects of a tropical climate—the tree produces a second and a third crop of snowy blossoms, so that the beautiful green pyramid is covered with buds and flowers and fruits at every stage of development. When the fruit is ripe, the Arabs spread soft mats under the tree, ascend it, and shake the branches till all the berries have been gathered. They are then spread out on mats for six or eight months, till the fleshy part is completely dried, when a powerful roller passes over them, crushing the hard shell and leaving the two twin beans which each fruit contains to be carefully collected and cleaned. The latter are then still farther dried for some time, being hung up in loosely woven bags, after which they are baled and sent to Beit-el-Fakih, the principal market of Arabia, where over twelve millions of pounds are annually shipped.

As the coffee-tree is the principal source of income for Happy Arabia, it is, of course, most carefully tended and nursed. The coffee gardens are laid out on terraces which rise to a height of 3000 feet, and on each of which there is an artificial pond, with thousands of small canals that irrigate the whole, falling gently from terrace to terrace, to keep the soil always moist. The trees are planted so closely that not a ray of the sun can pierce through the thick shelter of their foliage, and the young plants can grow, thus protected, to supply the places of their short-lived predecessors; for the shrub, which be-

gins to bear fruit in the third year, gives annually from three to five pounds, but declines at the age of twenty-five.

The coffee plantations in Cuba and the West Indies are very different. Here, also, irrigation is all-important, but much easier than in arid Arabia; hence the enchanting gardens are here all on a level, divided into squares with three or four rows of shrubs, and intersected by canals which incessantly feed the thirsty plants. To protect the latter against the immoderate heat of the sun and the frequent tempests of those regions, lofty trees surround the plantations on all sides, and superb avenues of palm-trees pass through them at right angles. In the rear, overshadowed by gigantic banana-trees, stand the huts of the laborers, each of whom attends to a thousand shrubs. The latter are here not allowed to grow higher than about six feet, and the process of drying and preparing the bean for market is both much shorter and more thorough. While Jamaica coffee brings the highest price in England, the taste of other nations is so different that every variety finds a ready market, and what is, perhaps, most remarkable, we are told upon high authority that the worst coffee produced in America will, in from ten to fourteen years, become "as good, and acquire as high a flavor, as the best from Turkey." The fact is that soil and climate determine the quality of raw coffee far more than the mode of collecting and drying it, and that the flavor and quality of the beverage, again, depend almost entirely on the manner of roasting the bean and preparing the infusion.

Nor is the manner of enjoying the cup of coffee less varied in different parts of the world. The son of the Orient, drinking his coffee unmixed, swallows the black but nutritious sediment with the infusion, and consumes at times not less than eighty cups daily. Far out on the burning desert he sits under his black hair tent, silent and motionless, till in the other half of his airy dwelling the Nubian slave has prepared his refreshment. When his pipe and his cup are handed him he leans luxuriously back on his cushions or his bales of goods, casting an indolent glance at the drooping horse, tied to a post before his tent, or the weary camel, crouching on the sand and chewing the cud; but soon his eye becomes animated, his fancy revives, and he thinks of the fate of his beloved ones at home, or he weaves fantastic fairy tales into bright stories and graceful verses. The monotonous noise of the mortar in which, all day long, the small beans of dark yellow color are crushed, so as to furnish an unbroken supply, alone accompanies his thoughts, and fills up the vacant moments by its uniform rhythm. Or he is in Stamboul, the Happy City; a marble-paved court-yard, overshadowed by mulberry-trees

and pomegranates, and freshened and cooled by a merry fountain in the centre, which casts its spray in fitful showers on roses and jasmine; an open staircase leads up to a well-lighted room, with bright-colored hangings on the walls, and richly dyed rugs scattered over the inlaid floor; gold lists, arabesques, and mother-of-pearl in profusion adorn the ceiling; and in pretty niches, behind skillfully carved doors, stand delicate cups and boxes for tobacco. The windows look down upon the cool yard, and a long, low divan with soft cushions runs along the wall. There is no chair, no mirror here; no table and no picture, as in European coffee-houses; but black servants in brilliant costumes walk slowly about, offering chibouk and coffee-cup to every guest. Silently he enters, in silence he smokes his pipe and drinks his cup of coffee, and silently he leaves the house again. A few guests, perhaps, are busy at chess; others may listen to the story-teller on the little platform there with the Persian rug on which he sits, or they gaze with stolid eye at the juggler, who produces from under his thin strip of carpet whatever is asked for by his audience. But no one opens his lips; no one reads a journal; there is no interchange here of thoughts, no making of acquaintances, or forming of friendships. The dreamy, still life of the Orient knows no other enjoyment but listening in silence while smoking and sipping the cup of coffee.

Far more lively is the coffee-house in the noisy cities of Persia. The muezzin has no sooner announced the hour of morning prayer from the balcony of his minaret than fearful sounds are heard floating down the narrow, tortuous streets. They proceed from the keepers of the public baths, who blow their cow-horns to announce that the water for the women's bath is ready. The dogs raise a terrible howl to express their disgust at the hideous sound, donkeys bray in deep gutturals, cocks are crowing in every yard and every garden, and sleep is soon out of question. In an instant the whole city is alive, and tall men in loose trowsers and ample cloaks are seen hurrying from all sides to their favorite coffee-houses. Through a rounded door they enter a court with a fountain, and ascend by a wide, easy staircase to the vaulted hall above, where there is a large number of windows adorned with diminutive pieces of colored glass, and the dazzling whiteness of the walls is relieved by a multitude of leaves and flowers engraved with a chisel, and filled out with blue and gold. Here, also, a fountain plays merrily in the centre; one whole side is taken up with niches, and along the other sides crowd the smokers and drinkers, listening to the songs of Hafiz, the wise sayings of Sadi, or the heroic poems of Firdousi.

How different from the *café de France* or

Italy, where all is splendor and magnificence, while busy, noisy crowds gather there from morn till night! how different from the more silent, almost lugubrious coffee-house of England, where already in the days of the Stuarts affairs of such importance were transacted that Macaulay could compare the regular visitors at these places to the "fourth estate of the realm!" It may well be regretted that coffee-houses are, except in New Orleans, unknown to this country, where the bar, with its fiery drinks and its mixed assemblies, has furnished but a sorry substitute.

We may well ask, in conclusion, what magic power, what irresistible charm there is in the cup of coffee to make it such a universal favorite, and if not a necessity, at least the daily and most cherished drink of a hundred millions of men? Its influence on the well-being of our race and the tendencies of modern culture is enormous, and its effect on social life almost beyond calculation, because, in detail, it escapes observation. It would seem as if all the nations of the earth had instinctively recognized in coffee a benefactor, whose kindness they must acknowledge, though they can not ascertain the precise mode of action. Its sensible effects are too well known to require explanation. It exhilarates, arouses, and keeps awake; it allays hunger to a certain extent, refreshes the weary, and imparts a feeling of comfort and repose. It makes the brain more active, while it soothes the body generally; and, physiologically speaking, it makes the change and waste of matter slower, and thus lessens the demand for food. Strong, black coffee is most active, and may be dangerous, and yet it is a greater favorite with thinkers and all brain-workers. Nervous persons, who are easily excited, people of full habits or of melancholy disposition, ought to avoid the cup of coffee in spite of all its attractions. On the other hand, it has been found invaluable for soldiers upon the march, and even in camp, and especially far superior to brandy in protecting them against fatigue and exposure. Wherever it has become a favorite it has superseded spirituous beverages, and its refining effect is felt as much in the lower classes as its gently stimulating powers are appreciated by the writer and the thinker. If Queen Elizabeth, it has been well said, had taken a cup of coffee in the morning, instead of breakfasting upon half a pound of bacon and a quart of beer, she would have probably felt in a gentler mood all day long, and her unfortunate sister Mary might have been saved the horrors of the scaffold.

Unfortunately the ordinary cup of coffee contains but little of the precious substance, the caffeine, to which all its pleasant and benign influences are attributed by men of science. The adulteration begins in Arabia

already. Dalgrave, the best and most recent authority on that subject, tells us that of the best variety, the Mocha, but little ever leaves Arabia. Even before the bales reach the nearest ports, Alexandria, Jaffa, or Beyrout, they have already been picked again and again. Expert hands inspect it grain by grain, and instead of the hard, round, semi-transparent beans, which alone are fit to make the genuine cup of coffee, only opaque, defective, and whitish beans ever reach the outward-bound vessel. Hence the quality of coffee diminishes with increasing rapidity as the distance becomes greater from Djeiness, and the process of sorting and picking is repeated again and again. In Arabia the Mocha bean holds the first place, next comes the Abyssinian, then the Indian, and, as the worst of all, at the end of the list, the American bean, mainly because of the want of care in gathering the fruit. On the continent of Europe Java is preferred; in this country Rio is probably the favorite with the masses, on account of its stronger aroma.

The adulterations of coffee are so great that pure coffee is rarely to be had except in private families where the head of the house attends in person to the preparation of the precious cup. The admixture of foreign elements is, however, not always fraudulent. The great Liebig tells an anecdote from his own experience on this subject. He was drinking coffee at a country house, and found the taste so unpleasant that he proposed to the lady of the house, half in earnest and half in jest, to spread a pound of her coffee on a sheet of paper, and to employ all the guests in examining it in detail. This was done, and the result was that four ounces were found to be foreign matter, and some of this of the most objectionable nature. The coffee came from Brazil, where the birds are allowed unhindered access to the drying fruit, and no sorting takes place afterward. It is different in railway refreshment-rooms and on board of steamboats. Here no effort is made at all to furnish coffee. The so-called coffee extract, which is almost universally in use in these places, contains nothing but caramel—burned sugar. A small lump of this shiny black substance is put into a cupful of hot water, stirred, dissolved, and then handed across the counter!

Poverty, or such necessity as wars and blockades may engender, lead to the partial use of substitutes, which are numerous enough, as all that is required is an aromatic and a bitter principle. The Germans drink enormous quantities of coffee made from acorns, and like it; and the roasted seeds of the water-iris are said to approach very near to coffee in quality. Beans and rye and wheat, as well as corn and sweet-potatoes, were largely used in the South during the late war. Dried roots, such as turnips and carrots, also are often employed;

but of all these substitutes chiccory has become such a favorite that it is hardly any longer to be looked upon as an adulteration, being demanded by the consumer, who prefers it, as an admixture, to pure coffee. This chiccory is a wild endive, which is now extensively cultivated in France, Belgium, and Germany, and certain portions of England; it is also imported in vast quantities into this country. Its original merits were simply the dark color and the bitter taste it imparted to coffee. The public taste seems to have most readily accommodated itself to the addition of chiccory, which was at first a fraudulent practice. The mixture became gradually pleasing to the palate by mere force of habit, and now some hundred millions of pounds of the dried root are annually consumed. Mr. Johnston, however, adds some features to this adulteration of coffee which are not quite so harmless. "The coffee-dealer," he says, "adulterates his coffee with chiccory to increase his profits; the chiccory-maker adulterates his chiccory with Venetian red to please the eye of the coffee-dealer; and, lastly, the Venetian red manufacturer grinds up his color with brick-dust, that by his greater cheapness, and the variety of shades he offers, he may secure the patronage of the trade in chiccory." Certainly happy is the man who can be quite sure after this that he enjoys in reality a cup of coffee! He may be quite willing to admit its dangerous character, with Voltaire, who said, "It is poison, certainly, but a slow poison: it has been killing me these eighty-four years!"

THE SNOW-BIRD.

A COLD, wintry day (altogether *too* cold for so early in the season, people sagely said it was) was drawing toward nightfall, and hurrying clouds and sharp, driving winds foretold a still more tempestuous night, when, as Dr. Grafton, having made his round of professional visits, turned into his office entry, he found awaiting him a note containing these words:

"Will Dr. Grafton call upon Mrs. Vaughan at No. 47 — Hotel as soon as convenient, and see a sick person, a stranger in the city?"

The handwriting was that of a lady, and the confidence thus reposed in him by a stranger was flattering; and the tired doctor, adding a few more wraps to defend himself from the increasing cold, sallied forth, and turned wearily back upon this new mission.

It was a long walk, for the hotel indicated was at the opposite end of the city, and the streets were already white with the first snow of the season.

Reaching the hotel, he was shown, at his request, to No. 47, where he was met by an elegant woman of middle age, who received

him with ease, and introduced herself as the writer of the note.

"We are traveling, Dr. Grafton," she said, "and my daughter having become alarmingly ill, we have had to make a longer stay here than we had intended; and thinking it necessary to call in medical aid, I have been advised to send for you." The doctor bowed silently, and the lady went on:

"My daughter is, I fear, threatened with fever. She is of a nervous temperament, has met with severe family bereavements, and is very excitable; indeed, she had a brain fever some eighteen months ago, and I am sadly apprehensive of a recurrence of it. I have thought it best to tell you this in advance, as you will find her nervous system is very much unstrung. But you can form your own judgment better when you have seen her. Will you follow me, if you please?"

Crossing an intermediate passage, the lady led the way into the sick-room. The apartment was so dark that at first the doctor could see only that a respectable-looking sick-nurse glided from her post of duty by the invalid's pillow. But Mrs. Vaughan noiselessly approached the window, and drawing back the curtain, let a little light fall upon the bed, disclosing a young and handsome female, who, with wildly uptossed arms, disheveled hair, flushed cheeks, and quick, gasping breath, was sleeping the uneasy, broken slumber of fever or delirium.

"Bertha, my child," said the elder lady, bending tenderly over the sleeper—"Bertha, my daughter!" The sleeper started up with a low moan of pain, and opened her eyes with a wild, frightened gaze upon the doctor.

"This is the doctor, dearest," said Mrs. Vaughan, soothingly. "Don't you know I promised to send for him? This is Dr. Grafton, Bertha."

"Can he do any thing for me?" murmured the patient, laying her white hand, as she spoke, upon her brow, from which the loose curls had been carelessly brushed back.

"Is the pain in your head very severe?" asked the doctor, soothingly.

"Torturing!" sighed the invalid, briefly.

Dr. Grafton took the seat the mother had moved toward him, lifted the hand of the patient tenderly from her burning temples, and laid his own cool one in its place, while he laid the fingers of his other hand lightly upon her wrist. For a moment she was quiet, as if the steady pressure of his hand upon her brow was mesmeric. Then suddenly springing up, she dashed his hand aside, and fixing her wild eyes upon his face, "Doctor, doctor," she said, excitedly, "can you help me? Can you give me any thing to strengthen me? I *must* get up! I *can not* lie here; I have business that *must* be attended to, and they will not let me go. Can you give me bark, wine, opium, brandy—*any*

thing, any thing, to give me strength? I *must* get up: I must go to the Exhibition. I *must*—I *will*!"

"Hush, Bertha darling," said the mother, soothingly: "you shall go as soon as you are able to."

The sick woman snatched herself away from her mother's hands with the quick irritation and fictitious strength of fever.

"You have been telling me that for a week and more," she said, bitterly, "and you will not let me go. Oh! doctor, doctor!"—and she caught the doctor's hands in both her own—"you look good and kind and sensible: will you help me? Oh! if you knew how much depends upon it, you *would* help me if you *could*—I am sure you would."

"I think I can help you decidedly," said the doctor, cheerily. "But I always expect my patients to do as I say. If you want me to cure you up *quick*, you must lie down and take a composing draught that I shall give you, and try to sleep; that's the only way to do, and then you can go out just when you want to."

A look of gratitude and hope passed over the beautiful features of the invalid. "I will do just what you tell me to," she said, as she lay wearily back upon her pillows. "There, mother! See, the doctor says I may go out."

In a few moments the composing draught was mixed and given, a cooling wash to bathe the flushed cheeks and beating temples was prepared, and the medicine for the night, and careful directions to the nurse had been given.

"I shall look in upon you again in the morning," said the doctor, encouragingly; "and if you only mind my directions, I am sure to find you better." And the patient smiled drowsily as she held out her hand to him.

"What do you think of her, doctor?" asked the mother, eagerly, when they had returned to the sitting-room. "Is she—very ill?"

"No, I think *not*," said the doctor, reflectively. "She is a stranger to me, you know, and of course I can not form so correct a judgment of the case as if I knew my patient better. She is, as you say, evidently laboring under strong mental excitement. I should judge that her powers of mind and body had both been overstrained to a great degree. If I can reduce this excitement, I do not apprehend much from the feverishness. I think that is probably the *result*, not the *cause* of the excitement; but I can form a better opinion in the morning. Keep her very quiet. Do not let her talk if you can help it; but, above all things, do not rouse her by opposition. I have given her a strong opiate, and if she sleeps, as I think she will, I trust to find her much better in the morning;" and, shaking hands with the

relieved mother, Dr. Grafton bowed himself away.

Night had gathered in with storm and darkness when the doctor emerged into the street again, and, tired and cold and hungry, he decided not to return to his office, but to go directly to his home, which was a well-managed, comfortable bachelor establishment. It was dark and intensely cold; the wind was howling furiously—a fierce north-east wintry wind, that seemed to chill the very marrow in his bones; and he was half blinded by the sharp, cutting sleet and stifling snow that drifted into his face and eyes, and almost choked his very breath, as, stumbling, plunging, floundering on, he made his slow, uncertain way through the streets.

"Thank Heaven!" he said, as he reached his own home, and, panting and breathless, mounted the steps and pulled open with strong hand the outer vestibule door, already obstructed by the fast-gathering burden of drifted snow heaped against it. "I don't think I could have walked half a mile farther without losing my breath."

As, latch-key in hand, he rapidly mounted the inner steps, thankful for even the shelter thus afforded him from the grim night and lashing wind, he saw by the dim, flickering light of the wind-shaken street lamp behind him a dark, shapeless bundle lying upon one of the upper steps, and half unconsciously, in his haste to enter, the doctor gave the bundle a slight push out of the way with his foot. Good gracious! it moved, it wriggled! It was *alive*!

"Oh, thunder!" said the astonished doctor: "here's a pretty to do! A stray baby left at my door! There, it's come at last! I've been dreading it; I knew it *would*; I've been expecting it ever since I went to house-keeping. And now what's to be done? What comes next, I wonder? Turn out in all this tempest and hunt up a wet-nurse for the 'interesting stranger,' I suppose. I'll be hanged if I do. Lord! I'm wet enough to fill the office myself, if that was all (I should say it would be hard to find a *dry* one to-night). And *then*? Well, *then* come coral and bells, silver mug, and knife, fork, and spoon in prospective, I suppose: agreeable prospect for a snug, single gentleman not yet forty-five, certainly! But first let us see who and what it is—he or she, *black* or *white*. Come now, my young friend, own up, *what are you*?" And as he spoke the doctor stooped down and laid his hand lightly upon the bundle. Only a mass of long, loose, wet hair met his touch.

"Bless my soul! By all that's good, only a *dog*, after all!" said the doctor, laughing, but slightly recoiling, for he did not very much fancy the canine race. "More frightened than hurt that time, Dr. Grafton, at all events. Silver mug and coral and bells in-

definitely postponed, I should say. But, now, what am I to do with the dog? Poor fellow! it seems inhuman to turn even a dog out into such a night as this; and if I let him stay, he'll be sure to bark or howl. I wonder would he bite if I should just stir him up a little? Here, hist, you Towzer! Jowler! Bose! Tiger! whoever you are—st! st!" And as he spoke, the doctor cautiously (for he had a wholesome dread of hydrophobia on his mind) poked the intruder slightly with the point of his umbrella.

But, instead of the bark or growl, for which the doctor stood prepared, came the unexpected response, "You get out! What you 'bout? Let a fellow alone, can't you?"

The doctor nearly jumped backward down the steps in his astonishment. Then, dextrously grasping the unknown with a firm grip in one hand, he flung open the door with the other, and springing into the entry, closed the door, and dropped his burden upon the entry mat, under the full blaze of the hall gas.

A confused mass of wet rags, of no particular color or shape, and involved in them, in some strange, inexplicable way, rather than clothed by them, a child—a boy of *possibly* eight years of age—but such a very *mite*, so small, so emaciated, so pinched and starved and thin and shrunken, he might have well passed for five or six at the most.

As Dr. Grafton set him down right side up on the mat (for he had brought him in in a very *promiscuous* way), the bright gas-light seemed to awaken him at once, and thoroughly. And tossing back his wet hair, and lifting his eyebrows with strange, comic action, he darted a quick glance at his captor from a pair of bright dark eyes, that seemed preternaturally large and sharp in his little peaked face—a glance of mingled intelligence and bravado; and placing his hands upon his hips, stood watchful, still, and silent.

"Well!" said the doctor, waiting for him to speak.

And "Well, Sir!" retorted the unknown, with perfect *sang-froid*.

"What were you doing on my door-step, Sir?" said the doctor. "What business had you to be there?"

"Tain't an indictable offense, I tell you now," said the child, speaking with marvelous quickness, and hitching himself together as he spoke. "Simple trespass; you can't recover; action won't lie, I tell you."

This jargon of legal opinion, coming as it did from such baby lips, and given in a sharp, incisive voice, was too much for the doctor's gravity, and he laughed aloud.

"What the devil are you?" he said, hastily. The boy saw his advantage, and improved it.

"I wouldn't swear, governor," he said, with a comic air of grave rebuke. And again the eyebrows went up, and the corners of the

small mouth drew down with that strangely grotesque action. "I wouldn't swear if *I was you*; it is not gentlemanly."

"I agree with you fully," said Dr. Grafton; "it is not. But tell me, if you please, *what are you*?"

"Am I not a man and a brother?" said the mite, striking an attitude, and gravely contemplating his questioner with searching glances.

"Can't see it, for the life of me!" said the doctor. "And, pray, *who are you*?"

"I don't know, Sir."

"You don't? Well, that's singular, anyhow. I suppose you've got a name, have not you?"

"Something of that sort, Sir," said the child.

"Well, let me hear it; what is it?" The boy hesitated. "What is it, child?"

"You have not told me what *yours* is yet; and it would be good manners to let you speak first."

"Oh! is that it? Very well, then: mine is Percy Grafton—Dr. Grafton. Did you ever hear it before?"

"No," said the boy, reflectively; "I don't know that I ever did."

"And now yours?"

"Oh! mine has not got any such nice handle to it as yours has; it's Franco."

"Frankie?" said the doctor—"Frankie *what*?"

"No, Sir! not Frankie—Franco," said the boy, gravely.

"Ah, well, much the same; Franco *what*?"

Again the child hesitated, and then said, timidly, "Franco Sturdevant."

By this time the doctor had thrown off his great-coat, many wraps, and overshoes; and, opening the door of his sitting-room, motioned the child to enter. The shivering, half-clad little stranger glanced into the lighted room, saw the brightly burning fire, and, with a cry like a famished hound, he sprung toward it, dropped on his knees before it, laughed aloud, and, spreading out his little thin arms as if to take in its warmth more completely, he seemed to give himself up to the enjoyment of the passing moment.

For a little while there was silence. Dr. Grafton, leaning his elbow upon the mantel-piece, stood watching the steaming, shivering little creature, the cavernous hollows of whose pallid cheeks seemed even more conspicuous in the strong gleam of the fire-light; the child, with his unnaturally bright eyes fixed, as in a sort of mute worship, upon the leaping, ruddy blaze; then, as the shivers and the steam grew less and less, the boy looked up.

"What are you going to do to me, Sir?" he asked, suddenly.

"Warm you and dry you first, and then give you some supper," said Dr. Grafton.

"You don't say so! That's nice! But,

doctor, stop a minute: I haven't got a five-cent bit!"

"Well, what of that? When I invite 'a man and a brother' to sup with me, I do not expect him to pay for his supper."

"Oh, of course not," said the boy. "And do you mean that you will stand treat for me?"

"I do. Are you hungry?"

"Awful!" said the small stranger, significantly laying his little skeleton hand upon a certain concavity, which should have been a convexity. "But it seems too good to be true. Doctor! you—you—?" He hesitated.

"Speak out," said the doctor; "what is it?"

"Well, then, you see, all this is very nice, you know; but I hope you do not mean to finish off by making an atomy of me, such as you gentlemen keep in your closets, do you?" And as he spoke he rose to his feet, dropped his hands, with the fingers hanging loosely at his sides, bent his head forward, let his under-jaw fall, and standing with loose-jointed, knock-kneed limbs and expressionless face, with quick, effective, inimitable art, he represented a prepared skeleton.

"Lord bless you, child, no!" said his host, laughing. "You are only too much like that already."

"All right," said the little mimic, springing into life and action in a moment. "You will excuse me, Sir; only I thought I would just give you a hint that that sort of thing would not be agreeable to me. And now when is that supper you were talking about likely to come off?"

"At once," said the doctor, ringing the bell as he spoke. "Tell Mrs. Jones," he said, "to send up supper for *two* as quickly as she can; and tell her not to spare for plenty of hot toast, bread and butter, and cold meat."

"And pickles?" suggested the stranger, in modest tones.

"And pickles," repeated the amused host. "Is there any thing else you would like to suggest?"

"Something hot to drink would be nice; don't you think so?"

"*To drink*—of what sort?" apprehensively questioned the doctor, rather "taken aback" by the last proposition.

"Oh, tea—or coffee—or shells—which-ever *you* like. I am not particular, *if it is only hot*," said the child, calmly, but still shivering from head to foot.

"Oh yes! plenty of hot tea, of course," said the doctor, much relieved; and the servant withdrew.

"That's bully!" said the boy, drawing nearer to the fire again.

The doctor opened the door into an adjoining closet, and came back with a large, thick, tweed shawl and a woolen scarf. "Suppose," he said, "you take off the wet-

test of your clothes, and wrap yourself up in these."

The boy obeyed instantly. But as he drew off his miserable rags piecemeal the doctor looked and shuddered at his extreme emaciation. The hollow chest; the hatchet-like shoulder-blades; the ghastly protruding ribs and collar-bones; the skeleton arms, scarce larger than those of a new-born child, but with the joints standing out in knotty projection. Only in the dissecting-room—never on any *living* subject—had his professional eyes rested upon such limbs before.

In a few moments the supper was sent up, and the strangely assorted pair sat down to it together. The doctor helped his guest at once and bountifully, fully expecting to see him fall upon his food like some ravenous beast of prey; but, to his astonishment, the boy, though evidently famished, ate with avidity, but with perfect propriety, recognizing all the little conventionalities of the table, and eating with evident relish, but without greediness or rude haste.

"When did you dine, my boy?" asked the doctor, as the child drew back his plate, declining any farther supplies.

"I had a handful of pea-nuts at noon," said the boy, quietly.

"And what else?"

"Nothing else to-day, Sir."

"Good Heavens! Is it possible?" said the doctor. "*A handful of pea-nuts* on such a day as this?"

The boy smiled, lifted his thin shoulders in quiet, expressive shrug, but said nothing.

"Now tell me, child," said Dr. Grafton, as they left the table and returned to the fire, the doctor lighting his cigar to dispel the not overagreeable steam from the boy's wet clothing—"Oh, by-the-way, you don't mind a cigar, do you?"

"Not in the least," said the boy, gravely. "I never smoke *myself*, but I rather like it than otherwise." And again came that strange, quick contortion of lip and brow, which had already caught the observant eye of the doctor.

"I have certainly seen that look before, but *where*?" questioned the doctor, mentally. "I am *sure* I have seen it. I can not fix it, but I know he looks like some one I have seen before; but *when*, and *where*, I am sure I can not tell; the likeness evades as much as it puzzles me."

"Now, then, my young man," he began again, when he had seated himself in his own especial fire-side chair, and his cigar was drawing just as it should do, while his diminutive guest sat perched upon another chair, dangling his purple drumsticks of legs, and holding out his little red feet to the genial warmth—"now, then, I want to know something about you; and, in the first place, what were you going to do in my vestibule? Tell me the truth."

"Sleep there," said the boy, quietly. "That was all."

"Sleep there? What! all night, do you mean?—on those stone steps this bitter night! Why, child, you might have frozen to death before morning."

"Oh no, I guess not," answered the boy, calmly; "there was a mat under me, and it seemed real cozy. I did not feel *so very* cold."

"But why in the world did you not go home?"

The child looked at him wonderingly for a moment, as if doubtful if he had heard the question rightly; then, lifting his facile brows with a quick grimace, answered gravely, "I did not know the way, Sir."

"Then why not ask a policeman to take you home?" questioned the gentleman.

"Policemen are not overfond of boys, as a general thing; and, besides," he said, with another strange facial contortion, "I couldn't give him my address; I hadn't my cards about me."

"Do you mean that you had no home to go to?"

"Something considerably like it, Sir."

"And where do you sleep generally?"

"Where I can, Sir; out-of-doors in summer, but the nights are getting *rather chill* now." Another grimace and shrug of the shoulders.

"Tell me how you live. Have you no father?"

"No," said the boy; "entirely out of that article; never had any on hand that I know of."

"Nor mother either?"

The little fellow's bright dark eyes were suddenly filled with tears, and his mocking voice choked and grew tender, as he faltered out, "I do not know, Sir."

"You do not know?" questioned the doctor, sternly.

"No, Sir; I *don't* know, indeed. I never had a father, but I *did* have a mother and a home *once*; but I have lost them both!"

"Lost them; in what way? Tell me."

"But I can't tell you, Sir, for I do not know it myself. I only know that I *did* have them *once*, and I *have got nothing now*."

"That is very strange, certainly," said the doctor. "Tell me about your mother, then. What was *she* like?"

"Oh, mamma? she was *quality*!" said the boy, drawing himself up proudly. "I did not know it *then*; but I know it *now*."

"And how do you know it?"

"Oh, because I see such women get out of the carriages at Stewart's door every day, and the boys say they are the *quality folks*;" and as he spoke the boy slipped from his chair, drew the thick shawl around him with one hand, and gathering up its long, trailing folds gracefully behind him with the other, with head erect, and dignified but gliding steps, he crossed the room in life-like

imitation of the air and manner of a well-dressed, stylish woman who "carries herself delicately," as did Queen Esther. "But mamma never comes to Stewart's," he said, sadly, as he returned to his seat with drooping head and tearful eyes; "I have watched for her there for hours and hours, but—she never comes!"

"Poor little fellow!" said the kindly doctor, touched by the real pathos of the child's look and voice. "Tell me all that you can remember about your mother and your home, and possibly I may help you to find them."

"Yes, Sir: there was mamma, and grandma, and old Ponto, and the rocking-horse, and I; there was not any body else that I remember, but the servants."

"Yes, but how came you to leave them?"

"I don't know. I was up in the nursery eating my supper out of my new silver bowl that grandma gave me on my birthday, and mamma came up all dressed to go out to ride; and she took me up in her lap and kissed me ever and ever so many times, and she cried—poor mamma! she used to cry a great deal; and she said she was going out to ride, and she told nurse not to leave me alone after I went to sleep, but to sit with me till she came home; and nurse said she would, but she didn't; for after mamma and grandma had gone in the carriage, and I saw them go, she said she was going down to have her tea, and she told me to keep very still and she'd soon be back; but she was gone, oh, ever so long! and I got tired and fell asleep; and then I thought nurse came and took me up and put me into bed; and the next I knew I was cold, and I waked up, and somebody had me in their arms and was running very fast, and I was frightened, and began to cry; and the man that had got me squeezed me tight, and shook me, and told me to stop that or he'd be the death of me; and so I stopped it. And he ran very fast a good ways, and then we came to a railroad, I guess it was, for there were lights, and some cars standing there, and he carried me into the car and set me down *hard* in a seat up in the corner, and told me not to speak or move till he came back with the tickets, for if I did he'd cut my ears off. And in a minute the cars began to move, and then they stopped again, and then the people made a great cry, and came running up with lanterns, and I heard them say somebody was killed—had both his legs cut off!" said the child, shuddering, his pallid face growing, if possible, a shade more colorless at the terrible recollection.

"Oh, I saw the blood! and they talked and talked of it till it made me sick; and then at last the cars went on, and the cross man did not come again. I was glad of *that*; and I was so tired and frightened I crept down under the seat, where nobody could see me, and then I fell asleep, for it

was dark night, and mamma always had me put to bed at seven. And the next I knew it was morning, and the cars were empty, and one of the sweepers pulled me out from under the seat and told me to go about my business, for I had no right to get into the cars to sleep, he said, and they *won't* let boys do that, you know. Well, it was here in New York, and I kept hid for some time for fear the bad man would catch me; but he never came again. And when I got hungry I *cried*, because I was not used to it *then*, and I was only a *little fellow then*; and a big boy met me, and he said he'd feed me if I would sell pond-lilies for him; and I did. All the boys were very good to me, and I sold pond-lilies, and berries, and papers, and matches, and candies, and oh! ever so many things for them. They said folks—women folks—always bought of me because I was so little. And then this last summer I was office-boy to a lawyer—that *was prime!*" He spoke with a full sense of the dignity of this last position.

"You do not happen to want an office-boy, do you, Sir?"

"Yes, perhaps I do," said Dr. Grafton, won to pity the desolate crumb of humanity thus washed to his very door-steps. "But we will talk of this in the morning. I see you are sleepy now—aren't you? Don't you want to go to bed?"

"Yes, Sir," said the child, rising; "I do. May I go out into the porch, if you please?"

"No," said the doctor, gravely; "I can not let you sleep in my porch any more." The boy's face fell. "But I can fix you up a little bed in this warm room. I think, with some of the sofa-pillows and a thick rug, you could do for one night, couldn't you?"

"Lord bless you, Sir! I *guess* I could. Don't you take that trouble. I can sleep any where round on the floor, if you are only willing." And curling himself up in the corner of the room, like a dog or cat, the poor little waif was soon lost in the calm, deep slumber of youth and innocence.

When the doctor opened his eyes the next morning he found the boy seated at the foot of his bed, with his great dark eyes fixed full upon his face.

"Good-morning, Sir," he said. "I hope you have slept as well as I have?"

"You could not have slept better," said his host.

"All right, then, Sir. See, I have got all your things in order for you. Very nice rooms these are of yours; every thing is so convenient. I have had a capital warm bath, and feel all the better for it. Want water to shave, Sir? Well, I couldn't find your razors; but it was no great matter for *me*, for I did not intend to shave to-day *myself!*"

"Ridiculous monkey!" said the doctor, laughing; but he saw that the child's face

and hands were clean and shining, and that his loose hair had been washed and rubbed till it was a mass of burnished curls.

"Do you take a morning paper, Sir? I will take it in, and dry it for you, while you dress." And he was out of the room in a moment.

When the doctor rose he found his clothing nicely brushed, and neatly arranged on a chair at his bedside. The bath-room, if it had been used, was left in perfect order; even clean napkins hung on the napkin-stand for his use; and, best of all, the sanctity of his combs and brushes had not been invaded. This was a degree of refined forbearance for which he felt particularly grateful.

After a plentiful breakfast the doctor held a short consultation with his new inmate, proposing to keep and feed him for the present (if he behaved well), and promising in the mean time to set on foot inquiries for the child's mother, in return for which the delighted and grateful boy offered his earnest services as office and errand boy.

"I can sweep the office," he said, "and dust the books, and tend the fire, and run of errands, and answer the door, and tell you who calls when you are out."

"I don't know how you can do that," said the doctor, as the boy pressed his eager offer of his services. "Can you write down the names of the people who call?"

"No," said Franco. "But can't I remember? or can't I have a slate, and ask them to write down their names and streets themselves?"

"But what if *they* can not write themselves?"

"Then," said little Franco, with cool, practical shrewdness, "I don't think *they* would be *paying patients*, and their custom would not be much of a loss to us."

This compact made, the doctor went out, bidding the boy to follow him; and taking him to a ready-made clothing establishment, fitted him to a whole new suit, plain and serviceable, from cap to shoes.

"Not more costly than the silver mug and coral and bells," said Dr. Grafton to himself, as he paid the bill, and looked with pleasure upon the work of his hands. Then taking the boy to his office, he installed him there, and left him to his own devices, while he made his professional calls.

The doctor felt strongly tempted at once to visit the beautiful and interesting patient to whom he had been summoned the night before; but wisely concluding she would not be ready to see him at a very early hour, he decided to visit some of his less stylish patients first; and the result proved he was right; for when he reached the hotel Mrs. Vaughan received him, requesting him to wait with her a few moments, as her daughter was rising.

"She has had a much more quiet night, doctor," she said, "and is decidedly better to-day."

"Is she less excited than she was?" asked Dr. Grafton.

"Yes, I think so, but very nervous and excitable still; very anxious to go out."

"What is it that she wants to do?"

"I will tell you," said the lady. "If I give you some outline of my daughter's sad history, you may, perhaps, be better enabled to form a judgment of her case."

"As you please," said the doctor, bowing; and the lady went on.

"About ten years ago my daughter, who is, as you see, still young, met, while at a watering-place, with Garcelon, the comedian. You have seen him, doubtless; for at one time he was the rage."

"I have seen him repeatedly," said Dr. Grafton, smiling involuntarily as he recalled the inimitable drollery of the once popular favorite of the stage.

"You know, then, how wonderful his imitative art was?"

"Certainly; I never saw it equaled."

"Then perhaps you will not wonder when I tell you that, assuming with masterly art the rôle of a perfect gentleman, he won the affections of my beautiful, young, and inexperienced child.

"She had wealth, and he kept up the deception until she had married him; *then* he threw off the mask, and stood revealed in all his native meanness and habitual profligacy; and from that time our lives were made miserable by his exactions and excesses, for my daughter had no father or brother to protect her.

"They had two beautiful children, but the youngest fell a victim to his father's violence and obstinacy; the child was threatened with croup, and Garcelon, scoffing at our fears, persisted in taking him out to ride, and the little one died the next day. Beneath this heavy blow my poor child's health and reason reeled, and, half frantic with her grief, she accused her husband of being the murderer of her child; and from that moment he was her bitter and implacable enemy.

"At last an appeal to the law freed her from him; they were divorced, and soon after he was killed by an accident on the railroad. Blessed as this release was to us all, you can understand how its awful suddenness shocked and excited her; and the loss of her other and only child about the same time brought on, as I have told you, a brain fever; it is a return of this that I so much dread; all this restlessness and wild excitement seem to me the sure precursors of it."

"It is a sad story," said the doctor, sympathizingly. "But I think opposition of her wishes and constraint upon her actions are the worst things for her. What is it she wants to do? Where does she so much wish

to go? I think she spoke of some review—some exhibition. Would it not be practical to indulge her by taking her there?"

"No," said the mother, sadly. "It would involve too much fatigue and exposure. You did not understand: it is the annual exhibition of the reform school she so much wishes to be present at."

"What sort of interest can *that* have for her?"

"Oh, it is in the hope to find her lost child; she goes every where where pauper boys are."

"Can she not be made to realize that the child is dead?"

"But we do not know that he *is* dead, Sir. Ah! I forgot you didn't know the circumstances. I sometimes think all this trouble has affected my own memory. At the time of the divorce the child, by the decree of the court, was given to the mother, but Garcelon threatened to take it from her in revenge. Of course it was only a threat, as he had run through all the property he could lay his hands upon; and the child, whom he never loved, would have been a heavy burden to him in his low, wandering, dissolute life. Still the threat kept her in constant terror. At last she received a letter from him, stating he would be glad to leave the country, but was without the means, and if she would meet him that night at a place which he named, about ten miles from us, and bring him a certain amount of money, he would never trouble her again."

"She went. I went with her, taking her uncle Sturdevant, who had been her legal counsel, with us as a protection. But Garcelon was not there. We waited for him two hours, and as he failed to come, we returned home; but only to new trouble. The child had been taken from his nursery (whether by the complicity or carelessness of his nurse we never knew) and carried away. At first, of course, our suspicions fell upon the miserable father, but we learned the next day that he had been killed that very night upon a cross railroad, probably on his way to keep his appointment with us. There, in that *one* instance, I suppose we had done him wrong."

"This new and 'overwhelming blow, together with the terrible circumstances of Garcelon's frightful death, threw my afflicted child into a brain fever, as I have already told you. Since her recovery we have journeyed every where in search of the lost child, but no trace of our poor little Franco has ever been discovered."

"Franco!" said the doctor, whose fast-growing suspicions this name seemed almost to confirm. "Is not that a peculiar abbreviation for Francis?"

"The child's name was not Francis," said the lady. "Garcelon's name was Francisco."

At this moment Mrs. Garcelon's nurse sum-

moned them; and not daring to disclose the hope that was growing into conviction until it ceased to be a doubt, the doctor said, kindly, "I am deeply interested in this sad story of yours; but I will only repeat to you the advice I have already given: keep up your own spirits, and try to keep up your daughter's."

"I confess I have taken an opposite course," said Mrs. Vaughan. "Feeling more and more the uselessness of our search, I have tried by every discouragement to prepare her for what I felt *must* be the final disappointment."

"All wrong, madam," said Dr. Grafton. "Excuse me; but don't you *know* if it were not for hope the heart would break?"

They went into the patient's chamber, and found her sitting up, and much more composed than on the previous night, though still evidently very weak.

"Why, you look a great deal better," said the doctor, encouragingly, after he had received the nurse's report of the patient's night. "You are doing bravely. Only keep on as you are doing now, and you will soon be off the sick-list. You have very little fever."

"But, doctor," said the patient, anxiously, "how soon do you think I may ride out?"

"Possibly *to-morrow*, if it is fine," said the doctor, cheerfully. "Your mother has been telling me of the object of your search," he said, boldly; "and who knows if I may not be able to help you? We doctors know all sorts of persons, and go to all sorts of places."

"Oh, doctor!" said the invalid, "do you think there is any chance?"

"Every chance in the world, madam, if you will only control yourself, and keep up your spirits. I will call in again in the course of an hour, and bring you a new medicine that I am almost sure will do you good; and then, when you are stronger, I will take you all over the city, if you wish. As a medical man, and one of the 'Board of Health,' I have the entry to nearly all our public institutions. Only keep yourself quiet and get well, and you shall see what we can do."

"Oh, doctor," said the patient, her delicate cheek flushing as she spoke, "you have given me new hope, and that to me is new life. Bless you! bless you for this encouragement!"

"Wait till you have tried my new medicine," said the doctor, cordially grasping her extended hand in his. "And now good-morning."

It is needless to say the sympathizing doctor made "a quick passage homeward-bound" to his office, where he found little Franco gravely ensconced as office-boy, the present duty seeming to consist of sitting on a high stool and doing nothing.

"Nice set of instruments you've got, Sir,"

he said, gravely. "I think I'd like to be a doctor myself. I know the use of *some* of these tools already. This is to pull out teeth with; I tried it on one of mine, but it hurt me, and I concluded not to use it. But I think I would not much mind pulling out a cat's teeth. I *hate* cats. Do any cats ever come here to have their teeth pulled out? If they should, you let *me try*, won't you? I think I could do the job—that is, you know, if the cat wanted me to. Don't you think I could, Sir?"

And as the child spoke the doctor recognized in his strange manner and expression a strong likeness to Garcelon, the comedian, mimic, and buffoon of the stage. *That* was the likeness which had so puzzled and evaded him.

"Get your cap, Franco; I am going to take you out with me." And in a moment more they were in the streets again. The doctor stopped at a drug-store and had some simple tonic put up, to serve as an excuse in case his hopes had misled him, then hurried

on at a pace that taxed even Franco's young and agile limbs.

"If you please, is any body going to die, Sir?" questioned the breathless boy, in wonder at their rapid pace.

The doctor was calculating the risk to his patient of a too sudden revulsion of feeling, and answered, "No, my boy; joy seldom kills"—an answer over which the child pondered in meditative silence.

They reached the hotel, and, mounting the stairs unannounced, the doctor made his way to the sick-room. With beating heart he gave the professional tap. The nurse opened the door to him.

"It is Dr. Grafton, Mrs. Garcelon." And the doctor, holding the child fast by the hand, walked in and stood before her.

He heard the cries, "My Franco!" "Mamma!" saw that the patient did not faint, and then hurried into the parlor to send in Mrs. Vaughan.

Dr. Grafton's *new medicine* had worked like a charm.

IS ALASKA A PAYING INVESTMENT?

By W. H. DALL.

THREE years have elapsed since the United States purchased the territories of Russia in America. The acquisition of the region now known as Alaska was eminently an act of faith; and of faith not so much in the resources of that *terra incognita* then put down on the maps as Russian America, as in the judgment and clear-sightedness of the two well-known statesmen who were most prominent in recommending the measure. The subject of the present inquiry is—How far has that faith been justified by the results?

Whatever may be the individual opinion of any one in regard to the policy of annexation in general, there can be no doubt that the feelings of a majority of the citizens of the United States are in favor of it, however much they may be modified with regard to any special case. This is a subject into which I do not propose to enter in this article.

With regard to Alaska, it is evident that the ideas most prevalent of late are that the Territory is worthless, or nearly so, and that the purchase was for us a bad bargain. This feeling is in great part, if not entirely, due to a succession of unfavorable reports, emanating from various sources, to which more or less importance and reliability have been attached. Personal familiarity with a large portion of the Territory has led me to give little weight to these documents, knowing, as I do, that most of them have proceeded from interested sources, and contain, adroitly mixed with a few grains of truth, an immense mass of crude error, prejudice, and

ignorance. But the public at large, having no means of weighing and discriminating between the various conflicting statements, has been forced to accept the views of the unfavorable majority, or to give up the attempt to comprehend or decide upon the matter.

It has seemed, therefore, desirable that the facts of the case should be clearly and succinctly stated, reduced as far as possible to the form of figures, which, at least, are not open to any charge of partiality, and which the most skeptical may verify for themselves. Laying aside entirely the question of the policy or impolicy of annexation, the fairest way of estimating the value of the acquisition appears to be that of comparing it with other recent annexations, and applying rigorously the same standard of estimation to all.

For this purpose Florida, Texas, and New Mexico have been selected. The latter includes what is now known as Arizona, which was not separated until 1863. The statistics have all been calculated on a gold basis, and up to the date of 1860, in order to avoid the complications and disturbances brought about by the war. In the case of Alaska they cover the time from the formal reception of the Territory up to January 1, 1871.

Florida, ceded by Spain in 1819, came actually into our possession in 1821 (when the Territorial government went into operation), and entered the Union as a State in March, 1845. Its cost to the United States has been as follows:

Original cost.....	\$5,000,000
Simple interest, at 5 per cent., on the cost for 40 years.....	10,000,000
Cost to the United States of the Seminole war, terminating in 1840.....	30,000,000
Interest, at 5 per cent., on the same for 20 years.....	30,000,000
(a) Cost of the Territorial government, at \$15,000 annually, 24 years.....	360,000
Interest on the same for 16 years.....	288,000
(b) Cost of United States mail service above receipts.....	175,000
(c) Cost of United States officials since admittance.....	150,000
(d) Cost of United States hospitals, forts, navy-yards, etc., 1845-1860.....	7,338,226
(e) Value of land grants from United States, 14,049,797 acres, at \$1 25.....	17,562,246
(f) Cost of United States soldiers in time of peace.....	1,100,000
Interest on items a to f at 5 per cent..	20,948,087
Total cost to the United States...	\$122,921,559

The cost of the Seminole war is variously estimated, and the above statement of \$30,000,000, given by a writer in the "American Cyclopædia," when we include in it the cost of removing and establishing the tribes in the West, with their subsequent grants of land and annuities, is certainly within the mark. The cost of the Territorial government is estimated at the average cost of such governments at that period. The average appropriation for forts and military establishments, barracks, marine hospitals, and navy-yards from 1850 to 1860 was \$489,000 per annum, and the estimate above made of the total cost is probably less than the real amount. The revenue-cutter service, light-houses, and coast surveys have not been included in the estimates. The land grants were for schools and internal improvements, and are official. The aggregate interest on the items a to f has been computed by estimating the average period of each item, and calculating the average period for which the gross amount should pay interest from those estimates. To offset the sum thus expended by the United States we have the following direct credits:

Receipts from customs over expenses...	\$146,816 00
Receipts from sales of public lands.....	1,695,198 15
Interest on the above sums.....	1,842,014 15
Total direct credits.....	\$3,684,028 30

Deducting this from the cost, we have \$119,237,530 70 as the gross indebtedness of the State of Florida to the United States.

It is evident that the sources of revenue just mentioned afford no index to the value of a given Territory as an appanage of the Union, and this places in the clearest light the absurdity of the demand, not uncommonly expressed, that Alaska should return, in the shape of customs and direct taxes, a good commercial interest on its cost into the United States Treasury. The only just manner in which a value can be assigned to any given portion of the Union in relation to the remainder is by estimating its producing and sustaining capacity with regard to the community at large, taking into consideration its undeveloped yet possible resources, and regarding the former as the interest on the

investment made by the whole people for their common benefit through the agency of the government.

In estimating the net value of the productions of the Territories alluded to, after much time spent in collecting information in regard to the various items, it has seemed that the true net annual product of a given district was more accurately determined by taking the average annual increase in the value of real and personal property, and adding to it the estimated annual sustaining capacity, than by attempting to determine the value of separate items, which are often involved in inextricable confusion one with another, and hence impossible to estimate with sufficient accuracy. The sustaining capacity has been computed on the basis of the annual increase of population, allowing for each individual, young or old, the sum of \$300, which is probably a sufficient estimate of the average amount required to sustain one person for a year. Slaves would properly be excluded from the estimate of property, but would be added to the estimate of individuals sustained, which would not alter the figures which follow:

Annual increase in value of real and personal property.....	\$5,020,923
Increase of population annually, average of 30 years, 1648.3—equal to a sustaining capacity of	594,510
Total annual net increase.....	\$5,615,433

This may properly be regarded as the interest paid on its cost by the State of Florida to the people of the United States, and is equal to about five per cent., from which the present annual expenses should be deducted, to show the net annual interest.

The State of Texas came into the Union in December, 1845, without any Territorial probation, and contained an area of 325,520 square miles. Her cost, estimated on the same basis as that of Florida, was as follows:

Proportion (one-third) of the cost of the Mexican war.....	\$55,500,000
Interest, at 5 per cent., on the same for 15 years.....	41,625,000
Proportion of United States bonds (act of August, 1850).....	5,000,000
Interest on these bonds for 10 years.....	2,500,000
(a) Cost of United States mail service over receipts	854,665
(b) Permanent military establishments..	900,000
(c) United States civil officials.....	150,000
(d) Cost of army in time of peace.....	48,360,000
Interest on items a to d.....	17,592,632
Total cost up to 1860.....	\$172,482,297

The direct result of the annexation of Texas, foreseen by most politicians at the time, was the war with Mexico. This must be taken as a part of the cost to us of the State. The cost of the war is carefully footed up by General Mansfield, in his "History of the Mexican War" (8vo, New York, 1848), as amounting to \$166,500,000. It would be perfectly just, perhaps, to charge the whole of this amount to the State of Texas, as the

war was waged directly for her acquisition; but in view of the fact that New Mexico and part of California were among the ultimate results, it has seemed more impartial to divide the expenses among them in proportion to the area acquired. This is nearly equal in the several cases, and was of unknown value at the time, wherefore one-third of the entire cost of the war and its accompanying expenses has been apportioned to each. Texas brought no public lands to the United States. In consideration of her cession of territory to New Mexico, to provide for her school system and the settlement of claims, and, in short, to put her on her legs financially, the United States, in 1850, appropriated ten millions in five per cent. bonds. One-half of this has been charged against New Mexico, in consideration of the territory ceded to her, and the rest remains in the Texan account.

The cost of the United States mail service has been estimated by a series of averages, and probably does not represent the full amount. The military establishments are exclusive of those connected with the Mexican war, and do not include arsenals, barracks, camps, hospitals, or revenue-cutter service. The sum is estimated from the few accessible statistics. The force employed in Texas in times of peace varied from forty to fifty-four companies. The cost of civil officers of the United States does not include jails, custom-houses, etc., nor are losses by Indian depredations included.

For direct returns we have:

Receipts from customs over expenses....	\$413,966 23
Interest on the same.....	155,247 32
Total direct income.....	\$569,213 55

The interest on payments extending over a period of years is in all cases estimated as in the case of Florida. Deducting the sum above mentioned, we have, as the net indebtedness of Texas to the United States, up to 1860, the amount of \$171,913,083 45.

The indirect annual credit, as in the case of Florida, is as follows:

Average annual increase in the value of real and personal property.....	\$31,246,014
Average annual increase of population, 26,441, equal to a sustaining capacity of..	7,932,300
Total annual credit.....	\$39,178,314

This sum is equal to an annual interest on the net cost of twenty-three per cent. I am unable to estimate the present annual expenditures of the United States in Texas; but they can hardly reduce the interest more than two or three per cent. No State in the Union, if we except California, has increased more rapidly in material prosperity than Texas. In any light she would appear to be a good investment.

The Territory of New Mexico, including part of Arizona, came into the Union through the Treaty of Guadalupe Hidalgo in 1848, its area being about 210,000 square miles. Difficulties arising between the United States

and Mexico in relation to the boundary were settled by the Gadsden Treaty of 1853, which gave ten millions to Mexico in consideration of the cession of a large part of what now constitutes Arizona, then united under one Territorial government with New Mexico.

The cost of the whole territory under the name of New Mexico may be estimated as follows:

Proportion of cost of Mexican war..	\$55,500,000
Interest on the same, at 5 per cent., 12 years	33,300,000
Proportion of Texan bonds of 1850..	5,000,000
Interest on the same	2,500,000
Paid by the Gadsden Treaty.....	10,000,000
Interest on the same, 7 years.....	3,500,000
(a) Cost of mail service over receipts....	100,000
(b) United States military establishments	3,000,000
(c) United States army stationed in the Territory	33,000,000
(d) Civil and Territorial officials.....	100,000
(e) Library, Territorial buildings, etc....	400,000
(f) Land grants, 7,493,120 acres, at \$1 25.	9,366,400
(g) Indian expenses.....	15,000,000
Military roads, 1855.....	200,000
Interest on cost of roads, 5 years, at 5 per cent.....	50,000
Interest on items a to g, for average period	18,289,920
Total cost up to 1860.....	\$189,306,320

The cost of the mails is averaged from reports up to 1853, since which time the business has greatly increased without a corresponding increase in the receipts, and the true sum is probably much in excess of the above estimate. No information could be obtained from the War Department in relation to the cost of forts and other military establishments, and it has been estimated as moderately as possible from facts obtained from other sources. The land grants are official, and do not include those made for Pacific railroads. The expenses of the Territorial government, civil officers, etc., are partly official and partly averaged from the costs in specified years. The expense of maintaining soldiers in this Territory is not less than \$1000 per annum per individual, and has been estimated on this basis by averaging the number of troops from year to year as given in official documents. The Indian expenses are greater than the estimate, which is based upon averages taken from annual official reports, and includes not only \$225,000 paid annually by treaty stipulations and for incidental expenses, but the cost of feeding destitute and captive Indians, agencies, presents, etc., etc. The losses by Indian depredations have not been taken into account. The item for military roads is probably not unique, but I have not discovered any others in looking over the reports. As a direct offset we have:

Received from sales of public lands—480 acres at \$1 25 (official).....	\$596 00
Interest at the averaged period.....	196 80
Total offset up to 1860.....	\$792 80

which, deducted from the total cost, leaves a net indebtedness of \$189,305,527 20, upon which the Territory should pay interest.

For indirect credits we have:

Annual increase in value of real and personal property.....	\$1,563,929 80
Annual increase of population, 2551, equal to a sustaining capacity of.....	765,300 00
Total annual interest.....	\$2,329,229 80

The annual product of mining industries, according to the official report of Ross Browne, is about \$500,000, which does not cover the cost of production and the amounts sunk in fruitless mining enterprises. The famines recorded or anticipated in almost every annual report of the Secretary of the Interior do not give a favorable idea of the agricultural resources. The total annual product of the Territory does not much exceed the annual amount expended there by the United States for the army alone, and it may not unfairly be surmised that the entire population subsists almost exclusively on the expenditures made by the United States for its employes and representatives in that region.

In regard to the Territory of Alaska much more exact statements can be made. Thanks to the storm of derogation which has followed her advent into political life, the statistics bearing on her cost, those of maintaining the army and collecting the customs within her borders, all have been put on record officially within a very recent period, and can be given with entire confidence in their accuracy. Far less attention has been vouchsafed to her productions: nevertheless accurate and reliable statistics, which have been verified with the strictest care, are not wanting. Alaska was officially surrendered to the United States on the 18th of October, 1867. Her area comprises 580,000 square miles, including islands, with a coast-line of 26,000 miles, studded with fine harbors, and to a large extent heavily wooded with the most valuable timber. Her cost to the United States up to January 1, 1871, has been as follows:

Paid in pursuance of the treaty.....	\$7,250,000 00
Interest on the same, at 5 per cent....	1,267,000 00
(a) Military expenses.....	231,900 00
(b) Steamer purchased for military purposes.....	130,000 00
(c) Disbursed on account of customs and revenue-cutter service.....	285,552 69
(d) Postal service.....	212 50
(e) Special agents.....	8,424 00
Interest for the average period on items a to e.....	65,608 92
Total cost.....	\$9,238,698 11

From this is to be deducted:

Receipts from customs...	\$21,331 67
Receipts from post-office.....	517 67
Rental of seal fishery, 1870.....	55,000 00
Tax and bonus on 50,000 seal-skins.....	131,250 00
Steamer on hand.....	130,000 00
Interest for the average period on these items..	27,228 52
Total.....	\$365,327 86

Leaving as net cost..... \$8,873,370 25

The military expenses for the period end-

ing February, 1870, are from the report of the Secretary of War to Congress. The remaining portion of 1870 has been given at the figures stated by Major Tidball in his report. It is proper to mention that the expenses of all kinds have been of late very materially reduced. The other items are from the same sources, except \$2400 which has been added for the estimated expenses of special agents during the remainder of 1870. The Secretary of the Navy states that no extra expenses have been incurred in his branch of the service on account of Alaska. The present annual cost to the United States of the Territory in question is as follows:

Interest on the cost as above.....	\$443,668 50
Military occupation.....	50,000 00
Cutter, half the year.....	25,000 00
Custom-house.....	8,400 00
Special agents (estimated).....	2,400 00
Total annual expense.....	\$529,468 50

The sum of \$34,800 is paid to the military garrison, and \$13,200 to the officers and crew of the cutter, but these sums would be similarly expended if the troops or cutter were stationed elsewhere, and the figures above given are estimates of the supposed extra expenses, averaged from previous official data. Were the troops stationed in Arizona, the extra expense would be much greater, as the cost of transportation by sea is much less than by land or river navigation even for much shorter distances.

To be a profitable investment, the taxes and productions of the Territory must cover the interest on the cost and the annual expenses at least; and we may not unreasonably expect an additional margin as a sort of sinking fund.

The annual receipts are definitely known to amount to the following sums from the respective sources indicated. The estimates are all for gold values.

DIRECT TAXES.

Annual rental of seal fisheries.....	\$55,000 00
Tax on 50,000 skins, allowed to be taken by present regulations.....	100,000 00
Bonus (62½ cents each) on skins.....	31,250 00
Bonus on oil (55 cents per gallon), of which the yield is estimated at one gallon for each seal killed.....	27,500 00
Supplies and schools to be furnished to natives of seal islands.....	2,000 00

PRODUCTIONS.

Value of seal-skins above taxes.....	318,750 00
Furs from Yukon district, annually.....	75,000 00
Other continental furs.....	10,000 00
Furs and fish of Sitkan district, according to Tidball's report.....	51,000 00
Annual yield of sea-otter trade, estimated at one-half the average annual yield of the last 20 years.....	65,000 00
Walrus, ivory, and oil (1868).....	7,500 00
Salt cod-fish (10,612,000 pounds in 1870) ..	754,840 00
Cod-liver oil (10,000 gallons, 1866).....	10,000 00
Whale oil and bone from Alaskan waters, estimated at one-third the whole Behring Sea catch annually, viz., 466,666 pounds of bone, and 1,179,000 gallons oil.....	869,499 60
Ice trade.....	28,000 00
Spars and timber.....	2,000 00
Total annual product.....	\$2,407,339 60

The product of the seal fishery is fixed by law and the regulations of the Secretary of the Treasury. The amount of oil actually saved is not made public, but it is well known that the seals afford, when they first arrive, about two gallons each, which is reduced to one gallon toward the end of the season. I have estimated it at one gallon per seal.

The schools and supplies contemplated by the act of Congress can not be properly furnished for less than the sum mentioned above. The Yukon district produced more than \$100,000 worth of furs in the season of 1867-8; hence the estimate is not unreasonable. The product of continental furs from other districts is unquestionably larger; but as I have no exact figures, I have estimated it at \$10,000. The average annual yield of sea-otter for the last twenty years has been 1300 skins; in 1868 over 2000 were obtained. I have estimated the annual yield at 650 skins, which is certainly below the mark. The skins and tails are sold separately; good skins of both are worth \$125, but have been estimated at \$100. The supply of cod-fish taken has nearly doubled since 1866, but I have estimated the supply of cod-liver oil at the old figures, though it must have largely increased. The cod-fish is estimated at its market price, wholesale, at the close of the season of 1870. While the greater part of the oil and whalebone taken in the North Pacific is from Alaskan waters, I have considered only one-third of it as being the product of Alaska, and computed its value at the price fixed at the Sandwich Islands, as is the custom of the trade. The ice trade is given at the old figures, although it is on the increase, as is the trade in spars. The cod-fisheries have increased since the purchase at the rate of fourteen per cent. per annum, and will doubtless continue to increase.

The act of Congress authorizing the lease of the seal fishery contemplated an annual yield of 100,000 skins, which will doubtless be realized as soon as they have recovered from the indiscriminate slaughter of the last three years. The Alaskan cedar is the only timber in the world which defies alike the rot and the ship-worm. One-fifth of the wharves of San Francisco annually succumb to the ravages of the teredo, though built of the best Oregon pine; and it is not credible, with an effectual remedy within three or four weeks' sail of them, that San Francisco merchants will continue to neglect it. A trade of greater or less extent is bound to spring up in this timber. It is evident from the preceding observations that the business of Alaska, already flourishing, is in a fair way to be largely increased. The cost of production next remains to be considered. It is hardly likely that any unprejudiced person will object to the preceding estimates as

excessive after the explanation which has been made in regard to them.

It is notorious that the profits on fishing and trading operations are far greater than on agricultural or manufacturing business. The value of raw fur-seal skins in London, from the latest and most reliable official reports by disinterested persons, is shown to be from nine to ten dollars in gold. One house in London, also interested in the fisheries, has a monopoly of the operation of dressing the skins, after which they are sold for about twenty dollars each. The cost of production, including freight to London and taxes, is not more than four dollars and a half each, and statements to the contrary are utterly false and unreliable, and will not bear examination. The profit on the raw skins alone is about one hundred per cent., and on the dressed skins about two hundred and fifty per cent. Sea-otter skins and tails cost, including all expenses, twenty-five dollars or thereabouts, delivered in London, and are worth eighty to one hundred and twenty-five dollars. The profit on the continental furs, mink, marten, etc., is about two hundred per cent. The whale and cod fishermen make their voyages on a "lay," or share of the profits, which on successful voyages will average over one hundred per cent. I am inclined to consider fifty per cent. of the entire yield as a perfectly fair estimate of the cost of production, which, deducted from the total, gives us as an annual interest on the cost of Alaska the sum of \$1,203,669 80, which is equal to a little more than fourteen per cent. per annum.

This is taken on the same basis as the annual interest allowed to the examples previously cited; but in the case of Alaska, having the necessary material, which was wanting in the other cases, we will deduct the present annual cost, previously footed up, from the annual interest. This gives us the sum of \$674,201 30 clear net profit annually from the Territory over all expenses of every description, past and present—a result which it is more than doubtful if any other Territory in our whole dominion can parallel.

The general results are as follows: Florida pays us annually 5 per cent.; Texas pays us annually 23 per cent.; New Mexico and Arizona about 1 per cent.; Alaska pays us annually 14 per cent.

Roughly estimating the annual expenses, Florida pays us 4 per cent. net; Texas pays us 20 per cent. net; New Mexico and Arizona pay us nothing, or worse; Alaska pays us 8 per cent. net.

Surely this is an exhibit which is eminently satisfactory, in view of the fact that the Territory is a wilderness, and has been open to the light of civilization only three years. At this rate, admitting even no increase of trade, the Territory would pay for itself within fifteen years. It will be noticed that

there is no deficiency in the post-office account, which few, if any, Southern States can assert with regard to themselves. We were well aware at the time of the purchase that we were not obtaining an agricultural country. Of this we have abundance, and the addition of more would have been small inducement to purchase. But Alaska supplies the deficiencies of our Western coast. California and Oregon have neither cod-fish, fur, ice, nor durable ship-timber. Vessels of Oregon pine will insure for four years only as A 1; and the enormous trees, twenty feet in diameter, so often cited as the pride of Puget Sound, are worthless: no team can haul, or saw reduce them to lumber.

In referring to the numerous erroneous and ill-considered reports on Alaska which have appeared from time to time, I am glad to be able to except any statement from censure. The late report of Major Tidball, though incorrect in some minor particulars, and referring only to the limited region of the Alexander Archipelago, around Sitka (a fact not generally understood), appears to have been written with rare and commendable fairness, and to state as closely as possible the real condition of things in the district to which it refers. The same can not be said, however, of another report, which accompanies it, on the condition and character of the inhabitants of Sitka. The latter is characterized by a flippant indecency fortunately unparalleled among official documents. The inhabitants of Sitka are well known to be, in large part, the offspring of Russian convicts and Indians, and their lives are no better than might be expected from their origin. But what have these poor creatures done that the veil, which but half conceals their wretched lives from the contempt or pity of the world, should be shamelessly torn aside, and the charms or deficiencies of these unfortunate daughters of foreign vice and native barbarism recapitulated and detailed with a more than prurient levity? Without teaching, without example, without hope, without the possibility of a decent life, without a creature to regret them when cut off by a miserable and premature death, with only the drunken, gambling priests of Sitka to suggest an idea of any thing beyond the grave—what remains for these unfortunates but an existence of such misery as should turn the harshest censure into the tenderest and deepest pity? If we will stand aloof, and refrain from offering a helping hand to raise them out of their ignorance and vice, at least it ill becomes us to play the part of indecent scoffers. It may also be remarked, that to draw unfavorable conclusions as to the Territory in which these things occur, from the fact of their occurrence upon the premises, is to stultify common-sense.

We are often asked, "What are the in-

ducements for emigration to Alaska?" At present we must answer, none whatever. Congress at its last session fortunately failed to pass a bill extending the land laws of the United States over the Territory. I say fortunately, because the bill was a delusion and a snare, ostensibly opening the country to emigration, while, by forbidding the occupation and development of timber and mineral lands, it cut off all inducements for such emigration. Another bill to establish a Territorial government also failed. What emigrant will seek a region where he must go two thousand miles for the protection of the laws? Again, we are informed that one trading company has obtained the control, by purchase of all the trading stations, of the entire fur trade of the Territory. Such monopolies are fatal to emigration. At present the Territory can only be regarded as a store-house from which the citizens of the Union may draw supplies according to their opportunities.

In conclusion, it may be observed that, while opinions may differ as to the proper method of estimating the value of a country, the mode here adopted being possibly susceptible of amendment, yet, such as it is, it is impartial, and while other methods might perhaps change the figures somewhat, yet the relative position which the various districts here compared bear to each other would probably not be altered. In any case, it is manifestly impracticable and unjust to take the direct taxes alone, as they are paid into the treasury, as a standard. The future value of the 100,000 square miles of fishing-banks comprised in Alaskan waters is a subject upon which much might be said, as is that of the great political importance of the innumerable harbors and ports of refuge now open to American vessels on the Alaskan coast; but the object of this article has been especially to present the present absolute and practical value of the Territory, and to exclude as far as possible all theoretical considerations, thus leaving untouched, but not unappreciated, the political side of the question.

The insufficient manner in which our statistics are collected, and their paucity, such as they are, greatly increase the difficulty of making an exhibit of the value of the productions of any special region. While the data here used have been collected with the strictest care and pains, it must be remembered that there is a margin for error to be allowed even in the official figures. From this cause it is possible that the estimates for the older Territories may fail, to a small extent, in exactness. But it is hardly possible to deny that the question which heads this article has been fairly answered in the affirmative, whatever may be the value of the preceding comparisons.

THE POETRY OF THE ZODIAC.

THE PROTEST OF JUPITER, VENUS, AND MERCURY.

THERE is a sentence in one of the most magnificent of Oriental poems, evidently written before the Hebrew exodus from Egypt, and possibly before the Egyptians emigrated from Arabia, in which Jehovah, in an address intended to show the insignificance of man by an enumeration of the grand works of creation in contrast with his knowledge and achievements, asks Job, an eminent Idumean sheik: "Canst thou bind the sweet influences of Pleiades, or loose the bands of Orion? Canst thou bring forth Mazzaroth in his season? or canst thou guide Arcturus with his sons?"

This sentence may be paraphrased to read: Canst thou bind the sweet influences of the soft south wind and the warm sunshine in giving birth to buds and blossoms in the spring, when the Pleiades appear in the east? or canst thou loose the gales at the autumnal equinox, when the constellation Orion, the dread of mariners, glows in the eastern hori-

zon at evening twilight? Canst thou bring forth Mazzaroth, the varying months of the year, beneath the belt of the zodiac? or guide the swift-rolling and brilliant Arcturus with his sons?—the cluster of stars of which he is the chief.

This early poetical allusion to the splendid scenery of the heavens, with the names of constellations and clusters yet in astronomical nomenclature; the question concerning Mazzaroth, the Chaldean synonym for zodiac; and the evidence of a knowledge of the velocity of Arcturus in the heavens, in the inquiry whether man could "guide" so swift a steed—are remarkable. They indicate the great antiquity of accurate astronomical observations, and the early work of the imagination in frescoing the heavens with earthly forms.

How early these observations began we can not tell, for we find the records dim with the mists of fable that hover along the dividing

line between historic and prehistoric times. We know that nations older than any of which history tells have existed, and evidences of prehistoric civilizations, of which savage nations appear to be degenerated fragments, have been found here and there all over the earth. They doubtless had their enthusiastic, poetic, and philosophic stargazers; and who knows whether the telescope and spectroscope are not rediscoveries of instruments used by philosophers so early as when Seth, a son of Adam, set up a lofty gnomon on the Chaldean plain, and Cain built his city in the land of the vagabonds?

Where these observations were first made in scientific form is equally a question with which conjecture only may deal. Probabilities point to those great levels between the Nile and the Euphrates, over which bends a sky of marvelous purity, and reveals to the unaided eye splendors utterly unknown to us who look upward on the clearest winter night. Hindostan and China claim priority in the production of astronomers; and our inquiries are met by the curious fact that the priests who followed Cortéz to the city of Mexico, more than three hundred years ago, found in a *teocalli* there an admirable zodiac, garnished with hieroglyphic symbols explanatory of the apparent pathway of the sun in the heavens and the ever-varying seasons of the year. Around all these was coiled a huge serpent, the Oriental symbol of Deity and Eternity.

The period is very remote when the present twelve divisions of the sun's apparent path in the heavens, called the zodiac, were made, and the imagination stamped upon each the semblance of an earthly figure as a sign symbolical of a month—namely, a Ram, a Bull, Twin Brothers, a Crab, a Lion, a Virgin, a Balance, a Scorpion, a Centaur or Archer, a Goat, a Water-carrier, and Two Fishes. These are seen in outline upon the circle in the picture at the head of this paper, and as part of the frontispiece to most almanacs, where they are shown in astrological relations to the human body. Long before the Egyptian, Greek, and Roman mythologies were woven from the brain of priest, poet, and philosopher, or, rather, before these modern nations had adopted the more ancient mythologies of the East, and impressed them with their own spirit, these signs of the zodiac, having a relation to the rural occupations of the people, were, with a boldness and moral grandeur unequaled, written in hieroglyphs upon the skies in central Asia, where the year began in March. According to that beginning they made the imperishable stellar record. The assemblage of stars forming the constellation of the Ram was placed first among the zodiacal signs, because the sun was in that part of the heavens when the flocks were taken from the fold to the field. The Lion symbolized the solar

heat at midsummer; the Scorpion the unhealthiness of early autumn; the Balance the equilibrium or equal length of the day and night at the autumnal equinox, and so on all through the whole twelve divisions. In after-times the Chaldeans, Egyptians, Greeks, and Romans, retaining the zodiacal constellations, registered in magnificent hieroglyphs over the whole heavens, in extra-zodiacal signs, the wild legends of the East and the deeds of their own heroes.

In that mysterious East the planetary signs yet used in stellar lore were invented, and were often seen in connection with the open hand, the Hindoo symbol of the Supreme Deity and His creative power. Christian art borrowed that Hindoo thought, and God the Father was never represented otherwise than by an open hand issuing from the clouds until in the twelfth century. In that Hindoo astrological hand the signs of planets were arranged in the following order:

ASTROLOGICAL HAND.

of Venus at the thumb, of Jupiter at the forefinger, of Saturn at the middle finger, of the Sun at the third finger, of Mercury at the little finger, of Mars in the palm, and of the Moon near the wrist. The sign of the moon then, as now, was a crescent inclosing a human profile.

Sun-worship was the natural outgrowth of the inborn religious sentiment, when men had no higher ideas of God than the greatest of His visible works inspired. To them the sun, the vivifier of all things upon the earth, never failing in its appointments, always scattering blessings broadcast for living things, and never changing in power and purpose, appeared like a beneficent creator—a supreme deity. Primitive men every where, grateful for its goodness, bowed before it at its rising with greetings of gladness. It was a reasonable worship for men in the morning twilight of intellectual development. The moon and stars appeared to be the sun's attendant ministers, and invested with the qualities of gods, and these shared in men's anxious orisons and grateful thanksgivings.

Temples were built for this stellar worship, and kings, claiming to be divinely commissioned to rule, were also pontiffs—oracles

of the Father of Lights—and after death were often numbered among the gods. Some temples, like the magnificent one at Babylon, were observatories “reaching toward heaven,” from whose lofty summits the priests, the astronomers of that period, studied the star-jeweled dome, and in fancy saw the clusters of orbs assume the shapes of earth. The powers of nature, visible and invisible, were also deified, and it became a habit to personify all things. The old mythologies, the product of poetic natures, were developed; and men and women, nature and the gods, were jumbled in a confused administration of the affairs of the universe. The earth, the air, and the sea were peopled with supernatural beings in human form—man’s highest conceptions of existence—all ministering to human needs and the distribution of justice. Tutelar deities—guardian angels—presided over households, cities, and empires, and stories of their interference in human affairs were marvelous. The Christian church, after its unholy nuptials with the state in the fourth century, adopted this pagan thought; and ever since the guardianship of saints—canonized Christian heroes, martyrs, and benefactors—over individuals, households, cities, and empires has been a cherished idea in the teachings of the Christian church to millions of souls. The legends of the Virgin and of saints are only the stories of the ancient mythologies in new forms and adaptations. They are only the wide growth of the pagan grafts inserted by Constantine into the Christian tree.

Human passions, the natural and moral elements, the seasons, months, weeks, days, and hours, were all personified, and we are not left to guess their forms. The fine arts of poetry and sculpture have transmitted to us the marvelous records of that fairy realm of religious fancy. Let us look into the record, and see what we may find of the poetry of the zodiac.

Time, of which the zodiac is the majestic symbol or measure, was also called Saturn, the father of the gods, the “Ancient of Days.” He was variously represented by the poets and sculptors. In one of these delineations he appears as an old man with a large beard. He is dressed in a tunic besprinkled with human eyes, denoting that in the course of the year he sees all things in the progress of events. In his right hand he holds a large lighted torch, about which a serpent is twisted, whose folds are covered with clusters of stars, denoting

the constellations of the zodiac. Sometimes he is seen carrying a scythe, indicating that he cuts down every thing—that decay is the fate of all creation. So Time, as a whole, was personified three thousand years ago. It was also personified in parts.

The Year was represented as a man, because in Greek the word is of the masculine gender. In all cases the sex of the Greek deities was determined by the gender of the name. Morning, noon, twilight, evening, and night; the dawn, the day, the week, and the months—were each represented by the human figure, masculine or feminine. And to this day poets and sculptors so personify the passions and the moral qualities of humanity, and time and its divisions. As beautiful in conception and execution as any thing from the pencil and chisel of the Greek, are the “Day” and “Night” of Thorwaldsen, with which we have all been made familiar by copies in plaster and by the photograph.

An antique brass monument was described by Montfaucon one hundred and fifty years ago, as having been seen by himself, in which the days of the week are represented in the persons of the chief gods and goddesses of the Greeks, who were supposed to preside over them. Saturn, the father of the gods, represented as an old man “sated with years,” as Cicero says, sits at the head of the group, in a sort of boat, as the first day of the week—that is, Saturday, or Saturn’s day. Next to him is Sol, the Sun, wearing a radiated crown—the Apollo of later days—as Sunday, or Sun’s day, which is the Christian’s first day of the week, on which the Sun of Righteousness arose and triumphed over death and the grave. Next is Diana, or Luna—the Moon—bearing a crescent on her head, and representing Monday, or Moon’s day. Mars, with only a plain helmet to distinguish him as the god of war, sits in the middle of the group as Tuesday; and at his right is Mercury, the representative of Wednesday. Jupiter and Venus complete the group.

The names of the days of the week used by us are derived from these ancient per-

PERSONIFICATION OF THE DAYS OF THE WEEK.

sonifications by the Greeks, but with partly Scandinavian modifications and transpositions. Beginning the week with Sunday, or the Sun's day, for the first, we have as the second, Monday, or the Moon's day, and for the third, Tuesday, or Tuesco's day. Tuesco was the Scandinavian Mercury, the messenger or will of the gods, the interpreter of their decrees, who, through that will, gave laws to the ancient German nation. Next comes Wednesday, or Wodin's day. Wodin was the Mars—the god of war—of the Scandinavians. Thor was their Jupiter Tonans, the Scandinavian Thunderer, and from him came the name of Thursday, or Thor's day; and Frei, or Frigga, the Venus of the Northern mythology, gave us the name of Friday, or Frei's day. And so it is that we Christians cherish the divine passengers in that mysterious boat, and almost daily in speech perpetuate the ideas of the ancient pagans. The Friends, or Quakers, alone are consistent. They always speak of First-day, Second-day, Third-day, et cetera, of the week.

The seasons, over which the constellations of the zodiac specially preside, were called Hours in the Greek language, and were represented in feminine form. According to Hesiod, they were only three in number, and named respectively Eunomia, Dice, and Irene, daughters of Jupiter and Themis, and representing Equity, Justice, and Peace. Phidias carved only three Hours, or Seasons, along with the three Graces, upon the throne of his great Jupiter. Mercury, to whom is ascribed the invention of the lyre, strung that instrument with only three chords, each tone—acute, grave, and mean—answering respectively to the Summer, the Winter, and the Spring. To the three goddesses of the seasons divine honors were paid. The Athenians dedicated a temple to them. Amphitryon, the Athenian king, was the first who diluted wine with water. Observing that those who drank it undiluted walked bent, and those who drank it so tempered walked upright, he became a reformer of the intemperate, and, regarding the Seasons as the nourishers of the fruit of the vine, he erected in their temple an altar to Bacchus upright, and near it another to the naiads, or water goddesses, to teach the strong-wine drinkers lessons of wisdom.

The Romans frequently made use of the zodiac as the symbol of the Year and of the Seasons. Of the latter they reckoned four, as we do, and personified them by four youths with wings, denoting the neuter gender, three of whom were naked, and the fourth (Winter) warmly clad from head to foot. There was a medal struck, evidently for a Roman senator, and perhaps a consul, on which he and his wife are represented as surrounded by the zodiac. This, doubtless, denoted that the term of his office was one year. A medal was struck for the Emperor Alexander

Severus, on which Jupiter is seen sitting, with emblems of plenty at his feet, and above him the pastime of chariot-racing is delineated. Around the whole is the zodiac. This medal was evidently struck to commemorate a felicitous year of the reign of that emperor, when peace and plenty abounded.

One of the most beautiful and yet most perplexing devices of this kind to the antiquary is an antique gem, which is delineated at the head of this paper. Within the circle of the zodiac are seen Jupiter, Venus, and Mercury in animated conversation. These important deities are unmistakably indicated by their positions and accompaniments. Jupiter sits with a spear in one hand and flaming thunder-bolts in the other, and his feet rest upon an arch sustained by an eagle; Venus appears with her winged son, Cupid, laying hold of her garment; and Mercury, whose office it is to travel day and night, is in the attitude of a man just setting out upon a journey, with his winged cap on his head and his caduceus in his hand.

Concerning the interpretation of this gem, on which the zodiac figures so largely, antiquaries have ventured different conjectures.

We find an apparent key to the truth in one of the eclogues of Ausonius, which, he says, was current in his time. Ausonius was a Latin poet and grammarian, a native of Bordeaux, and son of an eminent Roman physician and senator, and was in his prime at the middle of the fourth century. His literary acquirements were such that the Emperor Valentinian selected Ausonius in his later years to be the tutor of his son Gratian, with whom the master traveled into Germany. When that pupil became a sharer in the royal dignity the master was loaded with honors. He rose by successive steps from a count of the empire to questor, governor of Gaul, Libya, and Latium, and in his seventy-ninth year to first consul. He was a witness of the establishment of Christianity as the state religion, and professed to be a Christian himself; but students have questioned his sincerity, and pointed to the extreme licentiousness and voluptuousness of his writings, and the profusion of heathen mythological machinery in his compositions, as proofs that his sympathies were evidently with the pagans. But with this question we have nothing to do. We accept his verses as literary vehicles of much curious information concerning the subject we are now considering. In the verse alluded to, freely translated, he says, in answer to the question, On what days is it most proper to cut the beard, nails, or hair?

"With keenest blade on Wednesday pare your nails;
With razor sharp on Thursday shave your beard;
And cut your locks on Friday with great care;
Nor heed how Mercury, Jove, and Venus prate."

Commenting upon the custom, Ausonius continues:

"*Mercury*, of thieves the patron and 'complice,
Prizes too well his useful nails in trade
To have them par'd, and, in defiance, shows
How laws and customs he dare violate.
Jove guards his venerable beard from steel;
And not a tress of *Venus* may be clipt
With her consent; though valiant *Mars* delights
In beardless face, and *Luna* in the bald;
And *Sol* and *Saturn* both indifferent are."

So deities and the days of the week and human customs are commingled. In the light of these ancient lines the picture may be interpreted as the protest of Jupiter, Venus, and Mercury at all times and seasons against the custom of paring the nails, shaving the beard, and cutting the hair. Mercury, setting out, shows upon his stretched-out finger his unpared nail; Jupiter is ready with his spear and fiery thunder-bolts to defend his beard; and Venus has her hair so twisted that it would be difficult to cut it. This fancy has evidently been perpetuated in the magnificent gem.

Ausonius rendered a more eminent service to the world in giving a poetical interpretation to a series of remarkable paintings representing an ancient impersonation of the twelve months of the year, or twelve divisions of the zodiac. These he found in the imperial library at Constantinople, in the form of a volume, with a frontispiece which, by a fair rendering of the monogram upon

FRONTISPIECE.

it, indicates that it was made for Valentine by his brother. Lambricius, who published the pictures from the manuscript, supposes him to have been that Valentine who lived in the time of Constantius (son of Constantine the Great, and contemporary with Ausonius), who was at first *Primicerius*, or head of certain official rank; then *Tribunus Protectorum*, or chief of the body-guard, and who,

accused of some crime, was tortured, but acquitted, and appointed general of the army in Illyricum. These impersonations of the months, in costume and other accessories, bear evidences of having been drawn at that period, while the idea, and perhaps the figures themselves, were derived from much more ancient impersonations. I here give carefully made copies of the series of pictures, together with the frontispiece, and a free translation of the poetical descriptions by Ausonius in condensed form. And it is proper to say here that the year at the time these pictures were made was reckoned from the 1st of January, or a few days after the winter solstice, instead of at the vernal equinox, or March, as in the East, where the zodiac was conceived, and the Ram was placed at the head of the signs, as the symbol of the first month of the year. I give as the first illustration the impersonation of January.

JANUARY.

A man in the consular dress of the time of Constantius is the representation of January. That dress consists of a tunic that falls to the middle of the leg, and has a broad border adorned with precious stones. The long sleeves reach the wrist. Over the left shoulder is seen a similarly ornamented scarf, or belt, falling transversely to the right

side. Over the whole is a cloak, or pallium, of large and incommensurable dimensions, falling in graceful folds. On his feet are shoes in the form of our slippers, and a cloth partly covers his head. In the right hand the consul holds a trefoil, the symbol of the Trinity in Oriental and Christian worship, and with his left he is sprinkling incense into the fire upon a little altar of singular and graceful shape. Near the altar is a cock, denoting that it is a morning sacrifice on the 1st of January in honor of the household gods. On the other side is an altar of usual form, on which is a vase containing liquid for libations. The figure of a consul was doubtless chosen because they were invested with the dignity of office in January. Ausonius says:

"At the cock-crowing of the op'ning day
Of the frost-month, to Janus sacred, all
The new-made rulers upon altar fires
Cast precious incense to their Lares giv'n;
And then, on this, the first day of the year
And of the Ages, they, with purple clad,
Saw their names written on the Fasti page."

The month of February is a feminine figure, wearing a curious sort of turban, from which depends a long flowing scarf, or veil, that passes partly back of her shoulders. She is clad in a tunic tied around the waist with a girdle, somewhat in the form of a modern gown, in which her body is protect-

ed from the chilling winds of the season. Her feet are covered, and her action is that of rapid walking. In her hands she bears a duck, which denotes wet weather. The same is indicated by the recumbent urn in the air, out of which water is pouring in abundance. At her feet, on one side, is a heron; that, like the duck, is a hunter for food in the shallow waters and marshes; and on the other side is a fish, which is the zodiacal sign for February. These objects all indicate that it is a watery month—the month of rains in the country where these pictures were made. Ausonius says:

"This is the month cloth'd in cerulean blue,
With waist encircled with a cord of green,
And water-fowl attendant symboling
The moisture of earth's bosom, when the urn
Of Pluvian Jove pours from out the sky
The showers that call the buds and blossoms forth.
Now Februalian offerings expiate
The sins of all the seasons, and the gods
Smile on the nation purified."

The month of March is represented by a half-nude man wearing a wolf's skin hanging from his shoulders and girdled about him. That animal was sacred to the Roman war god, Mars, because a she-wolf gave suck and sustenance to his twin sons by Ilia—Romulus and Remus, the founders of the city of Rome. The representative man holds a wanton kid with his right hand, and just above his left, which is uplifted with the forefinger pointing, is seen a swallow, the harbinger of summer. Near his foot is a vessel of milk. All these symbolize the spring, and indicate the manifestations of the fecundity of the earth. Ausonius says:

"To grateful Mars, whose sons a she-wolf fed,
This month is debtor for its name, whose sign,
A shaggy skin, invests the stalwart man
Who stands for March. He holds a wanton kid,
And in his ear the chatt'ring swallow pours
Her early song. She and the brimming vase
Of milk nutritious, and the verdant grass,
Are all the marks of spring."

The impersonation of April is a man dancing before a small statue of Venus, holding musical instruments in his hands, which appear to be beaten together like cymbals, and with one foot treading upon another, composed of six pipes, having the form of the syrinx of Pan. The ancients had an instrument that was played with the foot, called *crupezia*, but of a different form. The little statue of Venus stands upon a base on which are geometrical lines. Around her is formed a niche or portal of myrtle, a plant that was held sacred to that goddess, and to whom an altar was dedicated in Rome, called *Myrtia*. Before her is a candlestick with a lighted wax-candle. In the feasts in honor of Venus, held in April with public sports, grains of incense were dropped into the flame of the candle as a precious offering. These facts explain the picture here given of April, and accord with the following verse of Ausonius concerning it:

FEBRUARY.

MARCH.

APRIL.

"April pays homage to the Paphian Queen
In myrtle bower; and in this month the light
Of sweetest incense with which Ceres shines
Beams out beneficent. With od'rif'rous
Flame the wax taper burns, and the perfume
Exhaled by Venus fills all with delight."

May is represented as Hermaphroditus, son of Mercury and Venus, and partaking of the double nature of spring and summer. He is dressed in a long tunic with enormous sleeves. In one hand he bears a deep, narrow wicker basket filled with flowers, and with the other he holds a blossom to his nose. This evidently refers to the Roman festival of Floralia, held at the beginning of May in honor of the goddess Flora, when supplications were offered to the deity for the protection of the blossoms. At the feet of May is a peacock, whose tail bears the hues of a bed of flowers; and near by is a stem of flax ready to bloom, all having reference to the season of the unfolding of the buds into blossoms. Of this representative Ausonius says:

"This is soft May, who brings us the delights
Of Spring fast moving toward the Summer goal.
Now with green flax he garnishes the fields,
And from the gardens with sweet flowers fills
Our baskets. For its name to Maia, sweet Maia,
Daughter of Atlas, the bright-blooming maid,
The month is debtor; and it is the month
Which heavenly Urania loves best."

MAY.

June is represented as a naked man, holding in one hand a fresh flaming torch, typifying the increasing heat of the sun's rays, by which the fruits of the earth are brought to maturity. With the finger of the other hand he points toward a sun-dial, the only representation of one, it is believed, that has

JUNE.

been transmitted to us from such remote antiquity. He points to it to show that in this month the sun reaches its greatest meridian altitude, and begins to decline. Behind the figure is a sickle, denoting that the time of harvest is nigh. Near him is a basket of such fruits as ripen so early in warm climates. The poet says:

"Because of summer heats, June is quite nude,
And bears a torch, the symbol of Sol's rays,
That make Earth's bosom fruitful; and he shows
On solar quadrant that the sun has gained
The highest point of all his heavenly path.
Now the ripe fruits of Cancer's torrid zone
May garner'd be; and ripe corn, by Ceres
Cherish'd, is waiting for the sickle sharp."

July is also represented as a man without clothing, and with tanned skin and red hair. In one hand he holds a basket containing bunches of grapes and mulberries. With the other he grasps a purse of gold. Beneath it is seen a sort of cave. At the mouth of the cave is a great heap of coined money. These

JULY.

financial tokens illustrate a custom of the times, when all payments were usually made in July, at the end of the corn harvest. Near the man are seen two ornamented vases with conical covers, the meaning of which is not clear. The poet makes no allusion to them in his verse on July. He says:

"Like June, the month presents a naked man,
With skin nut-brown because of solar heat,
And hair all red, and twined with ears of corn.
Clusters of fruit he in a basket holds,
Gather'd from tropic climes; and a huge purse
He holds above great heaps of gold, wherewith
To satisfy the honest claims of toil."

August also is represented by a man divested of his robes, with his hair thrown back from his face, his chin in a basin of water, and at his side a large vase with two handles, bearing two Greek letters which signify *oxybaphon*, the *acetabulum* of the Romans, or the vinegar vase. These all denote the extreme heat of the weather, when water acidulated with vinegar is a grateful beverage for the thirsty laborer. Before his face is a fan made of peacock's feathers; and on the ground behind him are three large melons, a fruit usually offered to the goddess Diana—Hecate, or the Moon, and sister of Apollo, the Sun—who was born at the ides

AUGUST.

SEPTEMBER.

of August. To this Ausonius alludes in this notice of the month:

"Oppress'd with heat the sturdy month is seen
Plunging his lips in draughts from cooling springs
To quench fierce thirst. This is the honor'd month
In which was born Latona's modest child,
The Queen of Night, Apollo's sister fair;
And evermore will bear the emp'r's name,
Augustus Cæsar."

The month of September is represented as an almost naked man, having only a chlamys, or oblong woolen scarf, thrown over his shoulder, and which floats upon the wind. In his left hand he holds a scorpion, the emblem of deadly miasma in autumn, and the sign for October in the ancient zodiac. It is suspended by a string fastened to its legs, as men and boys were in the habit of suspending lizards for the amusement of seeing them make efforts to escape. In the other hand he holds a vase with apple-like fruit upon long stems; and on each side of him is a tub made ready for the vintage, for it is the month when grapes are gathered in the temperate regions. The two vases, of equal size but of different form, denote the equal length of days and nights which occur in this month. Ausonius says of September:

"He finds the chlamys in his later days
A shield against the gales Orion sends.
And now the grapes he from the vineyard brings
To fill the wine-press with the luscious fruit
From which October pours in copious flood
The purple nectar, fit for men and gods.
Now, too, the golden fruit from trees descend,
And fill the treasures of hopeful toil.
The harvest garnered and the fields broad-sown,
The idlers love to tease the lizard lithe,
And in its struggles to escape the cord
Find low amusement."

October is represented by a man habited only in a sort of cloak, that floats loosely from his shoulders. In his left hand he holds a hare, which denotes the hunting season, and he rests his right hand upon a deep, narrow basket made of osiers, which is held between his knees. The cover, fastened to it by a cord, lies upon the ground. This, and the vase full of fruit near his feet, indicate the time for fruit-gathering from the trees, and also from the vines, for early October, like late September, is the vintage season. Above the man's head is seen a bundle of sticks—the Roman fasces, the emblem of imperial power and dignity. Over these birchen rods is thrown the imperial purple mantle worn by the emperors. In this connection the fasces symbolize October as the monarch of the year, crowned with all

OCTOBER.

the glory of the fruits of the earth. Perched upon the fasces is a raven—"bird of ill omen"—harbinger of death, who has here a double symbolical meaning: it tells the truth that imperial power and dignity must pass away; and it also symbolizes the fact that in October the dying leaves fall, and the subjects of the whole vegetable kingdom begin to decay and perish, or to fall into that winter slumber, the counterfeit of death.

The poet says of this month:

"Hail, bright October! monarch of the year!
Whose golden crown of fruit he proudly wears,
Nor heeds the raven's gloomy prophecy
Of nature's dissolution—winter's sleep.
This is the month when hares, as game, abound,
With full-fed birds the huntsman's meshes snare,
That fill our tables with sweet viands rare.
Now, too, the grapes in tempting clusters hang
From the long vines, and eager hands put forth
Gather them into baskets for the press,
That foams and works, and all the vessels fill
With sweet new wine."

November is a man clothed, for the season of frosts is at hand. It is evident, from his accessories, that he is a priest of Isis, the Egyptian goddess of fecundity—the universal mother—whose worship was introduced into Italy a little while before the Christian era. Her priests were vowed celibates, had their heads shaven, and went barefooted—all

after the fashion copied by Christian monks. In the picture here given the priest leans his right elbow upon an altar, on which is the head of a goat, one of the animals used by them in the Egyptian sacrifices at the annual festival of Isis at this season of the year, when a general purification from sin took place—a sort of scape-goat, as in Jewish sacrifices. In his left hand the priest holds a *sistrum*, a musical instrument sometimes seen in the hands of Isis, and which was played at the annual festival in her honor. The four loose rods of the instrument, which produced the sounds when it was struck, symbolized the four seasons. In his right hand he holds a disk, on which is a rampant serpent, evidently intended as Serapis, the consort of Isis, and symbol of the sun after it has passed the autumnal equinox. In this character it was represented as a serpent—the emblem of the Supreme Deity and of eternity. Upon the tablet are seen lotus leaves, symbols of immortality. Near the priest's feet is a "greedy goose," as Ausonius calls it, which the priest is trying to pacify with the music of the *sistrum*. Its significance here is inexplicable.

The poet says:

"Like Isiac priest November is portray'd,
And on an altar leans, with Capricorn
Ready for sacrifice, while the sistrum
Sounds the music of the seasons. Among
The lotus leaves—eternal life—the serpent
Lies coiled, with lifted head, meaning the sun
Hath the autumnal equinox passed by;
And near his feet a greedy goose is seen,
Impatient e'en of melody divine."

December, too, is represented as a man fully clothed. His tunic is short, and girded at the waist; but his legs are covered with hose, and his feet with shoes. His arms also are covered to the wrists. He wears about his shoulders and breast a cape gaudily ornamented, and in his right hand he holds a flaming torch, indicative of the nourishing heat in the earth even in cold December. By his side is a round table, on which are dice and a dice-cup. His countenance and port indicate a man of the common sort. This figure, dressed for an occasion, is evidently intended as a Roman slave, who, at the Saturnalia, or festival in honor of Saturn, held at the middle of December, engaged with their masters with perfect freedom in all games and amusements and feasting. The festival was a sort of harvest-home, when all the fruits of the earth were garnered, and it was regarded as a period of relaxation and unrestrained merriment. All business was suspended. The law courts and schools were closed. The slaves were exempted from ordinary labor, and permitted to wear the *pileus*, or badge of freedom. They partook of a banquet, dressed in the clothes of their masters, while the latter waited upon them at table. The festival was intended to call to mind the happy

NOVEMBER.

DECEMBER.

times—the Golden Age spoken of by the poets—when, in very ancient ages, Saturn reigned, and there was perfect equality and unalloyed happiness among mortals. In the methods of the festival there was some resemblance to the Italian Carnival and the Christmas holidays in the Christian church. The poet says of this last month of the year:

“Though in December frost asserts its reign,
Yet in the kindly bosom of old Earth
The seeds in heat are nourished. Now the slave,
Born in his master's house, has freedom full,
And feasts from dishes by his master served.
So is recalled the happy Golden Age
When Saturn reigned, and all the earth was full
Of joyous people.”

So it was that the ancient poets, priests, and artists symbolized every thing, and in hieroglyphic, or sacred writing of the hierarchies, and in paintings and sculpture—the books of the unlearned—the multitudes were taught the mysteries of philosophy and science as then understood, and a pantheistic religion, which was better than none.

It has been observed that we have borrowed the names of the days of the week from those of pagan deities. We have also borrowed the names of most of the months from the pagans—the ancient Romans. Their first calendar contained only ten months, for the more ancient zodiac was

then unknown to them. The months were March, April, May, June, Quinctilis, Sextilis, September, October, November, and December. January and February were afterward added by Numa Pompilius, making the number twelve, in accordance with the ancient zodiac, then become known to the Roman authorities. Four hundred years later Julius Cæsar, under the advice of the astronomer Sosigenes, caused the arrangement of the calendar as we now have it, and gave his name to Quinctilis, and it was called July. Augustus Cæsar afterward gave his name to Sextilis, and it became August.

The year in the new Roman calendar was made to begin in January, a name derived from *janua*, a door or gate, and here used to denote the door or entrance to a new era of time—the opening year. It was dedicated to Janus, the Roman deity supposed to preside over the gate of heaven. His temple in Rome was quadrilateral in form. On each side was a door and three windows, representing the four seasons and the three months of each season. And so the zodiac was poetically figured on the Janiculum Hill in prosy stone and timber. The statue of Janus in the temple had two faces looking in opposite directions, one old, the other young, representing the old and the new era; and

in its hand was a key bearing the numerals CCCLXV., the number of days in the year, to denote that Janus unlocked and presided over that whole period.

February was so called by the Romans in honor of Februa, their name for Juno of the Greeks, to whom in this month they offered sacrifices during a festival of twelve days, called the Februalis. These and sacrifices for the dead constituted a sort of purification from and atonement for the sins of the whole year, and were instituted when February was the last month in the year. The words of Ausonius, already quoted, are thus explained. The origin of the name of March has also been already indicated. April is derived from *aperire*, which signifies *to open*, or *to set forth*, and has reference to the season of spring, when the earth opens her bosom to allow vegetation to spring into visible life; or to the opening of the buds, when the leaves and blossoms are set forth in all their beauty. The derivation of the name of May has also been given in the words of Ausonius. It may here be added that Maia was the daughter of Atlas and Pleione, formed one of the Pleiades, or Seven Stars, and was the mother of Mercury by Jupiter. That of June is not so clear. It originally contained only twenty-six days, and it seems probable that its name is derived from *junior*, the younger. July and August were so called in honor of Julius and Augustus Cæsar; and the names of the remaining months are simply the Latin words for seventh, eighth, ninth, and tenth months of the ancient Roman year—the ninth, tenth, eleventh, and twelfth of our year. In speaking and writing of the months, as in the case of the days of the week, the Friends, or Quakers, are the only consistent Christians. They always say, First month, Second month, etc.

The less imaginative Anglo-Saxons gave significant and matter-of-fact names to the months. They called January Wolf month, because they were in more danger then of being destroyed by hungry wolves than at any other period. Of these Thomson says,

"By wintry famine roused,
Cruel as death and hungry as the grave,
Burning for blood, bony and gaunt and grim,
Assembling wolves in raging troops descend."

February was called the Sprout-Kale month, for then the kale, or cole-wort, once the chief vegetable sustenance of the farm-laborers in England, begins to sprout. According to a quaint old writer, March was called Lennet, or Length month, because at the vernal equinox the days begin to lengthen beyond the duration of night. When the Saxons received Christianity, and kept the spring fast in this month, they called that fast Lent.

April was called Eostre, or Oster month, in honor of the old Saxon goddess Eostre, or

Oster, the personification of the east wind, which prevails in England during this month. The Christian festival of the Resurrection falling in this month, it was called Easter by the Saxon Christians. May was named Tri-milki month, because the pasture was then so abundant that they milked their cows three times a day. It was sometimes called Bee month, for it is the time, in England, when the bees make the choicest honey from the fresh clover blossoms. A popular rhyme, concerning the advantage of having swarms of bees early at work, runs thus:

"A swarm of bees in May
Is worth a load of hay;
A swarm of bees in June
Is worth a silver spoon;
But a swarm of bees in July
Is not worth a fly."

June, the first month of the summer season, the Anglo-Saxons called Weyde month, from *weyde*, a meadow; for toward its close the hay harvest began, and the *weyder*, or herdsman, led the cattle into the fields after the new-mown grass was gathered up. In July the hay harvest was completed, and it was called the Hay month. Then it is that, in England,

"The hay field is a pleasant sight,
For happy groups assemble there,
And laughter makes their labor light,
Ringing along the balmy air;
And many a glance and joke oft passes
Between the country lads and lasses."

Barn month was the appropriate name for August, when in the barns the hay and grain crops were all gathered; and in ancient times the Anglo-Saxons celebrated the happy event by amusements and feasting. Of this festival an English poet says:

"And harvest-home's a lovely sight,
The relic of an ancient day—
A simple feast, that gave delight
Through many an age now passed away.
The wain, the song, the earth's the same—
The feast hath only left its name."

In September the Anglo-Saxons brewed their barley-beer, and they called that zodiacal division Barley month. And because in October the wine-presses were at work, they named it Wine month. Then came November, with its high winds, stripping the trees of their sere foliage.

"There is a fearful spirit busy now:
Already have the elements unfurled
Their banners; the great sea wave is upcurled;
The cloud comes; the fierce winds begin to blow
About, and wildly on their errands go;
And quickly will the pale red leaves be hurled
From their dry boughs, and all the forest world,
Stripped of its pride, be like a desert show."

This blustry month the Anglo-Saxons very appropriately named Wind month. It was also called Blood month, as it was the time when cattle and swine were slaughtered for the winter store.

Last comes December. Of this Bernard Barton says:

"Thou hast thy beauties; sterner ones, I own,
Than those of thy precursors; yet to thee
Belong the charms of solemn majesty
And naked grandeur. Awful is the tone
Of thy tempestuous nights, when clouds are blown
By hurrying winds across the troubled sky."

The earlier Saxons called it simply Winter month; but the Christian Anglo-Saxons named it Holy month, because the festival of Christmas, in commemoration of the birth of Christ, occurred in this month. In the old times of the Saxon era in the history of England, and far down toward our day, the great Christmas festival made December the most cherished month of the twelve in the hearts and minds of Christian men and women in that realm. It was a season of great joy, of merry-making and feasting among all classes of people, from the monarch to the peasant. English literature, in prose and verse, is full of descriptions of the scenes of the festival, when friends and neighbors gathered at the board, and partook of good cheer of every sort. The spirit of the time was shadowed in this verse of an old song:

"Now Christmas is come,
Let us beat up the drum,
And call all our neighbors together;
And when they appear,
Let us make them such cheer
As will keep out the wind and the weather."

Another says:

"Then well may we welcome old Christmas to town,
Who brings us good cheer and good liquor so brown;
To pass the cold winter away with delight,
We feast it all day and we frolic all night."

So did the old Anglo-Saxons figure for themselves the twelve signs of the zodiac in the homely ideas of rural life. There was not much poetry in the pictures. But an Anglo-Saxon of later days—the great Spenser—delineated the months in touches of great spirit and poetic beauty in his "Faëry Queen," as we shall observe presently. Others, in fancy, have garnished the zodiac with gems and flowers and fruit. There is a popular belief in Poland that each month is under the influence of a precious stone, and that such influence has a corresponding effect upon the character and destiny of the person born during the respective month. For January they assign the garnet, which denotes the controlling influence upon character of constancy and fidelity. For February, amethyst—sincerity. March, bloodstone—courage, presence of mind. April, diamond—innocence. May, emerald—success in love. June, agate—health and long life. July, carnelian—a contented mind. August, sardonyx—conjugal felicity. September, chrysolite—antidote against madness. October, opal—hope. November, topaz—fidelity. December, turquoise—prosperity.

A modern Anglo-Saxon has, in fancy, hung garlands of flowers and clusters of fruit upon the rim of the zodiac, after this manner:

At Aquarius, the *Water-carrier*—January—a garland of sweet-scented tussilage inclosing a robin; one with its perfume, the other with its song, giving cheer to the dreary month. At Pisces, or the *Fishes*—February—a wreath of snow-drops surrounding a pair of goldfinches, this being the month in which these flowers appear, and birds begin to mate and prepare to build their nests. To Aries, the *Ram*—March—a branch of the almond-tree in blossom inclosing a bird's nest. To Taurus, the *Bull*—April—a branch of the vernal furze in a golden basket, bearing a linnet on her nest. To Gemini, or the *Twins*—May—a hawthorn-bush in full flower, in which is a nest of young birds clamoring for food. To Cancer, or the *Crab*—June—a wreath of flowering grape twigs encompassing a bunch of ripe strawberries. To Leo, or the *Lion*—July—a wreath of the fragrant purple thyme surrounding a cluster of ripe red cherries. To Virgo, or the *Virgin*—August—a coronal composed of wheat, barley, and oats inclosing a bowl of ripe plums. To Libra, or the *Balance*—September—a wreath of hops encircling a cluster of purple grapes. To Scorpio, or the *Scorpion*—October—a collection of various-colored China-asters enveloping a heap of hazelnuts. To Sagittarius, or the *Archer*—November—a garland of ivy with turnips and carrots in the centre. To Capricornus, or the *Goat*—December—a garland of holly, with its glossy green leaves and vermilion berries, from the centre of which hangs a branch of mistletoe, that figured so conspicuously at the festivities of Christmas, when it was the privilege of the lads to kiss the lass found standing beneath the hanging mistletoe bough.

It is a puzzling fact to the general reader that, owing to the precession of the equinoxes, or the shifting of the equinoctial points from east to west, a change has occurred in the relation between the signs of the zodiac and their respective asterisms. Two thousand years ago the zodiacal signs and asterisms corresponded; so that when the sun entered the first point of the sign Aries, he entered also the constellation of that name. The effect of the precession has been to separate the asterisms from their denominational signs, so that the constellation Pisces is now in the sign Aries, and the constellation Aries in the sign Taurus. But it is the poetry of the zodiac, not its prose, that now concerns us; and I shall not stop to interfere in the stellar disturbance by trying to explain it, nor quarrel with the venerable old circle or the equinoctial line, but present illustrations of the signs and their corresponding asterisms as the ancient poets and astronomers conceived and defined them, with the Hindoo hieroglyph

of each, and leave the unraveling of the tangle in the heavens to others more expert. I will state the consoling fact that (so astronomers say) in about twenty-three thousand years the zodiacal signs and constellations will nominally agree, when perplexity will cease.

ARIES, THE RAM.

Aries, the Ram, originally at the head of the signs, is distinguished by two bright stars near each other in the head of the figure. This is one of many instances where stars of more than ordinary brilliancy are seen in pairs.

TAURUS, THE BULL.

Taurus, the Bull, is one of the most attractive of all the constellations of the zodiac. It includes the two remarkable clusters known as the Pleiades and Hyades, the former on the shoulder and the other in the face of the figure. This group is just rising in the east when Aries is about twenty-seven degrees high. It has been called the "snowy" and the "stormy" constellation; and the Romans spoke of the Pleiades as the "Virgins of the Spring."

GEMINI, THE TWINS.

Gemini, or the Twins, is east of Taurus, and is distinguished by two principal stars, Castor and Pollux. Images of these twin brothers, St. Paul says, formed the figure-head of the ship in which he and his traveling companions were taken from Malta to Sicily after their shipwreck on the coast of the first-named island during the equinoctial gale. The Hindoos represented the Twins by two kids. The Greeks changed them to twin brothers, and the Arabians to two peacocks, because the prophet would not allow them to depict the human figure.

CANCER, THE CRAB.

Cancer, or the Crab, is inferior to most of the other constellations, having no very conspicuous stars. Near it is a nebulous cluster of minute ones.

LEO, THE LION.

Leo, or the Lion, next east of Cancer, is a magnificent constellation, having two stars of greatest magnitude, and several that are very conspicuous.

Virgo, or the Virgin, a woman holding an ear of wheat in her hand, is east of Leo, and is very rich in beautiful stars. One in the wheat-ear—Spica Virginis—stands in solitary splendor, no star being near it larger than of the fourth magnitude.

Libra, or the Balance, is an

VIRGO, THE VIRGIN.

LIBRA, THE BALANCE.

emblem of the goddess of justice; and is sometimes, as in the sign of Libra, represented in feminine form, with the balance, or scales, in her hand. It has four conspicuous stars that form a quadrilateral figure.

SCORPIO, THE SCORPION.

Scorpio, or the Scorpion, exhibits a collection of most beautiful stars. One (Anteres) is of the first magnitude, and is an eminently conspicuous object in the heavens.

SAGITTARIUS, THE ARCHER.

Sagittarius, the Centaur, or Archer, has only subordinate stars. These may be easily arranged into geometrical figures. It is close by the Milky Way.

CAPRICORNUS, THE GOAT.

Capricornus, the Goat, is one of the least of the zodiacal asterisms. It was one of the most celebrated among the later Romans, for under it the emperors Augustus and Vespasian were born. It marks the southern tropic, or winter solstice, and was poetically called by the old Greeks the "Southern Gate of the Sun." Now the sun does not reach the constellation until the middle of January.

AQUARIUS, THE WATER-CARRIER.

Aquarius, the Water-carrier, is easily recognized by the unaided eye by four stars forming the letter Y. The Arabs made a mule the Water-carrier, for the same reason that they changed the Twin Brothers to two peacocks.

PISCES, THE FISHES.

Pisces, the Fishes, is composed of a loose collection of stars, quite small, and is difficult to be traced. It occupies a large triangular space in the heavens. It is now the constellation that presides over the vernal equinox, an office formerly held by Aries, and which, in the course of centuries, the present incumbent must resign to Aquarius, by reason of the precession of the equinoxes.

We have observed what the Latin poet has said about the months in Italy and on the borders of the Hellespont, as represented by an artist of his time. It seems appropriate to close this paper by a poetical description of the grand procession of the months in their more ancient impersonations, as given in the above illustrations of the signs of the zodiac. It is by Edmund Spenser, who lived in the higher latitude of England, and flourished more than a thousand years after Ausonius discovered the pictures made for Val-

entine in the imperial library. Spenser says:

"Then came old January, wrappéd well
In many weeds to keep the cold away;
Yet did he quake and quiver like to quell,
And blow his nails to warm them if he may;
For they were numb with holding all the day
A hatchet keen, with which he felled the wood,
And from the trees did lop the needless spray.

"And after came cold February, sitting
In an old wagon (for he could not ride)
Drawn by Two Fishes, for the season fitting,
Which through the flood before did softly slide
And swim away; yet had he by his side
His plow and harness, fit to till the ground,
And tools to trim the trees.

"And sturdy March, with brows full sternly bent,
And arméd strongly, rode upon a Ram,
The same which over Hellespontus swam;
Yet in his hand a spade he also hent,
And in a bag all sorts of seeds, the same
Which on the earth he strewéd as he went.

"Next came fresh April, full of lustyhed,
And wanton as a kid whose horn new buds:
Upon a Bull he rode, the same which led
Europa floating through th' Argolic floods:
His horns were gilded all with golden studs
And garnishéd with garlands goodly dight
Of all the fairest flowers and freshest buds
Which the earth brings forth.

"Then came fair May, the fairest maide on ground,
Decked all with dainties of her season's pride,
And throwing flowers out of her lap around:
Upon Two Brethren's shoulders she did ride,
The Twins of Leda, which on either side
Supported her like to their sovran queen.
Lord! how all creatures laughed when they her spied,
And leaped and danced as they had ravished been,
And Cupid's self about her fluttered all in green.

"And after her came jolly June, arrayed
All in green leaves, as he a player were;
Yet in his time he wrought as well as played,
That by his plow-irons might well appear.
Upon a Crab he rode, that him did bear
With crooked, crawling steps—an uncouth pace:
He backward rode.

"Then came hot July, boiling like to fire,
That all his garments he had cast away.
Upon a Lion, raging yet with ire,
He boldly rode, and made him to obey;
Behind his back a scythe, and by his side
Under his belt he bore a sickle, circling wide.

"The eighth was August, being rich arrayed
In garment all of gold down to the ground;
Yet rode he not, but led a lovely Maid
Forth by the lily hand, the which was crowned
With ears of corn, and full her hand was found.

"Next him September marchéd eke on foot:
Yet was he heavy-laden with the spoil
Of harvest riches, which he made his boot,
And him enriched with bounty of the soil.
In his one hand, as fit for harvest's toil,
He held a knife-hook; and in th' other hand
A pair of Weights.

"Then came October full of merry glee,
For yet his nowl was totty of the must
Which he was treading in the wine-fat's see,
And of the joyous oil, whose gentle gust
Made him so frolic and so full of lust.
Upon a dreadful Scorpion he did ride;
He had his plowing-share and coulter ready tied.

"Next was November; he full-grown and fat
As fed with lard, and that right well might seem;
For he had been a fattening hogs of late,
That yet his brows with sweat did reek and steam.

Nor heeded he the Archer's bended bow,
The Centaur hunter who might lay him low.

"And after him came next the chill December;
Yet he, through merry feasting which he made,
And great bonfires, did not the cold remember,
His Saviour's birth so much his mind did glad.
Upon a shaggy-bearded Goat he rode,
And in his hand a broad, deep bowl he bears,
Of which he freely drinks a health to all his peers."

THE REVEREND SAMPSON'S CHRISTMAS GIFT.

THE Reverend Sampson Beatty strode about his study one cold morning in December, and looked threateningly on his little wife. One would have thought, from his manner, that she had committed some grievous sin, for she clasped her hands together with a gesture of entreaty, and followed him about pleadingly with her eyes.

There had never been a missionary for woman's rights up among those bleak hills, and the little woman's education in this way had been sadly neglected. She never ventured upon expostulation with her husband, and when he was vexed, not only gave him the first but the last word.

Fortunately for Mrs. Beatty, her husband was as gentle in spirit as he was pure in soul, and would sooner have cut off his right hand than added one care to the many that beset her, so sorely against his will.

"It is a bitter humiliation," he said at length, the hot color flaming into his cheek. "I never thought I should descend quite so low as this, Lucy—to have people going about with a subscription paper in my behalf, as if I were a very pauper! and I in the full vigor of manhood, with health and strength and head to work. God knows I *do* work early and late; I am no laggard in the vineyard. Is not the laborer worthy of his hire?"

"But, Sampson," said the little wife, "you know it is quite customary around Christmas time; and they mean it for the best—I am sure they do. But if you feel so badly about it," she added, noting the frown deepening on his brow, "I need only speak to Mrs. Beverly, and it can be stopped; only"—the low voice faltered. The minister looked down upon his wife, and smoothed her hair tenderly—"Only it would be a terrible disappointment to you, dear; is it not so? No wonder your pride is crushed and your spirit broken, my poor child. Don't think for a moment I forget my little helpmate, bearing the brunt of the battle and wearing a cheerful face to hide a woful heart. I know all the patches in the wee jackets, dear, and the skillful darning in the carpets, and heard the sad lament of the little ones over their lack of sugar this morning. Once for all, Lucy, don't think I am ungrateful or indifferent enough to be ignorant of even the details of our poverty. I know their full ex-

tent. And now leave me to myself, little woman. Let them do as they will. If it will serve to make you happier, I will try to be content."

Mrs. Beatty went quietly from the study and left her husband to his rueful ruminations. He bent himself over his unfinished sermon with a heavy sigh, and felt in his heart that his life had been a failure. When he looked back upon his lost youth he wept in very bitterness over the hopeful, vain-glorious dreams that had vanished one by one, and left him upon this wintry morning almost desolate. He had in that youthful onset pictured to himself a life of chivalrous strife and glorious victory, and had entered upon his ministry with the burning zeal and earnest self-sacrifice of a Savonarola. But he felt himself, as the years rolled on, a veritable Don Quixote, struggling with windmills. Gigantic and powerful windmills surely, for they represented all the petty passions and meannesses of the human heart; but they were of that calibre that they blunted his weapons and rendered his strife almost ridiculous.

Were all these years of study, these haughty resolves, and glorious determinations, to be wasted in entreating stupid clodhoppers to remain awake for one little hour upon Sunday, or in endeavoring to reconcile Mrs. Jones to her neighbor's bay-window?

Not once did he see a glimmer of light in the faces of his parishioners when he expounded to them, with all the eloquence and force of which he was capable, the epistles of the apostles; nor did they show the least enthusiasm when he read to them a sermon over which he himself had wept with emotion.

"Can it be well," murmured the wicked parson, "to people paradise with souls like these?"

It seemed as if a gulf widened between him and his people day by day, and soon he should not even be able to stretch out his hand to them.

In the mean time, however, Mrs. Beatty went about the house with a smile of genuine joy upon her face. Mrs. Beverly had hinted that they would probably raise seventy-five dollars for the Christmas gift, and the little woman's imagination exaggerated this sum of money into a fortune, and revelled in the abundance in store for them.

Oh, if she could only have the spending of the money herself—she knew so well what they most needed! But of course this was out of the question; beggars could not be choosers; and Mrs. Beatty went joyfully back to her sumptuous visions—rolls of flannel, pieces of linen, warm colored merinoes; odorous coffee, aromatic tea, the whitest of sugar; jars of jelly; pickles, hams, and sausages; jackets for Johnny, needle-work for baby, a doll-baby for Nell; perhaps, oh, perhaps a

musty old book for Sampson: all these and more passed and repassed through her brain, and the brown eyes brightened, the lips shaped themselves into a smile, as cheerily she rocked her baby to sleep on that cold December morning.

When night came, and the children were sound asleep in their little bed, and baby lay in his wooden cradle, the Reverend Sampson stole into his wife's room, and took an easy-chair by the fire. Such was often his custom, and at these times there was a look of rest and joy in his face that betokened well for the power of that gentle woman over the gaunt, hard-featured man. For hours and hours they talked together, and it was plain to be seen that these hours were the happiest of the poor gentleman's life.

Did she then listen wide awake and attentively to the expounding of the epistles of the apostles? And did the brown eyes fill with tears and the lips quiver with emotion when the eloquent points of the sermon reached her ear and her heart? Well, no. The Reverend Sampson never ventured upon theology with his wife, nor ever read to her extracts from his favorite authors.

"I think, little woman," said the Reverend Sampson, "that you have spent at least three times that seventy-five dollars in your imagination."

"Oh no, dear," replied his wife; "for Mrs. Beverly can get things so cheap. You can't imagine how she beats people down. Then, you know, they always sell things cheaper to a minister."

"The poor wretches are considered worthy objects of charity," said the minister, bitterly.

"Now Sampson," said his wife, feeling quite brave in her own little sanctum, "it is queer to me that you folks always preaching charity don't take to it kindlier, and not bind it down to all sorts of rules and forms. I am sure they always show *me* respect enough. One would think I were a princess."

"And so you are, darling, a princess—a pearl among women."

"You don't think they'd get a sewing-machine?" said the princess, irrelevantly.

"I don't give them credit for such a wise generosity," said her husband.

"No, no," said Mrs. Beatty, hastily, "it would be a shame to swallow up all the money with one thing."

"Well, what would be nice, Lucy?" said the parson, with generous encouragement.

Then she commenced enumerating such a quantity of delicious probabilities that the Reverend Sampson's face lighted up with a smile that deepened and grew broader till it actually culminated in a laugh—a startling thing from the lips of the Reverend Sampson.

"And we'll get a pony and a cow, and a

nice set of fandangoes for the parlor windows, and a brand-new silk dress for little mother," he said.

"Yes, one of these days, please God," said his wife, nothing daunted. "I should not wonder a bit if they gave you a suit of broad-cloth too."

The minister's face flushed wrathfully.

"I don't think they'd venture upon that indignity," he said, with an implied threat in his voice.

Mrs. Beatty looked upon her husband's threadbare coat and saw its darned wristbands with a wistful expression of countenance, but, warned in time, she changed the subject speedily.

So it came about that under the magic influence of his wife, even this Christmas charity was looked upon with favor by the minister, and he caught himself once in a while enjoying the surprise in store for his wife and little ones. He endeavored to give the people credit for the kindly motive that impelled them to the deed, only he could not help wishing it had taken the shape of a larger salary, so that he could have been his own patron.

One morning, meeting Mrs. Beverly with the obnoxious subscription paper in her hand, he smiled faintly, and endeavored to appear ignorant.

"You must not peep into our little secrets," said Mrs. Beverly, playfully, thrusting the paper into her muff.

"Certainly not, dear madam," said the minister, frigidly.

"Of course you'll know all in good time," she said, significantly.

"I shall wait cheerfully, curiosity being a mainspring of evil," said the Reverend Sampson, passing on with a heightened color.

"Gracious goodness!" murmured Mrs. Beverly; "what a disagreeable ramrod he is! He certainly never was made to be a minister!" and the poor lady sighed over the hard fate that compelled her to leave her city home and her city pastor. A vision of grace and splendor rose before her; a majestic form clad in flowing robes, eyes mild and benignant, waving, ambrosial locks, hands more delicate and whiter than her own, a voice softly modulated—tender, caressing, brotherly.

He never would have passed her in the street with a few gruff words, scarcely touching her hand, and averting his eyes with an expression almost of dislike. It was a pleasure for *him* to meet his people and talk with them, advise, counsel them. How sweet, how easy, how comfortable it was to get through her religious duties with so thoughtful, so kind, so affectionate a Mentor!

"If it was not for his wife," she said, spitefully, to herself, "I declare I'd give the

whole thing up. I do wish we could ever get away from this desert;" and poor Mrs. Beverly went on her way, sighing bitterly for the flesh-pots of Egypt.

But ever as the wintry days passed on the minister's wife consoled herself and her little ones for the wants of the household with the generous bounty that was to fall upon them so soon. Let Johnny eat his bread with molasses now, and he should have plenty of butter by-and-by; and if little Nell would be careful with her pinafores a while longer, she should have new ones with a pretty lace frill about the neck.

The days grew darker and colder. Even from their little store of blankets a few were taken for those who had none, and many a meal was stinted in the parsonage to render a poorer table less bare. The minister labored constantly at his Christmas sermon, making it a masterpiece of rhetorical eloquence.

At last the great day came, and the little family were up betimes, all eagerness and expectancy. Even the face of the Reverend Sampson betrayed a faint glimmer of curiosity, and he did not betake himself to his study while breakfast was getting ready. The baby crowed upon his knee, and Johnny clambered by his side, while little Nell solemnly watched the browning of the Christmas muffins. Suddenly a loud knock resounded through the hall, and for a moment the pulse of the family stood still. Then there was a great rush for the door, but, reaching it, there was nobody there. Only a flat, square paper box on the door-sill, with a neatly folded note slipped under the cord that bound it.

Mrs. Beatty lifted the box quite easily, and her heart sank a little when she found it so light.

"I wonder what it can be?" she said, as she handed the note to her husband.

The Reverend Sampson read it aloud:

"REVEREND AND DEAR SIR,—Accept this little Christmas gift as a token of esteem from your parishioners, and please wear it in their honor at the Christmas service."

"Wear it!" cried the minister, with flaming eyes. "What new insult is this?"

Then he tore open the box, and all the little brood, peeping over, saw the hopes of weeks and months dwindle down in a square black compass. But the voice of the minister softened a little.

"It is, after all, a present for you, Lucy. Here is the brand-new silk gown that I promised you."

Lucy took it up with a trembling hand, and let it suddenly fall.

"It—it is a minister's robe, Sampson," she said, and then her voice faltered, for her husband strode over and lifted the shining fabric from the box, scanning it savagely, while his face whitened to his very lips.

Once, twice they opened, but the words refused to be uttered. Taking the robe in his two strong hands, he rent it from top to bottom; then, flinging it upon the floor, he went away to his study.

Poor Lucy choked back her tears, and gathering up the robe and the box, put them well out of sight. The muffins were burned, the coffee was spoiled, the Christmas breakfast was ruined; and away in the study they heard the steps of the enraged minister pacing to and fro. But after the first great shock the sturdy heart of the minister's wife began to take courage; and although many a sigh escaped from her lips, she went about heating more coffee, and making more muffins, so that in half an hour the little folks had quite forgotten the black spectre that had loomed upon them in the shape of a minister's robe. Leaving them at the table, the little woman went softly to the study, and found that her husband was not quite so violent in his displeasure as she had feared. The Reverend Sampson was ashamed of the burst of rage that had overpowered him, and felt in his heart that if he had been sinned against, he was also sinning.

"The fact is, Lucy," he said, turning to the dear face that was so sweet a rest to his eyes and heart, "I begin to fear I must give up the ministry. I am unfitted for it—at least here, dear. We do not understand each other, the people and I. Let them get a block from the city that they can shape and dress to suit themselves, and you and I, little woman, will go farther into the wilderness, where the souls of men are nearer to God."

But his wife shrank a little from this wilderness of which he spoke, and, understanding the people better, pleaded for a longer stay among them.

"But, Lucy, how can we ever reconcile this ridiculous matter of the gown between us?"

Then Lucy made him pause in his walk, and seating herself upon his knee, she unfolded to him a plan that she had been concocting while baking more muffins and heating more coffee; and though the parson shook his head and said nay a dozen times, he ended by going out to breakfast with a smile upon his face.

When upon that Christmas morning the congregation had assembled at the church, there was an air of consciousness among them that made it almost like a social gathering. Many a pew was filled that was ordinarily empty; and even the front seat of the squire bent under his formidable weight. Mrs. Beverly, in velvets and furs, looked down upon her gilded book with an attempt at serenity; but there was an evident restlessness about her when there was a stir at the door, and a whisper that the parson was coming. At last she looked

back with the rest. There was the tall, gaunt form of the Reverend Sampson in his old threadbare coat, the white seams of his well-worn trousers shining in the wintry sunlight, the muscles of his strong arms plainly seen from under his short, tight sleeves, and at every step the ungainly trousers hitching up and down, showing the white, loose stockings. The same as ever—stern, angular, uncompromising, awkward, stiff, repelling—was there ever such a discouraging man? Mrs. Beverly frowned with vexation.

But who was the dainty little woman that tripped after him, rustling in stiff, heavy silk, dragging up the aisle a rich, shining train? It was an odd dress she wore. Mrs. Beverly put up her eyeglass to examine it more closely. Not unbecoming, certainly. The long, flowing sleeves made her little hands look wonderfully pretty; then the material itself was of excellent texture, lustrous and heavy. It hung very full from the shoulders, looped up in voluminous folds about her slim little figure, and widened out in a graceful sweep as she walked. It was made with a yoke—yes, and a square collar. Why, certainly it must be—it was the minister's robe, and this was the minister's wife!

After Mrs. Beverly had recovered from the surprise of the discovery, she could but confess that the little lady did it honor. How quaint and sweet she looked, surely, with her brown eyes full of a tender light, her cheeks glowing from the cold air, a little quaver of subdued glee about her dimpled mouth!

And now was heard the minister's voice, and every eye is bent upon him, every ear listens attentively.

"I will take my text," he said, "from the Gospel according to St. Mark:

"And he called unto him the twelve, and began to send them forth by two and two; and gave them power over unclean spirits; and commanded them that they should take nothing for their journey, save a staff only; no scrip, no bread, no money in their purse; but be shod with sandals; and not put on two coats."

"Now, my dear friends," said the Reverend Sampson, "one word as to your generous Christmas gift: you see it is expressly forbidden me to wear two coats. I have one, therefore I have given the other to my wife, as it seemed best and befitting so to do."

Then, altogether disregarding the sheets filled with rhetorical eloquence at home, he began a fervent and glowing description of the mission given to the apostles of Jesus—of their purity, their self-sacrifice, their earnest devotion, and enthusiasm. He spoke of the birth on that Christmas long ago, of its humility and touching simplicity. There was power and pathos in his voice; a thrill went through the congregation, and with electric sympathy touched the heart of the minister, filling it with an unspeakable joy.

A throng of words fell from his lips, simple, soul-felt, as from man to man and heart to heart. Not an eye closed, not an ear failed him. Tears came into his eyes, and sprang unbidden into those of his listeners. A mysterious power seemed to reign in the little temple. The fat old squire saw a tall marble spire looming up from the church-yard, and for the first time in years he thought of his dead wife. Even Mrs. Beverly's thin lips relapsed from their usual grimace, and an unwonted emotion showed through her artificial complexion. For nearly an hour the little throng of people remained rapt and spell-bound; then the book closed, the minister paused: there was a murmur and stir in the congregation. Up bustled the squire to the pulpit, and shook hands with the minister.

"You robbed me of my morning nap," he said, a kind of shake in his wheezy voice, and something that looked like moisture in his wicked old eyes. When he put out his pudgy hand to the minister's little wife he left a slip of paper in her trembling fingers.

"It's for yourself and the bairns," he whispered, hoarsely; "and if you want to spend it in town, there is a seat for you in the family coach."

Then he waddled away, leaving Lucy overwhelmed with joy, peeping furtively at a hundred-dollar bill firmly clutched in her little fingers.

The Reverend Sampson was surrounded by his people, each one vying with the other in expressing in their simple way the affection and respect that his Christmas sermon had inspired.

Lucy very wisely put the bill carefully by, determining not to disturb her husband's sensitive spirit with this sordid gratification. But, to save her life, as she walked home from church, reaching up her hand to the stalwart arm of her husband, she could not help going back again to the old joyful enumeration, and hugged to herself the precious treasure, till she could show it and explain it with delight to the dear little brood waiting at home for her.

"We won't go to the wilderness, will we, Sampson?" she said.

"The fact is, I never got near to them before," replied her husband, his voice still trembling with emotion.

"Then you are not sorry about the robe, after all, are you?" said Lucy.

"If it was the agent that brought us together, I am more than glad," said her husband.

Not many years after the little woman had her pony and her cow, and her fandangoes for the parlor windows, and the Reverend Sampson rejoiced in the possession of many ponderous musty books and a broadcloth suit; but the one relic and heir-loom of the family is a minister's robe that cost seventy-five dollars. Lucy never wore it again.

QUIET LIFE IN SOME DANISH TOWNS.

IF you will glance over the map you will see that Denmark consists of a peninsula and some islands. The peninsula, however, is not broad, and the islands are not large. We are always near the sea in that country. The sea can be descried almost from every where, and when its silver-blue brim can not be seen as the frame of the landscape, its solemn notes may be heard as the under-tone of the impression.

The land rises only a few feet from the surface of the water, and, when seen at a distance, it seems to float on the waves like an unfolded carpet. The brown hills behind the light green woods undulate in the morning mist as if the waves moved along beneath them, and the small towns, with which the coast is dotted all over, and whose white-washed walls and red tile roofs glare in the early sunshine, look like party-colored nails driven down into the ground to keep the carpet from floating away with the waves.

These towns, which generally number between one and two or three thousand inhabitants, were founded a long time ago. None of them are younger than three centuries, many older than a thousand years, and they all have a venerable pedigree. Not that they inclose any relics of great historical consequence, but they are themselves a sort of relics. When life has gone, only the corpse is left. But if a great and deep remembrance remains, the corpse is a relic. It is men's love and their reverence which make a corpse a relic, and the Danes look on their small towns with a feeling like that the happy old wife cherishes for her faded wedding-gown—with a kind of tender awe. Some of them were built around a castle able to defend the peaceable tradesmen against pirates; for, a thousand years ago, piracy was a fashion, and still, up to the fourteenth and fifteenth century, many, both men and nations, about the Baltic, fed themselves and their fame upon piracy and plunder. The origin of these towns is easily recognized by their names: they are called New Castle, Kallund Castle, Aal Castle, etc. Others were raised on places where the herrings every year shoaled to spawn; the fish often lay in such a multitude at the shore as to be caught with the very hands, or drawn up by scoops, and fishing became thus a very profitable trade to deal in. These towns are generally named after some local peculiarity, such as a magnificent spring, a hill, or a wood of beech-trees. Now the castle has mouldered away—the pirates also. Even the herrings have gone; their armies lie now off the coasts of Norway and Flanders. But the towns still remain. They have not grown worse; nor have they grown better. They do not grow at all.

When describing one of these towns, I describe them all. There is no difference between them, except their names. They consist all of one long meandering street only once crossed by another street, which, however, often is only a way. The cross-street, or cross-way, runs southward to the harbor, a pier, built of stone or wood, and shooting forth into the shallow water sometimes a quarter of a mile. Northward it leads to the church, which is always placed in the middle of the church-yard, and encircled with a high stone wall; in warfare, therefore, it was often used as a fortress. The main street to the left of the cross-way is occupied by the merchants, the mechanics, and some shop-keepers; to the right, by the royal officials, the mayor, the clergyman, the lawyer, the judge, and the physician. The hotel, the jail, the theatre, the apothecary's shop, and other such lofty or fashionable establishments mingle on the right side of the cross-way with the dwellings of the royal officials; while the school and the hospital, the mill and the magazines, are situated on the left. The houses have generally only one story, and are built of stone, with white walls, red gable-roofs, and a large gate opening into the yard. When the wooden folding-doors of the gate are shut up, the front of the house presents a very reserved, not to say reticent aspect, as if some mystery were hidden behind it. But when the doors are opened, and a peep into the yard is allowed, the house looks quite smiling. The yard is a roomy square, encircled by stables and barns, and peopled by swarms of hens, ducks, geese, and turkeys, whose everlasting small-talk enlivens the deep stillness of the long day, and whose controversies, when the sultans of the square fall at variance with each other, sometimes alarm the whole neighborhood. In harvest-time, when the crops are brought in from the fields, the yard is a very busy place; for most citizens in these small towns are agriculturists; with exceptions of some poor mechanics and shop-keepers, they all own land, and agriculture is not only the merchant's, but also the lawyer's and the physician's main business. Even the parson is a man who can not only make a good sermon in a short time, but also buy a good cow for a cheap price; and if said cow happens to stray out of the gate, and stroll around in the street on a Saturday afternoon when its master is meditating on some intricate point of theology, the lawyer or the physician may be seen driving the dissipated animal home to its stall. Life is often a little Homeric in these towns, as far as life can be Homeric without being heroic; for, I must confess, it is the oxen which here play the Homeric part, not the men. The street is not very well paved, nor very well lit up; and a lamp burning late in the dark night is a dangerous fellow to meet with, for it means

that here—not exactly close by, but somewhere in the neighborhood—is an extraordinary pit to break the neck; the ordinary pits, which are not considered worth a lamp, are only to break the limbs. But at day-time here it is cheerful. The street is swept, the doors washed, the panes brightened; all is fair and fine, only a little irregular. Straight lines are out of fashion. I never saw two houses run in a perfectly straight line, and if ever two unfortunate ones should happen to do so, they would, no doubt, be considered a disgrace—nay, perhaps an offense. Every house has its own humor, and roots where it likes to grow. The crooked is the rule set down by tradition, and tradition is a passion with all the inhabitants. Sometimes a linden-tree stands in the very midst of the street. It stands there, worried like a school-boy who has come too early to the pleasure-ground, and finds himself alone; disappointed like a lover who would accompany his sweetheart, but does not know whether she walked up town or down town; amazed like a bewildered elf left alone among the houses when all her sisters went home to the forests. It looks, indeed, very odd, the poor tree, and it bars the passage so completely that the new gold-striped stage, the pride of this century, has to enter the town through the cross-way in order to reach the post-house; but to cut down the tree—gracious! Don't speak of it! It has a right of three centuries to stand there.

And how quiet it is here!—how quiet when the street lies silent at noontide and basks in the midsummer sun! You can hear children laugh and dogs bark from one end of the town to the other. You can hear the town-clock tick in the steeple of the church, dripping thoughts of eternity down into the small pains and small pleasures which sigh and smile below it. And still more quiet here will it be at midnight, when the sea has couched its waves, and the birds have gone to rest, the heads put under the wings; when the linden-tree dreams and breathes out its longings through its sweet fragrance; when the houses slumber, and moonlight, the sleep-walker, roves loadless about on the roofs. Echo alone watches your steps, rising close by and far off, but only to call your erring thoughts home to your heart. Nay, how quiet here it is even on a busy morning in spring, when the old folks, opening the windows to look on the sky and prophesy how the weather will be this day, nod their blessing good-day to the youngsters who are going to their work! For quiet means peace, and peace reigns here. Look down the street on a Christmas evening, when the snow is falling like large white roses, slowly and thickly, and kisses away the sound from your steps. Candles are lit in the houses and throw broad stripes of dazzling light over the street. When rising on tiptoe, you

can look straight into the rooms. On the floor stands a pine-tree illuminated with many small, painted candles, adorned with knots of ribbon, stars of gilt paper, and small flags, and furnished with all the pleasures which the children's imaginations ever have dreamed of. In Denmark Christmas is the children's feast; and now the feast begins. The chant sounds; it is the modest, serenely smiling mother who sings. The carol follows; and then the lusty father dances with the children around the Christmas-tree. A burst of joy breaks forth; the children plunder the tree. And then—good-night!

These quiet towns you can not reach two or three times a day, rushing forth on railroads with bustle and noise. You can reach them but two or three times a week, riding in a stage-coach slowly and decently. And when the coach rumbles through the street, the gentlemen hurry to the doors and the ladies to the windows to gaze upon you. "Who was the stranger?" they cry to each other across the street, and as none can tell who you are, dear reader, they will all dress the best possible, and run to the postmaster's office in order to get a letter, which, however, has not come, and never will come. Curiosity is a passion with these people—mother of many virtues and of some vices too. Thus their hospitality is curiosity. The ancient Scandinavian hospitality is famous, and deserves its fame. Yet it was very different, for instance, from the Arabian hospitality. With the Arabs hospitality is a religious duty, fulfilled with scrupulous piety; with the ancient Scandinavians it was rather a charge of curiosity, though exercised with genuine delicacy. The guest was honored according as the host deemed him able to furnish interesting news or teach any thing worth knowing; and so it is up to this very day. Many a one, therefore, feels very disappointed when visiting one of these towns a second time. The first time, he is the subject of all attention and of much courtesy; the second time he is, perhaps, a mark for some mockery, or nobody seems to mind him. When curiosity has been gratified it turns into criticism, and the town which lately boiled on the former and evaporated into mere complacency, freezes now at once from the latter, and cracks with slander. Woe to the unfortunate fellow! His boots, his hat, his coat, his whiskers, all scandalize the quiet town; and if he happens to drop a word about the pits in the pavement, or the linden-tree barring the passage, it will certainly proscribe him from all good society. The hotel will become his only and solitary resting-place, and even the jail will look as if it were grasping at him.

The slander, however, is but a purgatory. After passing it, every one will feel well among these people. They are good-natured and trustful, frank and obliging; and though

they are very fond of their own, and very liable to be exasperated by the slightest criticism, this feeling, nevertheless, is by no means an egotistic self-love which makes the mind narrow and the heart cold. They love their own not because it is their pride, but because it is their happiness, and they defend it against every criticism not from vanity, but from gratitude. The old linden-tree they can not cut off though it almost blocks up the passage, for to their eyes it is an old friend. Dybbol's Hills were the last spot of Schleswig which the Danes possessed in 1864, and they could not hold these hills in the long-run against Prussia's and Austria's united armies and superior artillery. The defense cost every hour scores of lives. Nevertheless, the hills were the last remnants of a dear possession, and they were held not for hours, but for weeks. Silent and still went the soldiers in the morning to battle on the hills; in the evening they returned, silent and still, for then they were dead.

This sweet, tender, and fanciful love of home, the mother of puzzles and the mother of exploits, streams through the whole life, and makes it smooth and quiet. All dreadful events melt soon away by its happy warmth, and waft only as a melancholy romance over the mind. All desperate characters also dissolve by its homespun wit. It is told that the tiger, if he once has eaten human flesh, does not like any other meal, and though he can not thrive on it, but grows scurvy, nevertheless it has become his only dainty. Thus there are characters which, if they have indulged but once in excess, are forever unfit to live within the proper limits of honest life. Extravagance is their instinct, and if this instinct once has been awakened, the raptures of extravagance become a necessity to their nature, and they continue indulging in excesses of all kinds, though they know very well that this is the highway to ruin. Such characters rise in the small towns of Denmark as well as in the large cities of America; but their fates are very different. Where life is broad and passionate, they grow thieves and murderers; where it is smooth and quiet, they stop at the buffoon. At Elizabeth's court Sir Walter Raleigh reached to be a great author, and to be beheaded; if he had lived in Skiel-skör he would have been a juggler, and died by starvation. And how would Falstaff have looked if he had lived in Nyekjöbing? This huge mortar of English foolishness would hardly have grown a Pistol. Every instinct of excess is quenched, every extravagant peculiarity is pulled down, by this all-governing maxim, that the life, the very character of the son shall, in the first place, suit the home in which he was reared, and express its ideas of steadiness, honesty, and courtesy before it can be allowed to express any individual idea of his own nature.

You should see these people when hard times come upon them—when the father fails, or the mother dies, or the sons go to fight a foe ten times stronger. In the first war with Prussia (1848) the Danes had a great advantage in their fleet. The Danish fleet had never been conquered in any battle. It was the pride and the confidence of the people. It was their point of vanity, and the point was hit. Two men-of-war were sent into a narrow sound, where they were attacked by masked batteries from the shore. One of them was blown up, and the other taken by the enemy. Just when this happened there was a great feast going on in one town: the wealthiest citizen celebrated his daughter's wedding. The guests were at dinner when the stage came, and with the stage the papers. The bad news was first whispered in the kitchen, and thence it penetrated into the merry dining-room. At once all grew silent. The parson read the papers aloud. "Let us go home, children," he said: "God's hand is heavy upon us; let us go home and pray." The party separated; but the next day the town sent ten dollars for every soul within its compass to the government in Copenhagen to repair the loss.

Or you should see these people when they go of a summer night to dance in the grove. Near to the town is a handsome wood, a relic itself, the remainder of the large forests which once covered almost the whole land. It consists of gigantic beech-trees, with cool shade around their stems, and of large old oaks encircled by beautiful underwood. Paths are cut between the trees and smoothly plastered. All is finished and nice, and the young ladies will tell you which tree was the first this spring to put forth its leaves. In the midst of the wood a little pavilion is built—a wooden vault on eight stone columns, all illuminated with painted lamps. It glitters through the foliage with beams of expectation, and from afar off echo will tell you that the magnificent orchestra of the town is playing here to-night. The organist performs the parts of prime violin, and his son, a promising youth of twelve years, has the honor to second him. The bookseller, who pretends to understand poetry, and sometimes writes verses himself, blows the flute; and the jailer beats the drum with a degree of skill only to be attained by long practice. But this practice he has had. If, for example, any one wishes to make any thing known to the inhabitants, the jailer beats the drum through the street; and when people have gathered together he cries out with a loud voice that Mr. A has got five dozen of exceedingly sweet oranges from Messina, or that Mr. B has got one of the miraculous sewing-machines from New York, etc. The jailer and his drum are the advertising medium of the town. To-night, how-

ever, the drum does not call upon the ears, but upon the feet; and at eight o'clock all meet, and the ball begins. I confess that the orchestra could be better; but the melody is excellent. The waltz sounds as if it were composed just for the occasion. The roaring of the sea sounding far off, the dreams of the linden-tree slumbering in the moonlight, the beams of expectation glittering through the grove—all the romantic impressions familiar to the people are gathered together in this melody, which floats gently through the air. It sounds without, thrilling to the ear; it sounds within, exciting to the heart; and, as if taken by some magic spell, the limbs begin to move according to the rhythm of the music. I confess, too, that the company could be better: the ladies could be fairer, and the toilets finer; the gentlemen more elegant, and the conversation more spirited. But the gladness is genuine, and the mirth joyful. When looking at these dancing youth one would think that dancing was their only business; and the elderly gentlemen and ladies, who sit around drinking wine or coffee, seem, indeed, to think so. Still they watch very closely that all shall be decent, and no "tiger" be let in. The only make-bate in the company is Cupid, the beast, who lurks behind some column, and flings his arrows by the dozen in every direction.

At midnight the ball is over, and people go home, hand in hand, along the sea-shore. On one side the moon builds its silver bridge upon the rippling waves, and invites fancy to step over into the fairy-land of leisure and romance; on the other side the church lifts its grave steeple, and tells the heart to keep close to the house of duty and truth. But how gently are romance and truth blended in this moon-lit scene, and how gently are the joy of to-night and the duty of to-morrow blended in these harmless hearts! All is so quiet! The loungers turn homeward; the dreams come nearer; the town is going to sleep, and so, I fear, is my patient reader.

MISERERE.

A SONNET.

I THINK the pity of this earthly life
Is love:—So sighs a singer of the day,
Whose pensive strain my sympathetic lay
Sadly prolongs. Alas! the endless strife
Of Love's sweet law with cold Convention's rules;
The loving souls unloved; the perfect mate,
After long years of yearning, found—too late!
The treason of false friends; the frown of fools;
The fear that baffles bliss in beauty's arms;
The weariness of absence; and the dread
Of lover—or of love—untimely dead!—
Musing on these, and all the direful harms
That hapless human hearts are doomed to prove,
I think the pity of this life is love!

JOHN G. SANE.

THE LITTLE SAINTS.

WANDERING around the world in the enforced idleness resulting from overwork in a laborious profession, I found myself in the island of Pico just as the vintage season commenced, and resolved to remain there for some weeks at least.

Accommodation, as innkeepers understand the word, there was none; but the means of life were to be had; and with a little trouble I succeeded in hiring a small house, the landlord kindly throwing in the services of a couple of sheep, who were driven through the various rooms before I entered, that the fleas might involve themselves in their heavy fleeces, and so be carried forth to "green fields and pastures new." A bedstead of domestic manufacture, a sack of striped tow filled with fragrant heather, tow sheets, and coarse blankets, with my own traveling plaid for counterpane, a few chairs, a table—at least I think it was a table, but it might have been almost anything else—some gaudy crockery-ware and a spoon and fork from my dressing-case completed my housekeeping arrangements. Besides these I had Tia, Pataco-falso, and Carochó; the first being a woman, old, ugly, and useful, her true name being lost in the mist of ages, and her title of Tia, or aunt, belonging also to every woman of her years and station living beneath the Portuguese flag. Of Pataco-falso's baptismal and family names I am equally ignorant, nor could I ever ascertain how he came by his *sobriquet*, which means a bad copper five-cent piece. But he did not strike me as likely to have been a coiner, or, in fact, any thing else arguing any amount of skill, or the possession of a brain, being simply a long-legged, swarthy lad, with a shock of black hair thatching a Murillo-like face, expressive of nothing but stolid simplicity and animal good nature. With all his simplicity, however, he got the better of my traveled astuteness, and concluded a bargain for his services during my stay in Pico at the rate of fifty cents per day, before I discovered this sum to be a little more than twice the current rate of day wages for a laborer in that favored isle. His principal duty was that of attendant upon Carochó, or the Cockroach, this third and final member of my household being a small and very curly donkey, whose strength and endurance of body were only excelled by the vicious perversity of his temper. His equipments consisted of a huge pad in shape and size resembling a feather-bed, over which was tightly strapped a wooden frame, suggesting the first vague germ of our modern saddles; upon this was laid a cushion of red calico filled with some sharp-edged substances, possibly pebbles, possibly chips; and over this again was thrown a gay striped blanket, whose usual fate was to slide gently to the

ground in the course of the first hour's journeying. Upon the throne thus constructed sat Carochó's rider, his two feet dangling stirrupless at one side, the reins looped to the *andilhas* of the incipient saddle, upon which also rested his hands in the imbecile fashion peculiar to this mode of equi-, or, perhaps, asi-tation. Behind walked or trotted Pataco-falso, armed with a long stick, supple, strong, and heavy, the end provided with a metal tip sharpened to a point, and with this stick and this goad were the unfortunate Carochó's sides, haunches, and flanks so intimately acquainted that I sincerely hope use had with him become second nature, and that he no longer suffered from the infliction.

I have said that it was the vintage season, and this in Pico means the bluest sky and sunniest sea of the year, and delicious fragrance of grapes, figs, bananas, and many another fruit ripening between the sunshine and the hot black lava soil; it means the hum of bees, the song of birds, the chirping of insects, the gay shouts of men, and the tinkling laughter of girls as they pursue their happy toil in the vineyards, or come stepping down the stony paths toward the wine-press, the heaped baskets of grapes poised easily upon their heads, and their full, stately figures swaying gracefully beneath the fragrant burden. And the grapes! Small and amber-colored, they seem still to glow and taste and smell of the fierce sunshine which has ripened them, each little globe containing the essence of a summer day. But no amount of description really describes beauty, whether of place, person, or thing; so leaving the scenery, the girls, and the grapes behind, I go on to my story, for I have one, and a curious one.

It was toward night of a delicious day that we—that is, I, Pataco-falso, and Carochó—were dragging wearily home after a long ramble among the mountain paths, and found ourselves by chance upon a road new to me, but commanding so remarkably fine a view of the bay and of Fayal that I tugged at the donkey's rein, shouting, "E-e-e! Venha cá!" desiring him to pause and allow me to enjoy it; but my attendant interposed in his peculiar English.

"Oh, senhor! No good here! Come along down very quick! Passa-ca-asno!"—the last phrase addressed to Carochó, and accompanied with a dig of the goad which caused that worthy creature to lash out behind with great vigor and animosity.

"E-e-e-e! Be quiet, you brute! What do you mean, Pataco-falso? Why isn't it good here? What's the matter?"

"Os Santinhos! No bon, no good! Come down, senhor." And Pataco-falso, crossing himself vigorously with one hand, pointed with the other toward a rough wall twelve or fifteen feet in height skirting the road for several hundred yards in front of us.

"The Little Saints!" repeated I, staring at the wall, which, built of masses of black lava laid in dark mortar, suggested no more saintly idea than that of a garden or vineyard carefully protected from the furious winds of spring.

"Little Saints! where are they? what do you mean, Pataco-falso?" repeated I; while Carochó, inspired by some private hint from the goad, indulged in another fling with his heels, and then set off at a pace that left me no breath for more than laughter until we had so far passed the gloomy wall that my desire to remain in its vicinity had become of no avail. Then, and not until then, did my cunning attendant allow Carochó to subside into good behavior, and me to find breath and opportunity for addressing him. My first remarks were naturally of a reproachful nature, but failed so completely in awakening that moral sense in which, I fear, Pataco-falso was totally deficient that I soon abandoned them, and, reverting to our original subject of dispute, demanded the meaning of my servant's abhorrence of the black, high wall, and why he had given it the title of Santinhos, or Little Saints. For some time I could get no answer but,

"Oh, senhor! Nas é bon, it is not good; very bad place; not good to talk about," etc., etc.; but by judicious questioning, some wholesome severity, and the present of a cigar, I at last extracted the information that behind the wall was a house built by a rich man from Fayal, who had lived there in a very secluded manner with his young wife, and three children who were supposed to be his own, although other reports made him only their guardian. In course of time the children died, and were buried somewhere within the grounds, and a sort of mystery and terror began to settle over the place. The servants, who had come from Fayal with their master, never appeared outside the walls, and such supplies from the village as were required were taken in at the gate by a steward called Maestro José, who never encouraged either gossip or delay on the part of the messenger. But one morning all this came to an end; for as a party of mountain villagers were passing the great red wooden doors which alone gave access to the estate, one of them was violently pulled open, and a white-clad, barefooted woman rushed out shrieking fearfully, and always, as she ran, turning her head to look over her shoulder like one pursued. Behind her came Maestro José, his face white and stern, his hair streaming in the morning breeze, his whole air disordered and terrified. Seeing the peasants, he stopped short, and pointing to the flying figure, now almost out of sight, he said:

"Go after the poor senhora and bring her back: she has lost her wits, and no wonder. My master is dead, and she was with him, she and the—"

Then he stopped, and not another word would he say, nor would he allow any of the party to step inside the great red gates, which, indeed, he locked, and put the key in his pocket, remaining on the outside himself. Two of the young men set off in pursuit of the unfortunate senhora, and about half a mile from the gate found her lying beside the road in a deep swoon. They brought her back and delivered her to Maestro José, who, without a word, took her in his arms and carried her inside the gate, which he again locked in the faces of the little crowd outside.

Three days more went by, and then Maestro José sent for the priest of the next village to bring the sacrament to a dying person. So much was known; for the whole village saw the solemn procession, and, indeed, most of them followed it; but at the garden door stood Maestro José waiting to receive them, and so soon as the padre, with his attendants and the holy symbols that they bore, passed in, he slammed the gate and locked it as fast as ever.

When the priest again appeared some of the more influential of the villagers ventured to make inquiries concerning his visit, but were only informed that the senhora was *in extremis*, and the senhor already buried. Two days more, and again Padre Xavier was summoned within the close-mouthed gates, and this time to bury the unhappy woman whom he had shriven a few hours before. After this Maestro José, with all the rest of the servants, returned to Fayal, and by the next opportunity took passage for Brazil, where a certain property had been bequeathed to them by their late master.

After this the place remained closed, and although known to belong to a family of Fayal, had never been visited by any member of it, so far, at least, as Pico information went.

"But why the name of Santinhos, Pataco-falso?" inquired I, as my retainer paused in his story.

"Because, senhor, of the pequeninos, the little children of the wicked Senhor Francisco."

"What of them? Come, Pataco, here is another cigar; light it, and tell me the rest of the story: the smoke will keep off the 'diabos' that you are afraid of."

Crossing himself fervently, and glancing over his shoulder as if expecting the imps referred to were already at his heels, Pataco took heart of grace, and in a lower voice and yet more earnest gesticulation than he had yet used, he told how a party of young men from the village, moved partly by curiosity and partly by a hope of picking up some little matters of property that might have been left behind in the sudden removal of the household, had scaled the wall, and were on the point of entering the house, when one of them, left on watch, had seen the figures

of three little children, all clothed in shining white, and with a light like that of the rising moon about their heads, come out of the closely shaded path leading to the garden, and, mounting the terrace, disappear within the house; much frightened, he was hastening to warn his companions, when from within the thick walls of the building rang out such a shriek, in the shrill voice of a woman, that those who heard started back as if shot, and then, tumbling over each other, fled hastily down the steps, and through the grounds and over the wall, never pausing until safe out of sight and hearing of the unlucky spot.

"For, senhor," whispered Pataco, laying a finger upon my arm and opening his glaring dark eyes very wide, "at the back of that garden is where Maestro José buried those three babies, and from there they come every night to meet those that—eh, eh, senhor, it is not lucky to talk much of these things; but now you see that because they were so good, and so unfortunate—not to mention having shining things round their heads, and white clothes like the little Jesus in the church—we call them the Little Saints, and the house the Casa da Santinhos, which is surely better than to give it a bad name, is it not? Adios, senhor."

"Adios—good-night, Pataco-falso," replied I, absently; and so soon as my valet had left me I lighted yet another cigar, and quietly letting myself out of the house, strolled away in the moonlight. At first I walked along without any definite plan, merely enjoying the warm, dry air and splendid radiance of the sky while musing over the story I had just heard. Presently, however, I found myself upon the road to Os Santinhos, and without really knowing why I should wish to put myself to so much trouble and fatigue, I resolved to keep on, and take a closer view of the place than I had as yet been permitted to do.

The distance of about three miles was quickly passed, and before midnight I found myself beneath the high black wall at the point where it made an angle with the side wall, which was not nearly so high, as it only divided the grounds from a neighboring vineyard. Over this side wall I decided to make my entrance, and at some little distance from the road I selected a favorable spot; and with some scrambling, the sacrifice of a pair of boots and a good many stones out of the wall, I found myself upon the top, and by the help of a convenient chestnut-tree let myself down upon the other side. The house stood before me, white and ghostly in the moonlight, the latticed windows of the upper story without shutters, but those below entirely covered. A balcony ran around three sides of the house, and upon it these upper windows opened after the manner of doors.

"Since I am here, I may as well see the whole," muttered I; and mounting the steps leading to the terrace, I walked slowly around the house, looking for some means of entrance below or for a convenient point of ascent to the balcony. I had passed around the moonlighted sides, and was entering upon the darkest part of my journey, when a faint scream close at my elbow was followed by the fluttering sound of a woman's garments and the fall of rapid feet, as a dark figure rushed past me and out of sight in the direction of the gate.

I do not lay claim to any more courage than is common to my sex, but I may safely say that to startle me in this fashion is not the way to dissuade me from any pursuit, and I was now more than ever determined to explore the ill-omened house before me; so, after a moment's pause, I kept on, peering through the gloom at the wall as I passed in search of a door. About half-way to the next angle I saw one, and turning the handle, found to my great surprise that it yielded to my hand, and admitted me at once to the sagao, or cellar-like entrance hall common to all Azorean houses of the better class. Here I stopped to strike a light by means of my pocket match-case, which, much to my vexation, proved to contain but two matches. One of them I drew across the stone wall, and as it flashed into light I held it above my head and stared about me. It was a low, wide hall, supported by stone pillars, and of indefinite extent. Many doors opened at either side, giving entrance, no doubt, to store-rooms and cellars; and at the far end another, which, even as I looked, opened slowly from within, letting out a faint streak of light, and showing a white figure standing motionless upon the steps inside. A sort of thrill ran through my body—perhaps it was fright; I do not know; but, at any rate, my next impulse was to rush forward through the dim vault toward the open door. As the sound of my feet upon the stones woke the gloomy echoes of the place, the figure turned and fled up the stairs, silently and swiftly as a cloud; but the door remained open, and, guided by the light, I pursued as swiftly. The stairs terminated in a long corridor running through the house and pierced with many doors. One of these was just swinging together as I reached the landing, and rushing forward, I pushed it violently open. A faint sound, a sort of gasping sob, greeted my entrance, and in the dim moonlight that filled the room I saw the white figure flit through another door at the far end of the place. Leaping forward, I laid my hand upon the door before it could be closed, and pushed my way into the small chamber behind it. This, lighted only by one window, and that at the north, was yet darker than the other room and the staircase, both of which received the full light of the moon;

but still I could discover the shadowy white figure, no longer flying, but crouched in the farthest corner of the room, the head bent down, and the face hidden by the hands.

"At last!" exclaimed I, rushing forward and laying my hand upon the bowed head. I had so fully prepared myself for the shock of feeling nothing beneath my fingers that I really experienced something of terror in finding a real head; and it was only with an effort that I returned to my usual prosaic mode of thought, and regarded the figure before me as that of an ordinary mortal, apparently a woman, and one who, perhaps, had a right where certainly I had none. Filled with this last idea, I was beginning some sort of apology both for my presence and my conduct, when to my dismay the drooping head drooped still farther, the figure swayed sideways, and it became evident that the fugitive had fainted as she sat.

"Proved that it is a woman, and mortal; but what am I to do with her?" muttered I, in all the perplexity of a bachelor. Remembering that fresh air and cold water were always alluded to in romances as appropriate restoratives, I dashed open the window, dragged the unconscious figure close beside it, and collecting in my hand some drops of water still standing in a hollow of the stone balcony after the morning's shower, I sprinkled them in the white face, which I began to notice was very young and something more than fair.

"The deuce! a young lady! What a mess!" thought I, in comic despair, not lessened by perceiving that my patient was reviving. It was a very pretty sight, no doubt, to watch the dark eyes as they slowly opened and turned languidly from side to side, while the faintest color came back to the charming mouth, and a little warmth crept into the cheek upon which I respectfully laid my fingers. But all these signs only heralded the moment I already dreaded, when with a sudden start, as the tide of memory came rolling back upon the brain, my pretty patient attempted to rise, and murmured,

"What is it? Jeronyma, is it you?"

The plunge had come; and drawing a long breath, I remarked with as judicious a mingling of respect and benevolence as I could manage upon the moment,

"Pardon me, senhora, but—"

A scream cut short my sentence, and, rising to her feet with an elastic motion not to be acquired by the Northern races, the fair Portuguese turned a face both frightened and angry full upon me, and exclaimed,

"Senhor, I do not know you! What have you done with Jeronyma? Where is my servant?"

"If Jeronyma is the individual whom I just frightened off the terrace below, I should say that she must be nearly at Magdalena by

this time," replied I, a little nettled at the haughty tone of my recent patient. Like a shuttlecock it came to me the next instant.

"And might I inquire, senhor, why you should frighten away my servant, and pursue me, and, above all, what you are doing in this house?"

"Minha senhora, these questions are at once too just and too severe to admit of a reply. Suffer me to offer my humblest apologies, and to take my leave."

So saying, and with a bow of exaggerated humility, silently returned by the dim figure I addressed, I backed out of the room, and slowly retraced my steps to the staircase. No sooner had I left the presence of this mysterious lady than I began to repent my precipitation; and while I wondered more than ever what her business could be in this lonely and ill-omened house at midnight, I doubted whether as a gentleman I was right to leave her to its terrors, even at her own request.

"If only she hadn't been so confoundedly arrogant I would go back and try to persuade her to return to Magdalena with me," muttered I, halting as I reached the sagao. "But no, she would only snub me again. I will go and look after Jeronyma instead. She will be coming back by this time."

So saying, I lighted the last match, and by its glimmer found my way to the outer air. Passing along the terrace, I could not resist the temptation of going around the house to its northern side and glancing up at the farthest window. As I did so a shadowy white figure drew silently back into the gloom and disappeared.

With a smile upon my lips, kindly hidden by the darkness, I made my way to the outer gate, which, as I expected, was not only unlocked, but standing wide open; and, taking the road toward Magdalena, walked rapidly on, until, gaining a rising ground, I stopped and scanned the track for a considerable distance in advance. No living creature was to be seen or heard, and I turned to look back at Os Santinhos. House and grounds lay bathed in the quiet moonlight as I had first seen them; but was it that my nerves had become excited, or did the light fall differently? At any rate, there was a change; the whole place had taken on a weird, unnatural appearance; the moonlight glancing from the windows looked like flames, the shadows seemed like moving crowds of living creatures. At that moment, and for the first time, a feeling of horror in connection with the place took possession of my mind, and prompted flight. The next instant came the revulsion of reason, and with it a feeling of self-reproach that I had abandoned, even at her own demand, a young girl to the loneliness and terrors that already assailed my stronger nerves.

I made a step toward return, then checked

myself. "She will ask again what business I have in following her," said I to myself; and still was hesitating, my eyes earnestly fixed upon Os Santinhos, when I saw—and as I am a living man it is the truth—a cloud, or rather a body of light, issue from the rhododendron walk leading from the back of the house into the garden. I rubbed my eyes and knit my brows, determined not to be made the fool of an excited fancy; but still the shining cloud moved on, slowly advancing toward the house. And now I began to distinguish forms moving within it. One, and two, and three! Yes, three figures, as of children walking hand in hand, all clothed in shining white, and all looking earnestly toward the house as they moved slowly and steadily toward it.

"Os Santinhos!" muttered I; and, with no further hesitation, I sprang forward at a run, no longer doubting that it was my duty as well as my earnest desire to share the vigil of that haughty, dark-eyed girl, and shield her so far as mortal might from the terrors of this haunted house. The distance may have been a quarter of a mile or less; but from the first step I lost sight of the house and grounds, nor caught another glimpse of either until, breathless, excited, and strangely moved, I rushed through the red door, still standing ajar, and on between the dew-dripping hedges to the house. As I came in sight of it I paused a moment, partly to recover my breath, partly to note what changes had taken place since my departure. But still the house lay cold and white in the moonlight, the lower half close barred, the upper casements dark and forbidding, save when they flashed back the flame-like light. The cloud, the three childish figures, were nowhere visible; and a doubt whether I had not deceived myself in seeing them at all flashed across my mind, and brought a smile of self-contempt to my lips.

"At any rate, I will go in again, and, braving the fair donna's disdain, will offer to escort her back to the town; for it certainly is not agreeable to spend a night alone in such an old ghost-trap as this, whether—"

A sudden shriek cut short my unspoken words, and sent a thrill of horror through my nerves. Such a sound of terror, of despair, of madness, I never heard before or since, and never while I live will it cease to haunt me. Without an instant of thought or hesitation I sprang up the steps, rushed around the house, and seizing the handle of the door which I had closed in coming out, I turned and shook it violently, but without result. She had followed me down, and fastened the door behind me. I threw myself against it with all my force, and again and again, but the solid oak and iron met me like a rock. I stamped and ground my teeth with rage, rushed up and down the terrace like a madman; then, controlling myself with a violent

effort, I tried to think—for up to this point I had been guided solely by impulse. A moment did it; and running around the house until I stood beneath the window I had opened to give air to the fainting girl, I seized one of the carved pilasters which ornamented the wall, and by violent efforts succeeded in clambering up until I could touch the stone floor of the balcony, which, as in all Azorean houses, was formed by the projection of part of the wall of the house, and not supported from below, as in American country houses.

The floor attained, I easily grasped the railing, and drew myself up and over. The window still stood open, but the little chamber was empty, and I passed hastily through it into the next, and still finding no one, went on to the corridor at the head of the stairs. Standing here in the darkness, I listened intently for a few moments, then groped my way on toward the dim window at the farther end. As I did so some one passed me; some one who was in great grief and terror; some one from whom emanated a horrible chill and a sense of repulsion that made me shrink away until I stood pressed against the wall. I tell this incident thus vaguely, for it was thus that it occurred, and this is all that I know of it. I saw no one, I heard no one; but yet I knew that in the dead darkness of the place some one—a woman as it seemed to me, a woman overcome with some terrible grief and fright, and bearing about her an atmosphere of creeping chill and horror—passed me and went away out of the house; for after a minute or so I drew a long breath of relief, and felt that a weight was lifted from my brain which would have driven me mad had it been suffered to remain there.

In the same way that I had known that this woman passed me, I knew that it was not the woman I had seen in my first visit to the place, and I now felt more than ever determined to find and rescue her. Listening so intently that the tympanum of my ears tingled with the strain, I heard the low sound of a whispering voice in a room at the end of the gallery, and as noiselessly as possible I groped my way toward it. The door stood half open, and the last rays of the moon, already sinking, threw a strange, cold light into the desolate chamber. Just where this light fell upon her head knelt the girl whom I had already seen, a crucifix and rosary between her folded hands, her great dark eyes uplifted and full of tears, her face white and cold as marble. It was the whispered words of her prayer that I had heard; and so rapt was she in her devotions that she had not perceived my cautious footsteps. Seeing her safe, and thus occupied, I hesitated to intrude, and finally contented myself with remaining where I could watch over her without being myself perceived. The moon sank lower and lower, and the "dark hour before

dawn" came on. Then, in the dim twilight, I saw the kneeling figure sink down exhausted, while the rosary fell rattling to the floor.

"O Jesu! Is it not enough?" moaned the broken voice; and then—"it is so terrible here!"

At that I dared to act, and pushing open the door, I entered the room, saying, as I did so,

"Senhora, once more pardon my intrusion, but—"

"You, senhor! You again! Is it really you, a living man?"

"It is I, senhora; and I have dared to return because I felt that this place and this time were enough to terrify me, were I compelled to remain alone here, and I did not suppose you to have more courage than myself."

"I had courage because it was a duty, senhor," replied she, coldly; and then came a silence, and then a smothered sob, and then the weary, broken voice, no longer proud or cold, moaned out:

"Oh, take me out into the light; take me away from this fearful place, senhor, if, indeed, you pity me, as you say."

I do not remember what I replied to that; but as I close my eyes I see again, as I saw then, the slender white figure defined against the casement coming toward me with pleading, outstretched arms, and again I feel the ice-cold little hands that grasped mine so convulsively as we met midway.

"You are safe now. Come!" said I, and, still holding her hand in mine, I led her, wildly sobbing now that her strained nerves had given way, through the corridor and down the stairs and through the tomb-like sagao, until we stood beneath the free, pure heaven, already rosy with the coming dawn.

Upon the broken terrace steps she sank down utterly exhausted, and unable longer to control or exert herself. I stood beside her, silent, while the violence of her emotion lasted, but when the stormy sobs grew less frequent, and some murmured words of apology became audible, I seated myself, and, in such phrases as I could best choose, I assured her of my sympathy, my anxiety to help her, and my regret at having appeared to intrude upon her privacy. But here she interrupted me, saying, hurriedly,

"I owe it to you, senhor, to explain why I am here—"

"By no means, senhora; it is I who owe you both explanation and apology;" and, hurrying on, I told her my little story precisely as I have told it to the reader. In the ghostly light of early morning I could see her proud face grow yet paler, and her large eyes dilate and waver, as I spoke of the strange presentiment, the stranger sights and sounds, that had led me back to her when already I was far away; and when I told of the Presence—the Thing—that had brushed

by me in the corridor, she shrank closer to my side, and laid her icy hand in mine.

"I saw her! I heard her!" whispered she.

"It was then that you shrieked, was it not?"

"I did not shriek. That was her, not me—that is the shriek with which her wicked mind fled from its body, and she rushed out to die."

"She?" asked I, my curiosity overpowering my discretion.

"Yes. My grandfather's wicked young wife. Senhor, you have told me your story; now listen to mine:

"Senhor Francisco —, who built this house, had a younger brother, who went to Brazil and gained very much money there. Dying, he sent his three little children, whose mother was dead before, to his brother, and with them the papers that proved their right to all his property, both in Brazil and here in the islands. Senhor Francisco had also married, and also lost his wife, who in dying left him one child, afterward my mother. He was angry that this daughter was not a son, and while she was yet little he sent her away to grow up among the peasants of one of his country-seats. Then he married a beautiful young wife who brought him yet more money, and by whom he hoped to become the father of sons who should inherit his wealth and his name. It was soon after this that the little orphans with their great fortune came to him from Brazil, and the father of evil put it into his heart, or rather into that of the wife, to kill them and become their heir.

"This house was just built then, and had never been used, for, you know, we Fayalese only come to Pico for the summer months; so it surprised no one when, early in July, my grandfather with his whole family came over here, and began to live so quietly that after a while it was like a prison: no one came in and no one went out. The only life was the sports of the poor little children, and little by little they seemed to lose all heart for play, and went creeping about hand in hand, sitting for hours in the garden, or hiding in the thicket behind it; for although the house was new, the garden had been made a great many years, and was already old."

"But, senhora, how do you know all these details of a time so long past when you were born?" asked I, curiously.

"It was only two months ago, senhor, that I heard them from the lips of an old, old man who came home from Brazil to die in his native place. He was called Maestro José, and was my grandfather's *feitor*—what you call in English steward. He had grown up in the family, and knew all its secrets; indeed, I do not think my grandfather tried to hide any thing from him. So, in return—

ing to Fayal, he came to the old house where he had grown up, and where, alas! I now live all alone—for, senhor, I am an orphan—and after a few weeks the poor old man fell sick, and they told him that he must die. Then he asked to see me all alone, and told me this story, and said that it had haunted him in his far-away Brazilian home, and he could not rest there, but had come home to tell the story to my mother if she had been alive, but, failing her, to me; and—but stop! I will finish the story, and then I will tell you how the promise which I gave to José brought me here to-night.

“So—José went on to tell me—the little children moped and pined, and the wicked young wife watched them with sidelong, eager eyes, like a cat who waits for the bird to be quite within reach before she springs; and my poor grandfather wandered up and down the house, wasting to a shadow with the struggle that went on within his heart; for, oh, senhor, I am of his blood, and I do not wish to think that he was wicked of himself: it was she that made him so.

“At last, in the hottest part of the summer, the children fell ill with some slight childish complaint, and they lay in bed in the room where you found me praying. It was in the night that José heard movements in the house, and, rising from his bed, came softly along the corridor, just as you did last night, senhor, and standing at the door, peeped in, still as you did, but the sight he saw was different. The children lay sleeping in their little beds close together, and my grandfather and his wife bent over them; she with such a dark, determined look upon her face that old José said his hair stiffened upon his head, and a chill of death crept over him, and he (my grandfather) holding her back and whispering in her ear. But all at once she tore herself away from him, and snatching up a pillow pressed it upon two of the little heads lying close together, and held it down so tight—so tight—that in a few moments the poor little limbs ceased to struggle, and the murdered children lay very quiet.

“The youngest, the baby, a pretty little curly-haired darling not three years old, waked as she went toward his little bed, and, smiling up in her face, held out his arms to be taken. She hesitated one moment, and my grandfather cried out,

“‘Not him, Thereza; not the poor little Francisquinho!’

“But she looked at him with her great fierce eyes, like a wolf, and saying, ‘All or none, my husband,’ she crushed the pillow down upon the little sunny head, and bent like a black shadow of death over the poor little struggling form. Then José crept away as he had come, and went to his own room, but had hardly been there an hour when a servant came to call him. The

children had died, and the master was very ill, all of some dreadfully contagious disease, he said, and the mistress was calling for Maestro José.

“So he went, and listened to her story, and said nothing, but set himself to watch over his master, who was raving in delirium already.

“When morning came he buried the three poor little babies in the thicket at the back of the garden, where they had tried to hide from the foul death that was pursuing them; he buried them, and said nothing, for was not my grandfather’s safety and honor more to him than his own—more than the law, or even revenge upon that wicked woman?

“Two days more and my grandfather was dying. In the last hours his senses came back to him, and he confessed all to José, with the wife standing by and mocking at every word he said, for already her mind was wandering. But my grandfather, not heeding her, told the whole story; and he gave him a sum of money and jewels, and bade him carry all the servants with him and go to Brazil to spend the rest of his life, lest the secret should ever escape his lips; and he gave him the deeds of a small estate there, writing with his own dying hand that they were to be made over to him forever. Then he made José carry him into the chamber where the children had died; and when the night came round again, and she was watching beside him with her fierce wolf-eyes, he died. It was at that moment, senhor, that they first came.”

“They?”

“The children, the Little Saints, as the people call them. José saw them standing at the foot of the bed, and looking so sadly, so piteously, at the dying man that he felt they were forgiving him the cruel wrong he had permitted toward them. He saw them too, and starting up in his bed with a great cry, he threw out his hands as if to keep them off, and fell back—dead. And she—she saw them, and it was then that she uttered that terrible shriek whose echo you heard last night, senhor. It was when she saw those three, and knew that they were to haunt her forever through all her miserable life, that her senses gave way, and with that dreadful shriek she rushed out of the room and out of the house, and fled through the gate, and José after her. When they brought her back he took her into the house, and laid her upon her bed, and locked the door upon her, while he went to look at his master, but he was already dead and cold. So when night came he went for the priest, and my poor grandfather was buried—but not with the rites of the Church, for, alas! he had died in his sins, unshriven and unforgiven. There was no inquiry into his death or that of the children, for my grandfather was very rich, and the priest and the

mayor were very poor, and José knew how to manage them. The next day the padre came again to bring the last unction to the dying woman; and when all was over José collected the frightened servants, whom he had kept in the farthest part of the house all this time with talk of deadly contagion, and carried them over to Fayal, and a few days after they all sailed together for Brazil. Then the property all came to the poor neglected and despised little daughter running barefoot among the peasant children at Conceição, and she had a guardian, and was educated, and grew up and married, and she and my father died three years ago, and I am all alone in the world, senhor. You see that, as the priest says often happens, the sins of the fathers are punished in the children, and I suffer for the wickedness that was done here forty, almost fifty, years ago. So, senhor, when José had told me all this story, and begged me to do something to ease his dying moments, I promised that when the anniversary of that cruel night came round I would visit this place, and spend the night upon my knees praying for the souls of those who died so fearfully here; and the old man smiled and closed his eyes, and never spoke again. I told my confessor of my vow, and he said it was a holy one, and he promised to spend the night in praying that I might be prospered in my pious task; and I gave him money that masses may be said for a whole year in the little chapel upon one of my estates in Fayal, and so I think I have done all that I can; have I not, senhor? But it was very terrible, and I am so glad that you came, although you frightened me so much."

"But, senhora, did you actually see any thing supernatural last night?" inquired I, as she paused.

"How can I tell, senhor? I heard something. I knew that some one was near, and I fixed my eyes upon God's clear sky, and prayed to Him as fervently as I could. At last I heard that awful shriek, and the next thing was your voice. But see! there comes Jeronyma; she is my old nurse, senhor, and she came to watch with me last night. We are staying at a house that I borrowed of a friend in Fayal, so that I might keep my vigil without exciting remark. I will go to meet her. Adios, senhor."

She rose, and, making me a stately and graceful reverence, was already moving away, when I arrested her.

"But, senhora, may not I hope to see you again? May not I ask your name?"

She hesitated a moment, then said:

"A young woman like myself can not receive a young gentleman as her guest among us Portuguese; but I am called Senhora Donna Katrina, and if you are ever in Fayal, it may chance that we shall meet at the house of some mutual friend. Adios, senhor."

"Adios, minha senhora. We shall meet again."

So ends the story of Os Santinhos, but not the story of Donna Katrina and myself; for that is not done yet, and my daily prayer is that it may not be finished for many, many years.

THE GROWTH OF OUR THEORIES OF THE WEATHER.

IN the traditions of almost every nation whose history runs back to a traditional period there is an account of some divine messenger to whom their fathers were indebted for a knowledge of agriculture. The origin of such a tradition is evident enough. It seemed in those early days the only explanation possible to account for so great an advance from the poverty, uncertainty, and anxiety of a life dependent upon the finding of such roots and fruits as nature might fortuitously afford, to the security and ease implied in agricultural pursuits. From the first rude attempt at agriculture, however, up to the present complicated scientific condition of that industry, we know that all our advance has been gained by the patient process of experience and thought. Analysis, synthesis, and comparison, the only methods we have for arriving at truth, have given us our theory of manures, the rotation of crops, and demonstrated the advantages of draining, or of subsoil plowing.

Some divine messenger may have brought the crooked stick which served as the first plow; but we know that the steam-reaper was so much of a human production that we have granted a patent to its inventor, as a reward for the thought and labor he expended in making it. With the aid of chemistry, accuracy and precision have been introduced into many departments of agriculture, and, in place of the old empiricism, we have the certainty of scientific knowledge. The cultivation of the earth as the primal and chief business of mankind, forming as it does the very corner-stone of social life and social progress, we find is aided and improved by increase of human knowledge in any and every direction.

The farmer of to-day is not only called upon to expend the sweat of his brow in earning his bread, but he finds that he must also tax his brains. The strength and endurance of his muscles will not come amiss; but the breadth and scope of his general knowledge, the accuracy of his observation, and the fineness of the tissue of his brain are of more importance still. Nor is the end yet reached. We have applied science to the study of the chemical constitution of the soil; we can tell what elements the manures we apply must have in them to produce certain results; we can decide upon the needed moisture of the land, and regu-

late it by draining; but for all the influences upon the crops we desire, which the summer's rains or droughts, the early or late frosts, the chill or heated terms, may have, we are helpless, and have to depend upon such conditions as the natural course of events may bring for us.

We are almost as far from knowing that the atmosphere can be cultivated and the climate regulated as our savage forefathers, who lived upon such roots and fruits as grew spontaneously, were that the soil itself could be brought under their control. In this case, as with agriculture, it is only as increase of knowledge gives increase of power that our conception of our domain over nature widens; and an examination of the gradual growth of our theories of climate will show that it lies as directly in the path of human progress to apply scientific knowledge to the regulation of the wind and the rain as it has been to modify the soil.

Meteorology, though by no means as yet an exact science, has taken its place in the scientific advance of the century, and has reaped the benefits which all special branches of investigation have reaped from the new spirit of positive inquiry which characterizes the present scientific thought of the world. A century ago it was impossible that any thing like a general theory of the climate could be made, since there were neither the data in existence upon which to form such a theory, nor was mankind in possession of the means for arriving at such data. The students of the weather could rely only upon their individual observations; and to our, as to their, unaided senses it appears as though nothing could be more capricious than the weather; as though sunshine and showers succeed each other with no regard to rule or reason; as though the wind blows where it lists, and brings heated or chill terms with it as it wishes.

The barometer, however, first enabled us to measure and record the pressure of the atmosphere, and note its changes; then the thermometer enabled us to do the same thing with its temperature; then the investigation of the electric phenomena of a thunder-shower robbed the lightning of all its terror as the manifestation of some angry divinity, by showing that it was the natural operation of a force diffused through almost all the processes of nature.

The effect of these discoveries, affording the means of a more extended and accurate observation of nature than the world ever before possessed, led naturally to an increased interest in the study of meteorology, and this, in turn, produced further means of investigation. Neither the barometer nor the thermometer was found adequate for giving us all the data we needed concerning the condition of the atmosphere at any moment. There are other conditions upon

which the chances of rain or drought depend. Not only the weight and the heat of the air are important to be known, but also its comparative moisture, and its electric condition.

For obtaining these data we have also instruments. The tests of the electric condition of the air, whether positive or negative, and also how strongly it is charged, or, as the phrase goes, what is its electric tension, are numerous but delicate, and can hardly be used except by experts. That, however, of the comparative moisture of the air is very simple. It consists simply of two thermometers placed side by side; the bulb of one is left exposed, while that of the other is covered with a bit of muslin, the end of which hangs down into a cup of water. The effect of this arrangement is that the muslin enveloping the bulb is kept moist by capillary attraction. If, therefore, the air is dry, and absorbs moisture, the water in the muslin on the bulb evaporates quickly, and in this process absorbs heat from the quicksilver in the bulb, thus causing the mercury to descend. If, however, the air is moist, the muslin retains its water, and the mercury is not affected by it. The difference or similarity of the reading of the two thermometers is, therefore, the test of the moisture or dryness of the air.

The simplicity and value of this instrument as a weather gauge should bring it into almost universal use. In indicating the weather it is more reliable than any other instrument which we have as yet, and, furthermore, as we shall see, has had an important effect in modifying our theories of rain.

Besides these instruments, we have others for measuring the force and direction of the winds, the amount of rain and snow which falls, and, finally, the telegraph is coming rapidly into use for the purpose of instantaneous intercommunication between distant points. By its aid, for the first time in the history of meteorology, it becomes possible to follow a storm in its entire course, noticing its commencement, its course, its changes, and its end. The effect of thus extending our powers of observation and introducing accuracy into our measurements of the various elements upon which our climate depends, has been the same in the study of meteorology that it has in all the other sciences. Our theories of climate have grown in order to keep pace with our increased means of observation, and from being local have become cosmical. The limitation of our unaided senses makes this the natural course in every science. To the first observers of the stars it seemed indisputable that this earth was the centre about which they all revolved, and an entire system of celestial mechanics was constructed to account for their circulation.

In meteorology an analogous growth has

taken place. Our showers were at first supposed to result from entirely local causes, and the theory formed for explaining them dealt only with such causes. The evaporation from any spot was supposed to be carried up into the colder regions of the atmosphere, and, being there condensed into cloud, was returned again as rain from where it rose as vapor. The use of the wet and dry bulb thermometers has shown, however, that evaporation is a sign of clear weather instead of rain; or, as Steinmetz, one of the best authorities, states in his "Sunshine and Showers," "Invariably, the greater the *evaporation* the less the *rain*, and *vice versa*, in every month and on all occasions"—page 144; and again, "An approaching thunder-storm is indicated by a rapid decrease of the daily *evaporation* during hot weather"—page 262.

It is now agreed by the best observers that our rain-falls are produced by the clouds in the upper strata of the atmosphere; and most probably the electric conditions upon which the fall of rain depends are to be found only there. The moisture which the atmosphere gathers by evaporation is condensed and deposited as rain only as it is subjected to the agency of electric forces. This we may accept as a demonstrated truth. That the moisture carried off from any spot by evaporation enters into the grand atmospheric circulation, is also a fact which any one can demonstrate to himself by observation. In every dry time in summer we see the earth growing day by day dryer as the hot sun evaporates the moisture from the ground, and yet the clouds may gather in the early evening only to disappear before the next day, when the same course is repeated. Every one who has ever noticed the weather must have seen times when it seemed as though it was trying hard to rain and could not. From this has come the common proverb, "All signs fail in a dry time."

Considerations of this kind, which have been arrived at only by observation, have forced meteorologists to abandon local causes for the explanation of rain; and Steinmetz, with others, fully recognizes that the showers of England originate in Continental Europe.

The true theory of our climate, of the yearly supply of moisture by rain, is probably, however, that put forth recently by Mr. Thomas B. Butler, of Hartford, Connecticut, in a work entitled, "A concise analytical and logical Development of the Atmospheric System." As this work was "printed for the author," an outline of its theory will not be amiss. Stated generally, his theory is that the *normal* condition of the weather is clear, and that the changes in it are produced by currents which originate in the tropics, and, following regular laws, circulate in the upper atmosphere about the earth, producing, or rather inducing, in spe-

cial localities, as they influence or are influenced by special local causes, the phenomena of the weather. The originating force of these currents he finds in the electric or magnetic forces induced by the sun.

That there is some connection between the spots on the sun and the activity of the terrestrial magnetic currents has been for some time the opinion of philosophers. In the Proceedings of the Manchester Literary and Philosophical Society, for March 8, 1864, is an article by Mr. Baxendell, F.R.A.S., upon "Periodic Changes in the Magnetic Condition of the Earth and in the Distribution of Temperature on its Surface," in which he says: "It has long been suspected that the same causes which produce the spots on the sun's disk must in some way have an important influence on the phenomena of our own atmosphere. The facts now given convert this suspicion into a certainty, and it is not, perhaps, too much to say that meteorology can never take rank as a true science while our knowledge of the sun remains in its present imperfect state." Other observers have come to the same conclusion.

Steinmetz quotes from Mr. Fullbrook, the well-known writer on rain-fall and meteorology, as follows: "From extensive observations he believes he has established the fact that whenever two planets form a right line with the earth, some disturbance connected with their light, electricity, or magnetic reaction takes place in the atmosphere, and a much larger quantity of rain—especially about the fourth or fifth day after—is the result; and the greater number of the more violent and extensive storms and hurricanes have occurred at or about the time of this *excess* of rain. This fact Mr. Fullbrook assures us," says Steinmetz, "he has verified by the investigation of three hundred consecutive conjunctions of planets in longitude, using the registers of Luke Howard for the vicinity of London, between the years 1807 and 1830 inclusive."

Unquestionably the forces in action upon this world are in connection with, and influenced by, those operating in the universe. The attraction of gravitation, which makes the rain fall, is the same force which, in a wider sphere, keeps the planets in their orbits; and a drop of dew assumes its spherical form by the action of the same force which rounded the earth and the sun himself. The circulation of the atmosphere, like that of the tides, is caused primarily by the action of cosmical forces, and the currents in the atmosphere, like those in the oceans, result from the action of universal causes. Mr. Butler in his work is, however, the first writer on meteorology within our knowledge who has claimed that this regular circulation in the atmosphere is the cause of the apparently fickle changes in the weather; that this circulation, as it is regular and constant, can

be observed, and the laws regulating its action discovered, and, as these are modified by local causes, the weather thus prognosticated.

Further than this, in his work he gives the results of his own observations upon this regular circulation of stormy conditions, and has illustrated them with most suggestive diagrams and maps. Of course it is impossible for any single observer, even though he uses, as Mr. Butler has, all the information which the casual observation of others may afford him, to get all the data necessary for formulating the laws regulating so vast a theatre of action as the atmospheric circulation of the world covers. Before this can be done thoroughly the world itself must be encircled with reliable observers, furnished with all the appliances necessary for making scientific and accurate observations. The organization of human society upon this planet is as yet very far from having reached this point of perfection. In fact, accurate and reliable meteorological observation is a matter of very recent origin. The instruments necessary for making such observations have not been in the possession of mankind longer than twenty or thirty years, and there is still need for further inventions. But the results which have been already attained with the fragmentary and incomplete materials at command promise fair for what we shall learn when, the telegraph encircling the world, placing scientific observers, stationed at all points, in instantaneous communication, the origin and progress of atmospheric changes may be traced with accuracy.

Toward this the world is tending; and one of the most important effects of this growth of our theories of the weather—of raising it from the plane of local to universal considerations—is that it affords another proof of the necessity and wisdom of union instead of discord among the inhabitants of the globe.

This necessity and wisdom are more apparent when we consider that the control of the weather is a domain for human industry. As yet the influence exerted by mankind upon the weather has been empirical and not scientific. But we know that the clearing of forests, the draining of land, the building of railroads, and a variety of other works, must and do affect the weather, since by these the normal conditions by which the weather is produced are altered.

Though this subject has engaged the attention of many writers upon meteorology and physical geography, and they are agreed that great changes in the climate are due to human agency, yet the want of accurate observation has made it impossible to arrive at more than general conclusions concerning the climatic effects that human industry has produced. While our theories of climate

were local, the effects of such human interference were, of course, supposed to be only local; but with the conception that the climate depends upon a universal circulation, which is affected by local causes, the interest in the production of such causes becomes also universal; and from this to the conception that it is only by a union and scientific application of the means at the command of mankind for affecting the climate that the universal interests can be furthered is but a step, though an important one, in the development of peace and good-will among men.

Thus far in the advance of our knowledge of the forces at work in nature we have always found them our friends, and that by their control we have improved our condition; nor is it questionable but that the control of the weather would be a continuation of the same experience. To attain this point is not as much an advance upon our present condition as our methods of agriculture, of transportation, of communicating intelligence by the telegraph, and a thousand other results of our complex civilization are upon the conditions of isolation and barbarism in which a large portion of the earth's inhabitants are still sunk, and from which the most advanced nations have raised themselves.

Precisely by what means these results are to be attained it is impossible to say. The necessities of civilization have developed the railroad and the telegraph. But though it was evident that the growing needs of mankind required some improved method of transportation and communication, it was impossible beforehand to exactly determine what that method would be.

THE WINTER WEDDING.

THE air is thick with falling snow,
The white drifts fill the street;
But, decked with flowers, the church, within,
As summer-time is sweet.
My earliest and my truest friend
To-day a bride will be!
Strew Love's own roses in her path,
For worthy Love is she.
And glad to twine her bridal wreath
Of orange flowers was I,
Though well I know the wedding kiss
Is Friendship's last "Good-by!"

Her girlhood's hopes and fears I knew,
Its pleasures and its cares;
But in a woman's highest bliss
No other woman shares.
And, grateful that this joy is hers,
I do not grieve to see
Her willing footsteps choose a path
That leads away from me.
For well I know the stars must fade
From out the sun-lit sky,
And evermore the wedding kiss
Is Friendship's last "Good-by!"

Editor's Easy Chair.

"I HAVE no doubt," said an old and sagacious citizen of Washington, as he rolled the Easy Chair along one of the spacious avenues, "that a hundred years hence thousands of people from all parts of the country will have their winter houses in this city, as they have their summer houses elsewhere." Certainly the great attractions of the city are not generally considered. Washington as a city has been always a joke. The common feeling is that it was an absurd site, selected in obedience to a foolish theory of the geographical centre of what would probably be the national domain, at least until time had slowly developed the illimitable West. Then it was laid out for a great city, and upon a remarkable plan; and such was the faith in the rapid growth of a city that the plateau upon the east front of the Capitol, upon which it was designed that the settlement should be made, became a point of speculation, so that the city grew up behind the Capitol; and the city of society and the public offices is now in the neighborhood and direction of the White House, while the Capitoline city has a certain sad and solitary character, like that of the royal heir in exile.

At an early day somebody called it a city of magnificent distances, and he told the truth, but not the whole truth. When that is said all is not said. The very distances, the noble breadth of the streets, make it a city full of sunshine and thoroughly ventilated. There is no more cheerful city in the world than Washington on a bright autumnal day. Yet it has nothing of what is called the metropolitan character. The chief street of business is Pennsylvania Avenue, the broad, straight, smoothly paved road between the Capitol and the Treasury. But there are no fine shops, and in the evening it is one of the least brilliant of city streets. The peculiar plan of the city, which at every few rods breaks the line of the main street with another crossing it at an extraordinary angle, not only utterly bewilders the passenger, and destroys the imposing uniformity of a continuous range of building, but gives the stranger a perplexing sense of advancing sideways, and he feels as if constantly bearing away from his direct line. The buildings, many of them, are low and mean and shabby, often with the air of a remote provincial town. But as you stand in the middle of the great avenue, and see the Capitol rising from the foliage and terraces at its base, its symmetry and magnificence seem almost too disproportionate.

The Capitol is the superb and conclusive argument against a removal of the seat of government. It is one of the most imposing buildings in the world. Indeed, there is none for great national purposes to be compared with it. Vast sums of money, however, have been squandered upon it. It is the monument of a thousand shameless jobs. It is a miracle of wasted space and inconvenience. Incongruity and tastelessness and absurdity abound in it. But as you drive over the heights, miles away from the city, that marvelous dome is still the most impressive and beautiful object that you see; and as you stand at night in front of the Capitol, when the moon is full, looking at the façade of either end, you feel the truth of the poet's lines,

"Earth proudly wears the Parthenon
As the best gem upon her zone."

The unblemished whiteness of the building is striking. It sparkles in the moon. Yet in the fullest sunshine it is never glaring to the distant eye. The neighborhood of Washington is so picturesquely rolling that the dome is constantly set in the finest landscape conditions. Its effect is like that of the grandest natural object—a mountain or the sea; and it gives a character to the entire landscape which would otherwise be wanting. The associations of the city are modern and political; but every great work of plastic art that touches the imagination belongs to the common realm of poetry. On some soft, rich October day, when the warmth of the sun is ripe, not crude, sweet as the juices of the fruits it mellows, drive to the cemetery on Georgetown Heights, a beautiful and sunny city of the dead. Then, pushing out upon the Rockville pike, you will see the Potomac Valley to the left and the shining line of the stream, and further round toward your right, as you turn, the Capitol. Turning at a certain point sharply to the left, and winding round along a narrow road, just upon the verge of the hill as you begin to descend, stop and look.

On such a day, in such a light and air, all things are beautiful. But here, on this rough road, among these untilled fields, this land of whose romance even Hawthorne despaired, you suddenly see at the same moment two of the most memorable views which your memory will bring back from Europe or from all historic and romantic lands. What magic spell intralls you—for you see at once the dome of St. Peter's from the Villa Doria, and the towered castle of Chillon upon the Lake of Geneva! It is the Capitol dome, with the long white line of the building itself, and the pile of the Georgetown College, which from this point seems to stand upon the edge of the Potomac, that broadens, apparently landlocked, into a placid and gleaming lake. It is a view which adds to the charm of the American landscape the fascination of romantic and historic suggestion. It is one of the pictures which memory never loses, which gives us, in a certain sense, all the beauty with none of the sadness of the scenes which it recalls.

THE interior of the Capitol, however, is almost as saddening as its exterior is imposing. It is painful to see the wasted space and the inconvenience. The lower story, or basement, is so dark that nothing is fairly seen except that it is an arched vault of beautiful marbles, the arches frescoed like the Golden House of Nero, or the exquisite passages of the Vatican, in whose decoration Raphael imitated the old imperial palace. The designs in this part of the Capitol seem to be American birds and flowers, with portraits interspersed—a rich profusion of form and color which is surprising and provoking, lost, as it is, in obscurity. Then groping up a marble staircase, with your hand resting upon a bronze railing elaborately and beautifully wrought, but hidden in the darkness, you enter the President's room, which is all marble and color, with long mirrors, and portraits in fresco of the members

of the first cabinet. It is but a step to the Senate-chamber, an unimpressive, obscure, and unventilated room, which has no contact whatever with the outer air.

The desks were removed, as we saw it, so that we could observe a system of ventilation which is partly controlled by every Senator. There is an opening like the register of a furnace under each seat, through which fresh air is forced up, and the Senator may either permit it to blow over his august person, which in a hot July evening may be agreeable, or he may close it. But there is a top, or cover, which must be turned up or down to open or close the aperture, and it is immovable. To the question what this was meant for, the reply was a benignant smile and the remark that it was designed to prevent Senatorial expectoration into the ventilating tube! For it appears that the fathers of the state are wont to give these conduits of fresh air a *quid pro quo*; and they had therefore been closed. But it was found that the chamber was too uncomfortable, and they have been again opened.

All the elaborate details of decoration in this chamber would be wisely exchanged for an immediate contact with the outer air. If the room had been so built that there might have been great windows through which the sunshine could stream in winter, and which in the early April and May days could be thrown wide open, the influence upon the health of the Senators and upon their debates could not but have been of the utmost advantage. Honorable gentlemen must then have been very eloquent to win the attention of their colleagues from the lovely grounds of the Capitol, or the soft distances beyond the Potomac. If beside the dim cloak-room, where at a single open fire-place Senatorial expectoration proceeds in the winter, there had been a balcony overhanging the shrubbery of the western front, upon which, in pleasant weather, the wise men might lounge, with all the world before them for expectorative purposes, the long session might have been endless, but it would have been delightful. But to the imposing exterior every thing has been sacrificed except the intrinsic magnificence of the marble rooms, especially the withdrawing-room, which is very fine.

The architect might plead that his task was almost hopeless. It was to include one most inconvenient building in another and a greater; and it is interesting to remark how from the dull chrysalis of the old Capitol the glittering result has emerged. The central building, or the nucleus, is of a composition which is painted white, and would therefore be a little mean in its impression if it were not absorbed in the real grandeur of the whole pile. Passing from the Senate-chamber across queer little "wells" for lighting the corridor, you may look in at the old chamber, in which now the majesty of the Supreme Court of the United States is enthroned. Its simplicity is impressive. A bench of judges whose collective aspect is not unworthy the sentiment of the tribunal, its central figure already historical in the political history of the last twenty years. And this small and modest chamber was "the decorated scene" of the careers of Webster, Clay, Calhoun, and of other men of conspicuous names, which, however, already begin to seem smaller than the last generation supposed them to be.

The Rotunda, or great central hall of the Capitol, is now happily freed from all scaffolding, and no longer looks like a second-rate old curiosity shop. It is a very impressive place, and worthy of the building. A curious observation presently discovers the remarkable pictures which surround it, among which the immortal shin-pieces are still the most conspicuous and the best. There is a quaint bareness and simplicity in the representation of the signing of the Declaration of Independence; but it is most interesting from the singular harmony of the whole with the conception of the scene which we get from history. The men of that time had a certain plain dignity and intelligence, which justified Chatham's famous eulogy of the Continental Congress. They have, in the picture, the aspect of respectable and resolute yeomen; and, could it have been painted at the time, and placed in Windsor or Kew, the British majesty itself, and the lord in the blue ribbon, might have seen in these faces the hopelessness of the struggle with the colonies.

The entrance to the Library of Congress is just out of the Rotunda, and as you pass in you stand in one of the best-arranged libraries in the world—only restricted by space. The rapid increase of the collection may be estimated when it is remembered that a copy of every new book issued in the United States is deposited here. Yet such is the excellence of the method of distribution that any book wanted is instantly found. The library is, of course, fire-proof, and the knowledge, experience, and sagacity of the librarian, Mr. Spofford, are felt in all the details of the management. The public service of such a man in such a place, with such associates as Dr. Gill, is incalculable. His realm is the mine from which will be painfully taken the substance of how many speeches yet to be! Upon these silent iron shelves what embryo eloquence reposes! Facts which will amaze senates, arguments which will persuade countries and change policies, illustrations which will thrill and charm the future, are all piled here, unconscious and unformed!

You step out upon the western balcony, looking toward the city. There, overhanging the beautiful terraces clustering with foliage, the librarian will perhaps remind you that Humboldt said that he knew no finer near prospect than that before you. Beyond the green descending foreground the great avenues of the city stretch away. There, to the southwest, are the heights of Arlington, and there the Fairfax Seminary. The Potomac, a line of silver, melts with the misty horizon, and you may see, possibly, the few spires and masts of Alexandria, and remember that, like "the Jerseys," it was good enough ground for Washington to tread, and that there he went to church. And as you once more gaze below upon the terraces, perhaps a tall, erect, stalwart man, with his thin hair lifted by the wind, and his hands sunk in the pockets of a thin blue overcoat, will pass beneath you, with a companion, descending the steps toward the city. It is the head of the third great branch of the government, the official descendant of John Jay—the Chief Justice of the United States.

But an Easy Chair rolling itself about the Capitol, and stopping every where to look with

interest, must see the old chamber of the people—the old hall of the House of Representatives—which it remembered but a few years since as an antechamber full of old apple-women and plaster casts. How incredibly small it is for a hall of so great historical renown! It is semicircular, and there are narrow little galleries, and shapeless, queer windows at the side, like those in a cellar. It is not light, nor dignified, nor tasteful, nor pleasing, and it leaves an odd impression of the ancestors who thought it a fine room. Yet these columns and walls have heard extraordinary eloquence, and have seen the beginnings of illustrious careers. There, for instance, high up on the wall, is a full-length portrait of the most famous orator of this hall—Henry Clay. There are one or two other portraits upon the walls, but they are mere waifs and estrays. There is apparently no design of a Congressional gallery.

Upon the floor are a few statues, arranged also without apparent design, except in two instances. There is a plaster copy of Houdin's Washington, which a painter in a white cap and overalls was gravely covering with white paint. It is a statue of peculiar interest, because the face is moulded from a mask taken from the living Washington. Opposite the Washington stands Miss Vinnie Ream's statue of Lincoln, which, whatever be the excellent qualities of the artist, is not a good statue. It lacks totally the ideal aspect of Mr. Lincoln—that which every body saw who saw him, and which every body recalls now that he is no more seen. This statue represents a limp, ill-favored man, and that is all. Near to it are the two statues which have been first contributed to the Congressional gallery of famous Americans. Each State is to give statues of two of its most famous sons, and Congress will keep them for our admonition and admiration in the old Representatives' Hall. Little Rhode Island is the first State to respond to the proposition by the statues of Roger Williams and General Greene.

There is no portrait of Roger Williams, and the sculptor, Mr. Simmons, has therefore made the figure of a benign, apostolic man, clad in the simple and picturesque costume of the Pilgrim age. The sweet and gentle graciousness of the aspect well becomes the apostle of "soul liberty," as he called it. So might Roger Williams have looked as he greeted the Indians at What Cheer Rock, upon the Seekonk, and so looking, have stepped ashore upon the bank of the Mooshausuc. In giving this work to the gallery, Rhode Island contributes the statue of the man who, of all the early settlers, had the deepest insight into the laws of human liberty—an insight which has been seldom rivaled to this day. The other Rhode Island statue is that of the Quaker soldier, General Greene, the friend of Washington. It is a fine, manly figure, in the Continental military costume.

These two figures stand alone, the first in the gallery. Rhode Island, indeed, could not be perplexed in her choice. Her founder and father is still the reverend object of her pride; and that he, first of all our great men, proclaimed, not religious toleration, but religious liberty, is a glory which will forever signalize the little State. No portrait of him, as we said, survives. In the State which associates his name with banks and

churches and halls, there is no other monument to him. But "what needs my Shakespeare for his honored bones?" If in the hearts of Rhode Islanders and in the spirit of their State the soul liberty of Roger Williams remains, he asks no other monument: and art, as in this statue, may fondly fashion the gentle and gracious figure which the imagination sees.

It is easy, if you linger long in the bare hall, which, despite its absurd want of every thing that makes a hall stately and imposing, is yet full of interesting associations, to perceive that when statues of their illustrious sons are contributed by the other States, it will be a striking historic gallery. It is certainly better to devote it to patriotic memories, to make it a Walhalla, than to abandon it to pea-nut peddlers and candy merchants. And passing out of it, leaving behind the memorable shades of the men of our first national epoch, we push on to the new Hall of Representatives, the illustrious arena of the second epoch of our history. This will always be memorable as the hall in which the people's House carried on the recent war. It is like the Senate-chamber, but larger and really more imposing. Its famous men are too recent, perhaps, to mention; and who shall say which of them Time, the devourer, will spare?

This is a perilously conspicuous stage. To this room the eyes and ears of the whole country are turned. You may loiter into the gallery during the session, when there is no exciting debate, and watch the members writing and reading newspapers, and chatting and clapping their hands for pages, and moving through the aisles, and pairing upon the sofas in earnest or listless conversation, reposing their honorable feet upon costly furniture, and expectorating at the expense of the nation—and yet the slight orator who is addressing the chair in a voice that you can scarcely hear as you lean from the gallery to listen, will be heard to-morrow morning from Katahdin to the Pacific. He must beware what he says, and before the eyes and ears of forty millions he is at the mercy of the clearer thought, the greater knowledge, the sharper wit of every man around him. Like Hamlet's shadowy father, he must be armed cap-a-pie.

And only he who is so armed can be a leader of this House. Knowledge, experience, imagination, rhetoric, passion, are useless without something more. Upon this field the warrior must not only have every weapon, but he must have every one at hand, so that in an instant he can whip it out, and drive it flashing to its point. He may rise to speak, full of his subject, warm with it, his copious tongue flowing with eloquent persuasion, or his clear intellect shaping the hardest facts to his purpose as a diamond cuts glass; but it is not enough, if he is not ready for every interruption, every question, every innuendo. He must catch every ball tossed at him, and hurl it triumphantly back. The swift reply, the sparkling repartee, the contemptuous sneer, the crafty suggestion—they will all bar his path, and he must throw all lightly down, and go smiling on his way. If he falters, he falls. If he can not answer every question, and baffle every objection, and turn back every argument, he fails. The weak link of the chain is found, and it is its strongest point.

He is the leader of such a popular assembly who takes the field against all comers, and holds it; and who is able, by sheer personal force, to control the mass. But what familiarity with rules, what quickness, what parliamentary fence, this requires? Ambitious gentlemen come up to the House, promising youth are sent here by admiring constituencies, bravoos and brawlers force themselves in; but the laws are absolute. The ambitious gentleman, fresh from his history of Pym and the Long Parliament, has somehow failed to read between the lines what Pym's secret was. The promising youth, who carried every thing before him in the college debating society, sits in a ludicrous stupor upon the edge of a charmed arena into which he dare not venture, or ventures only to show that he should not have tried. The bravo, who has bullied or bribed his way to this focus of public attention, finds himself reflected by the telegraph and the press to those forty millions of spectators very much as a rogue is reflected in the detective's photographic gallery. They all thought to be leaders, and they are all ignominiously led.

So there are wise men who serve silently. There are those who for half a dozen years are heard only when they answer as the roll is called. It is temperament and real modesty often, and a disinclination or an inability to speak. Those who are of another kind do not always remember that they are ever in their great task-master's—the country's—eye, and they pay the penalty. Repartees in such bodies often live in history longer than speeches. An apt quotation is often better than many arguments. There are unfortunate clever men who have advanced boldly to this scene, and when they stood in the very centre of regard all their talent and sagacity have suddenly disappeared under a witty repartee. Woe, woe to the hapless representative over whom close the waves of inextinguishable laughter. Single-speech Hamilton was not more surely and fatally named than he will be. He may have read of the thoroughly equipped soldier, master of strategy and of arms, who marches in pipe-clayed perfection to a victory scientifically sure. Alas! and here darts an Indian from ambush, and with one dextrous turn of his gleaming tomahawk has circled the head of the soldier, and vanishes with a whoop, dangling triumphantly his dripping token of victory. Alas! alas! but the representative slain upon this floor by a repartee is that perfectly pipe-clayed soldier.

If those who enter this charmed circle, which from the gallery we curiously regard, would only remember upon what a luminous height they stand, we should all be the gainers. For if they reflected that whenever they rise "their measure is taken" by the whole country, there might be a wholesome fear. Some of them, indeed, denounce the glass which holds them up to nature. Some are so exquisitely foolish as to defy the press. They might as well defy oxygen. It will still vivify the air we breathe, as the press will still reflect events, and comment upon men and current history. A representative defying the press is the African king breaking the thermometer to change the weather. Let him change his dress, not crush the thermometer. The man who in this hall defies the press is a man who in the heart of a huge reverberation shouts "Liar!

liar!" and from every point, with accumulating thunders, the returning peal crashes deafening upon his own brain, "Liar! liar!"

Let us go. But even the harmless droning that we hear as we rise will echo wide and far to-morrow morning, and be every where heard. Do you think with longing of the enchanted bugle that only those could wind who had music in their souls? or of the claymore of Wallace that only those could lift who were sons of giants? But, patience and patience! Carlyle sneers bitterly at the infinite tongue of the age, at the Jabesh Windbags, and the endless talk-bodies called Parliaments and Congresses. England is doomed, he thinks, because of talk, talk, talk. But better, surely, that the battles of progress and liberty should be fought with tongues in this great chamber than with shot and shell upon the awful field, and with heart-break in a thousand homes. Better the free tongue than the free lance.

WE pass from the stately building in which, however imposing it may be, the chief interest is not of art, but of politics, through the old hall again and the Rotunda, and stopping at the fine bronze doors, which are worthy the portal they guard and adorn, we step out upon the eastern front, where the President takes the oath at his inauguration. On one side is the group of the frontiersman and the Indian, and on the other Persico's absurd statue of Columbus. But in the common, or park, or pleasure-ground, in front of the Capitol upon this side, is the statue which invites us as we stand here. The absurd Persico Columbus, standing with a forward movement, and with one foot behind the other, is in the act of hurling a huge ball, like a bomb, at a figure sitting calmly yonder with its great marble hand raised as if to catch it. The comedy of this relation of the two statues is inevitable. They are the Greek ancestors of the ball-rolling comrades of Hendrick Hudson among the Catskill Mountains. Let us have our laugh, and pass on.

As we cross the spacious street to enter the grounds in which we see the sitting statue, an eager little girl and her older sister, or her young mother, pass us, and the little girl exclaims, as she looks up to the groups upon the Capitol steps, "Oh, come! Come over and see where those beautiful images are!" We, too, will see a beautiful image. It is in the centre of the grounds, and it is the long-ridiculed statue of Washington by Horatio Greenough—one of the noblest works ever produced in this country. As you stand before it you are conscious of the purest atmosphere of art. It makes that first, deep, satisfactory impression of all really fine works of art—an impression of earnestness and devotion. Possibly, indeed, the remembrance of the sculptor affects the feeling with which his work is seen by those who knew him. He was wholly absorbed in his art, and proud of it. He was a man of clear thought, of original imagination, of admirable accomplishment, and of a most flowing and eloquent tongue. He lived for many years, during the whole period of his activity, in Italy, like many of our chief sculptors—Powers, Crawford, Story—a practical alien.

Looking at his noble statue of Washington, it

must, perhaps, be frankly allowed that really fine and satisfactory to the imagination as it is, yet, for its purpose, and under the circumstances, it naturally strikes most Americans as a mistake. Here is a colossal statue of Washington, our Virginia planter of a hundred years ago, our revolutionary general, our first President, who is familiar to us in every detail, to the very shoe-buckles and sword-hilt of his time, and he is shown to us as a Roman in a toga, leaving his breast and shoulder bare, with sandals upon his feet, and sitting in a curule chair. That is evident. If it be a fault, let us confess it, and then acknowledge the grandeur and dignified repose of the figure—the serene majesty of the head and the expression. How solemn and tranquil and inspiring the presence of the statue is! Washington sits with the left hand stretched out upon the knee and holding an empty sword-sheath, in act of surrender or renunciation, and the other hand lifted points with the finger to heaven. "This won it; that shall keep it," is the legend which the lofty mien and simple action engrave upon your heart.

If you say that it is absurd to seat the gentleman, who lived only yonder beyond the masts of Alexandria, half naked in the open air, and exposed to the chances of the weather, the reply of the artist would be that it is not that gentleman; it is not the Continental general, in cocked hat and breeches; it is not the grave and stately President; but it is the tutelary genius of America expressed in his form. It is Washington as the imagination sees him—Washington not as general nor as President, but as man. It is the ideal Washington. And this idea of the sculptor perpetually asserts and vindicates itself in the statue. But to express it fully the work must be lifted in treatment out of the mesh of local and little associations. It must be treated as the old poets treated their heroes—as if they were gods. And to effect this, says the artist, certain conventionalities of treatment, which, because they are so, do not confuse the mind, must be adopted.

The difficulty here, however, is just what we see. The conventionalities are both local and characteristic. If the artist would represent man ideally, he must be nude. The toga is a Roman dress, with Roman associations, as much as the cocked hat and breeches are the Continental dress, with Continental associations; and inevitably, therefore, in looking at the statue, we do not see Washington as man or as tutelary genius, but Washington as a Roman. But the essential grandeur of the work transcends all such criti-

cism. The true criticism, from the point of view of art, probably is that an ideal sitting figure should be in perfect repose, with which the upward action of the lifted arm is inharmonious, and, therefore, a fault. Yet this, again, while we remark it as we walk around the statue, does not affect the greatness of its impression. The gracious benignity of the face is godlike, but it is Washington's. The face is as recognizable as that of Houdin's statue, and satisfies the imagination, which Houdin's does not. For *our* Washington is our fathers' Washington, and more. We do not and can not see him as they did; and it is this which the sculptor perceives.

The back of the curule chair is exquisitely wrought, and at each side of the back is a figure—one is Columbus meditating upon the New World, the other an Indian musing upon the end of his race. On the outer sides of the seat of the chair are two bass-reliefs: one is the young Hercules strangling the serpents, the other, young Apollo in his chariot driving in the day. You see how harmonious, how felicitous, how thoughtful, yet how broad and large every detail is. Upon three sides of the granite pedestal are Lee's words—"First in War, First in Peace, First in the Hearts of his Countrymen." But upon the back of the seat is the artist's inscription, also in the Roman tongue, as his work is technically Roman—"Simulacrum istud ad magnum Libertatis exemplum nec sine ipsa duraturum Horatius Greenough faciebat." As you read you feel that this is the work of no "self-taught" prodigy, no mechanic, no puffed and praised favorite, but of a thoughtful, educated, imaginative man, who heroically leaves to the judgment of posterity a work which must inevitably be at first ridiculed and misunderstood. Story's more famous works we know as yet only in the photographs; but we recall no statue in this country so grand and impressive as Greenough's Washington.

The sun is setting, and already the shadows gather about the Capitol. Facing its massive pile and the exquisite colonnades of its front sits the serene figure of our great hero, our father, our demi-god. His raised hand is a hand of benediction. Upon the temple of the people before him he invokes the Divine favor. And looking out from that temple upon his grave and noble form, the representatives of the people see the lofty mien of Heaven-trusting character and upright devotion which can alone preserve liberty, and with it national life. O conscript fathers! the heaven-pointing finger is one of warning. "*Nec sine ipsa duraturum.*"

Editor's Literary Record.

CHRISTMAS BOOKS.

FIRST on our list are five books of science and travel whose illustrations make them seasonable, and whose entertaining and instructive matter make them valuable as well.—*The Earth*, by ÉLISÉE RECLUS (Harper and Brothers) affords a new illustration of the increasing popularity of science and scientific literature. Even we can remember, and our hair is not yet gray nor are our eyes spectacled, when geography was of all stud-

ies the driest and most barren and uninteresting. Now we find, holding a high place among the Christmas books of the year, alike by the attractiveness of its dress, its ideas, and its style, a solid volume of nearly 600 pages on the history of the earth—i. e., on geography in its widest sense. It embraces four parts: first, "The Earth as a Planet," which treats of its place in the planetary system, and its probable, or rather hypothetical, origin; second, "The Land," which treats of the

distribution of continents, their forms and relations to each other, and the contour of the earth's surface, including mountains, valleys, and plains; third, "The Circulation of Water," embracing not only the action of springs and rivers, but also of snow and glaciers and subterranean streams; and fourth, "Subterranean Forces," in which volcanoes, earthquakes, and similar phenomena are described. The volume contains over two hundred and fifty maps, twenty-three of which are full, or double-page, and are very handsomely printed in colors. The map of the Alps is an admirable specimen of color-printing. From this brief outline the reader may get an idea of the comprehensiveness of the work. In matter it is fresh and modern; and while something of its French origin remains in the warm and glowing style, yet the author has never suffered his imagination to run away with his judgment, and never gives a brilliant hypothesis the place of a scientifically ascertained fact, as some of his scientific countrymen occasionally do—Pouchet, for example.

Science and art contribute similarly in presenting in *Corals and Coral Islands*, by Professor JAMES D. DANA (Dodd and Mead), a book equally attractive by reason of its author and its subject-matter to men of science, and by reason of its agreeable style and its handsome illustrations to the popular reader. It is an octavo of 500 pages, with over eighty wood-cuts, and three lithographic maps. Professor Dana's name is a sufficient assurance that we have the best and latest information on the subject, and those which are related to it, and he possesses, what few so scholarly men do, the power of conveying scientific information in a manner to bring it within the comprehension of unscientific readers.

Water and Land (Harper and Brothers) constitutes the third volume of Mr. JACOB ABBOTT'S series of "Science for the Young." It possesses the same features which characterize its predecessors—clearness and precision of statement, amplitude of illustration, and fullness and freshness of scientific fact and theory. The results of the latest investigations are incorporated in these volumes, whose title—"Science for the Young"—is not altogether adequate to describe their general character. They are, in fact, too far advanced for any but those youths whose minds have already reached some degree of maturity, and are quite as well calculated to meet the wants of men and women possessing scientific tastes, but lacking scientific education. In a word, they are well adapted to fill in science very much the place which is filled in history by the deservedly popular series of "Abbott's Illustrated Histories." The volume before us is fully illustrated with pictures which are useful as well as attractive.

In *Around the World* (Harper and Brothers) Dr. E. D. G. PRIME gives a narrative of his trip from New York round the world to New York again. In his preface he gives some useful directions to any reader who may be inclined to take a similar pleasure excursion. The difficulty of such a trip, and the dangers attendant upon it, are less than one might suppose who had not read the author's statement that in his case it was accomplished "without accident of any kind; without the occurrence of serious illness to any of the party; without missing a steamer

or a train; without detention for a single day—scarcely for an hour; and without the loss of the most trifling article of baggage." The narrative is a plain, simple, straightforward story of what the writer saw and what he experienced, with no attempt to create interest by imaginary adventure, or to enhance it by imaginative coloring. But it is full of information—as though written by one who had much to say, and no time or space to spend in ornament. It is elaborately illustrated.

We have very little faith in the literary endeavors of boys of sixteen. But there are some children who appear to be born, not with a silver spoon in their mouth, but with a gold pen in their hand; and the juvenile author of *A Boy's Journey round the World* (Harper and Brothers) appears to be one of these fortunate children. He started (so the preface of his father, Samuel Smiles, assures us) for Australia at the age of a little over sixteen. For about eighteen months he remained there, finally returning by the way of San Francisco and New York. He kept a full journal of his adventures, and wrote full letters home (for friends, not for the public), and out of these his father has arranged this book. If, as we are assured—and the style of the narrative sustains the statement—the editor has left the writer to tell the story in his own way and in his own words, the writer is warranted in keeping his pleasant pen in hand, for his way is an exceedingly pleasant way, and his words well chosen.

WE find on our table several books of poetry that are appropriate to the gift season, of which we put first, as most distinctively a Christmas book, an exceedingly elegant little volume, of a little over thirty pages, very tastefully illustrated, entitled *The Baby's Things*, by EDWARD ABBOTT (A. D. F. Randolph and Co.). It is just what its sub-title designates it—"A story for Christmas-eve." It is not, and does not pretend to be, a great poem, being both short and simple; but it is, what is in some respects better, a very tender and touching one, and admirable not merely in the lesson it inculcates, but yet more in the moral sentiments its reading invokes; for we should pity the mother who could read it with eyes unmoistened and with heart untouched. If Mr. Abbott succeeds in converting in any heart a paralyzing sorrow into an inspiring Christian trust by his poem, as was done in the case of the mother by her dream, he will have wrought a work as beneficent as it is wondrous.

Songs of the Heart (Charles Scribner and Co.) is well worthy of its predecessors, "Songs of Life" and "Songs of Home." It embraces in poetry a large selection of English and American poets, and in pictures represents a large proportion of our best American artists. Pictorially it is purely American, and, we think, better in its average than the similar collection of last year. There is a good deal of variety in both themes and treatment. The delicious bit of woods on page 29, by M'Entee, the polar days, by Moran, and the two contrasted sea pieces, by Parsons, may be taken to illustrate the range. And there are few or no pictures that are commonplace, and that have to depend on their companions to carry them.

A. D. F. Randolph presents anew to the public

FREDERICK SAUNDERS'S *Festival of Song*, in very handsome dress. In this "Series of Evenings with the Poets" Mr. Saunders, beginning with Chaucer and ending with Jean Ingelow, interweaves a little gossip about the writers with copious selections from their works. If he had attempted less, he would have done more. If he had selected a smaller number of poets, and given us, with some gossip of their lives and characters, and some general description of their literary characteristics, selections enough from their works to illustrate his criticisms, his work would have been both more entertaining and more instructive. As it is, his comments only suffice to give the book a fragmentary appearance, without adding much to our knowledge of the authors from whom he culls his selections. Yet it is a book of pleasant fragmentary reading; and if one were to read it through, he would, doubtless, get a very fair view of the general course of the history of English poetry.

Songs of the Spirit (A. D. F. Randolph and Co.) is a fitting companion to that admirable collection of two years ago from the same house, "Christ in Song." It is a collection of hymns to and concerning the Holy Spirit. The plan originated with Rev. W. H. Odenheimer, Bishop of New Jersey, but has been carried out and completed by Mr. F. M. Bird. The latter, in his introduction, speaks of it as "in some sort a contribution to the history of doctrine." It should rather be characterized as a contribution to the history of Christian experience, which is another and more important matter. It embraces hymns from the days of Ambrose to the present day, and includes selections from the English, Latin, Italian, German, Danish, and French. The author professes to include in his volume all hymns of any poetic merit—and some without much—that belong to his subject. We note, as a curious fact, that while Watts has contributed but three such hymns, Charles Wesley has contributed twenty-four, and that the doctrine or experience of the presence of the Holy Spirit has been growing in the Church—the ancient hymns being the fewest in number, while the present century contributes over two hundred and seventy. In some sense the book may be said to be a curiosity in literature; but it is really much more than that; and as an addition to the stores of spiritual poetry which the Church is accumulating, takes a place quite peculiarly its own.

A new and greatly enlarged edition of *The Poets of the Nineteenth Century* has been issued by Messrs. Harper and Brothers in season for the holidays. The additions comprise judiciously selected specimens from the works of American and English poets who have risen into prominence within the last twenty years, and a large number of fine engravings from original drawings by some of the foremost artists of the day. It is, as it now stands, we think, the most perfect of any of the collections of modern poetry before the public.

We have also new editions of the works of several of the poets, both English and American; *Burns's Poems*, with thirty-two full-page illustrations (Lee and Shepard), which are above the average degree of merit; *Goldsmith's Deserted Village* (J. E. Tilton and Co.), the illustrations in which are fair, but lack in clearness and freshness; *Yesterday, To-day, and*

Forever (Robert Carter and Brothers), a handsome red-line edition, with a portrait of the author; *Longfellow's Poems* and *Bret Harte's Poems* (James R. Osgood and Co.), with illustrations (Christmas, like misery, makes strange bed-fellows); and *Bryant's Poems* (D. Appleton and Co.), in a small, compact volume, in fine but clear type. We are also glad to see a new edition of *Thomas Hood's Works* (Porter and Coates), whose humor often rose to genuine sentiment, and rarely degenerated into vulgarity. It is far better to go back for pure fun than to take clownish attempts at it in bad grammar and bad spelling, because, forsooth, it is American! The only value of the illustrations in this edition of Hood consists in the fact that they appear to be exact reproductions of the art of a quarter of a century ago.—*Reynard the Fox* (Lee and Shepard) is a burlesque poem from the German. There is a good deal of humor in some of the pictures, but the fable, drawn out through 200 pages of rhyme, grows tedious.

Homely Scenes from Great Painters (Cassel, Petter, and Galpin) depends almost entirely upon its illustrations for its value. It contains twenty-four full-page photographs of home scenes by various English artists. It is not to be expected that the letterpress in such a work as this will be of much value, and it is not. There is a little pleasant gossip about each picture—enough to fill the interstices, and make the collection really a book. And those who need for every picture an interpreter will find Mr. TURNER a good enough cicerone through his own picture-gallery. But cicerones are generally bores, and such a gallery is to be judged not by the exhibitor, but by the exhibition, and that, in this case, is exceptionally fine. The principle on which the selection has been made, that of taking only homely subjects, is a good one, and the subjects themselves are well selected. Some of them are exceedingly beautiful; and none of them are poor or even commonplace. The twenty-four pictures represent twenty different painters.

Outline Illustrations to Shakspeare, by MORRIS RETZSCH (Roberts Brothers), is a volume, in form and character, something like Darley's "Margaret," of years gone by. We miss something of the simplicity of the American artist. The German symbolism is carried too far, and some of the scenes—those in "Macbeth" particularly—are somewhat exaggerated, and even in exceptional cases conventional. But there is something wonderful in the genius by which, in most of these pictures, a few lines have been made to tell a difficult story. Hamlet, in the grave-yard scene, for example, is a study which any lover of Shakspeare will enjoy turning to again and again. Indeed, it is characteristic of these pictures that they require and repay study, do not tell their tale to a superficial observer, and are not exhausted in one examination.

We have two books of illustrations from the pencil of the lamented PAUL KONEWKA—*The Catastrophe of the Hall* (Porter and Coates), which is a children's rhyme, telling the story of the quarrel and reconciliation of two cats, in which the artist has done wonderfully well, considering his very meagre subject; and *Falstaff and his Companions* (Roberts Brothers), which we like much better than his "Faust" of last year,

and almost as well as his "Midsummer Night's Dream" of the year before. "Falstaff" is capitally conceived.—*Good-Night and Good-Morning* (Roberts Brothers) is a pretty little poem of six verses exquisitely printed in color, with an illustration and an illuminated page to each verse—an exceedingly handsome piece of work (English, we judge) in engraving and printing, as well as in composition.

Lee and Shepard issue illustrated editions of *Pilgrim's Progress*, *Robinson Crusoe*, and *Gulliver's Travels*. Those of the first volume are of uneven merit. There are some scenes which the artist had better have left to the reader's imagination—the entrance into the Celestial City, for example. But there is a good deal of power in others; and we may well commend the edition as a decided improvement on the ordinary illustrated editions of this book, which has usually been marred rather than beautified by the artists. The illustrations to "Robinson Crusoe" and "Gulliver's Travels" are in the modern style of rough but vigorous drawing, which we do not greatly admire; but they are, particularly those in the latter volume, very good of their kind.—Of the literary merits of P. G. HAMERTON'S *Unknown River* (Roberts Brothers) we have no space to speak. Of the illustrations, which are etchings from nature, we can give no better idea, perhaps, at least to any one who has ever looked over an artist's port-folio, than to say that they resemble very nearly an artist's studies from nature, albeit somewhat more finished than such studies usually are. Of course they are imperfect; but they are spirited and vigorous, and except in one or two cases, where the drawing is inaccurate, are all the more interesting from their unfinished appearance.

Of course Santa Claus has not forgotten the children; does them, indeed, in the substantial character, if not in the appearance, of their literature, more than ordinary justice. *Dogs and their Doings* (Harper and Brothers) is a record of marvelous stories, credible and incredible, of the sagacity of the dog race. If one were to believe all that the Rev. F. O. MORRIS, B.A., has gathered up and here preserved, he would find no difficulty in Darwin's theory, unless, indeed, he were perplexed to conceive how the ordinary human mind should have fallen so far below canine intelligence. However, these anecdotes are none the less interesting because some of them are apocryphal; and we need not vouch for the historical accuracy of them all to vouch for their interest. The book is beautifully printed on tinted paper, and the engravings are, some of them, superb, and not one of them poor. It is emphatically a book for boys; only, if you do not want your boy to have a dog already, and you want to teach him kindness and sympathy for it, there is no better instructor.—*The Country of the Dwarfs* (Harper and Brothers) is a new book by PAUL DU CHAILLU. It tells, in his inimitable way, the story of his adventures in Africa with savage beasts and quite as savage men. It is more entrancing than most fictions; quite as strange, and a good deal more useful than most of them are. We confess to a warm liking for Paul, and hope he may live long to interest his great host of readers, young and old,

by the stories of his adventures. He has recently returned from a trip to Sweden, Norway, and Lapland, and will soon tell us of his new adventures.—We thought last year when we read "Puss-Cat Mew" that its author, whose very name — KNATCHBULL-HUGESSEN — appears as though it had been bewitched, was the best modern fairy-story teller we had ever met with. *Moonshine* (Macmillan and Co.), which is his contribution this year to the children's entertainment, does nothing to abate our respect for the author. Every writer has his best work, and "Moonshine" appears to us not quite so fresh and sparkling as its predecessor. But one need not read farther than the dedication in order to assure himself that this author has a lively imagination, and of just the kind to take hold of children's fancies.

Macmillan and Co. also publish three very pretty books for children, with illustrations by L. FRÖLICH.—*Puss and Robin* is a sort of nursery rhyme for very little folks, though it is by no means the nonsense that it is generally supposed nursery rhymes must be.—*The Lost Child*, by HENRY KINGSLEY, is a touching little story of a wanderer and his death. It has the charm of a weird poetic imagination about it, such as rarely invests stories for children.—*Little Lucy's Wonderful Globe* is a very ingeniously constructed story. It is the longest of the three, and is adapted to an older class among the little readers. Lucy, in a series of dreams about the globe she has been examining, is introduced to every country in succession, and wonders beyond measure at some of the strange things she learns in her dream-lessons. Though M. Frölich's drawing is not always correct, there is great genius in his pencil, which tells a wonderful story in a few graphic lines. In this respect he has certainly caught the true secret of art for the little folks; which, whether in picture or pencil sketches, consists in saying a great deal in simple and easily comprehended forms.—A somewhat similar book in design is *Distant Cousins* (Roberts Brothers), which puts geography in an equally attractive form. The twelve sketchy illustrations are admirable.

Three little books that ought to incite the very little folks to read for themselves are furnished in *The Rosedale Books*, by Mrs. D. P. SANFORD (E. P. Dutton and Co.). Mrs. Sanford has done very wisely not to confine herself to words of one syllable, a limitation which always results in unnatural sentences, and generally in doubtful grammar. Without doing this, she has succeeded very well in confining herself to simple and generally short words, so that her stories fairly justify their sub-title, "Easy reading for the dear little ones."—*Sing-Song* (Roberts Brothers), which CHRISTINA ROSSETTI by her pen, and the brothers DALZIEL by their pencil, have contributed to make rich in song and picture, is a great improvement on the old-fashioned nursery rhymes. A poem is the better, even for the smallest children, for having a moral meaning or a genuine feeling in it, as most, if not all, these little rhymes do.—*The Children's Album* and the *Children's Sunday Album* (Lee and Shepard), reproduced from the English, will also prove very attractive to the little folks, though the illustrations, which are numerous, would hardly bear the test of severe artistic criticism.

FICTION.

Richard Vandermarck, by the author of "Rutledge" (Charles Scribner and Co.), is a pure love story. There are but three characters in it—Pauline, Richard, and Mr. Langenau. There are some other personages in the story, but they are hardly characters, and neither add to nor detract from it. They are simply essential to its machinery, a sort of subordinate stock company to sustain the stars. The whole interest of the story—which is autobiographical in form—centres in the experiences of the narrator—Pauline d'Estree. Her passions impel her to one lover, her judgment inclines her to the other. The one proves at last to be a married man, and in his despair and wretchedness commits suicide, so saving the infatuated Pauline from a worse fate. The other bides his time, and in after-years wins the girl, whom the reader can not help feeling to be but poorly worthy of him. There is very little action in the story, save the rescue of Mr. Langenau by Richard, and his subsequent suicide; nothing to be called incident. Yet the writer's power in depicting the stormy experiences of poor Pauline is such that the story never grows dull, and one reads it almost at a sitting, not to trace the fortunes of the characters or to learn the issue of the plot—for, as we have said, there is but little plot, and the characters are few—but to see what is the outcome in Pauline's own character and life; whether the storm wrecks her or she weathers it. The book ends unsatisfactorily—indeed, can hardly be said to end at all—breaking off abruptly in the middle of a conversation, almost in the middle of a sentence, as though the author had become alarmed at the intenseness of his own narrative, and dared not try to tell what fruit this episode of passion brought forth in the future life, lest the calm should seem insipid after such a storm. It is, in a word, a novel of far more than average power, but of power not altogether healthy. Young girls are quite apt enough to think it a romantic thing to fall desperately in love with such characters as Mr. Langenau is represented to be, and do not need any incentive in that direction.

We do not wonder that the author of *Joshua Marvel* (Harper and Brothers) has been compared to Dickens, though the comparison might do him an unintentional injustice. Dickens gave birth to a score of literary imitators, who caught the superficial characteristics of his style, without imbibing his spirit or even imitating his painstaking assiduity. Like Dickens, Mr. FARJEON takes his heroes from the common people, and his scenes from common life. Like Dickens, he is in sympathy with the poor. Like Dickens, he has a wonderful power of minute observation. And, yet once more like Dickens, he has the artist's power to transfuse what he sees with a poetic glow which redeems it from the prosaic realism of a mere literary photographer. These are all admirably illustrated in the picture of Golden Cloud's funeral; and the humor of the birds in their mourning, and the pathos of poor Dan in his grief, are woven together with a genius which is quite foreign to the average modern novel. But about midway in the book the character of the story changes. Joshua Marvel is carried off to sea, and in the course of wild and improbable adventure which

follows, wherein love and revenge are inextricably intermixed, the tale loses something of its peculiar charm, and becomes more like a "novel of the period." Yet even here the author's genius is only obscured, not laid aside. And if Solomon Fewster is an improbable rascal, and the Lascar an all but impossible villain, neither of them is commonplace, and neither of them is made to violate the laws of his own improbable nature in order to carry out the plot to its consummation.

Hannah (Harper and Brothers) possesses one element of interest peculiarly English. It is written against the absurd law, happily unknown in American jurisprudence, which forbids a man from marrying his deceased wife's sister. We believe it is the second novel in which Miss MULLOCK—for by that name the literary world still knows her best—has ever undertaken to conduct a campaign against any legalized injustice. Still, her story is not controversial, but emphatically domestic. It ends in the prohibited marriage despite the law, Hannah and her husband taking refuge from English injustice on French soil. The interest in the book centres, after all, not in its polemical purpose, but in its characterization and its moral power. Even Miss Mullock herself has never drawn a finer character than Hannah, or more powerfully portrayed the bitter trials and noble triumphs of a true woman's life.

CHILDREN'S STORIES.

Muskingum Legends (J. B. Lippincott and Co.) reads very much like a "made up" book. The stories and papers, isolated, might do very good service as light reading in a weekly or monthly periodical, but they contain nothing to distinguish them from hundreds of similar productions which every week showers upon us, or to merit their permanent preservation in book form.—*Summer in the Forest* (American Tract Society) is a pleasant narrative of experiences in the Adirondacks, and how a Sabbath-school in the wilderness came of Christian labor in vacation-time.—*Four, and What they Did* (Hurd and Houghton), occupies half a volume of stories for young folks, and gives its title to the book. They are stories of Western life, and are capitally well told.—*Little Jakey* (Hurd and Houghton) is a touching story of a little blind German boy, told by himself to a blind companion, and reported in his broken tongue. There is genuine pathos in it, although the reader grows weary of the broken English which characterizes the whole narrative.—*August and Elvie* (Dodd and Mead) is one volume of a new series by JACOB ABBOTT. The many readers who have been delighted with the story of Jonas's management of Rollo, and Beechnut's management of Poinny, and Juno's management of Georgie will read with equal interest and benefit how August managed Elvie. Critics say that such characters are unnatural. They are certainly uncommon—more's the pity. But Mr. Abbott's aim is to show not how children are governed, but how they should be.—*The Old Back-Room* (Dodd and Mead) is a story of boy life and a mother's labors. With nothing remarkable in either plot or character, it is a natural, healthful, and entertaining story, which no boy can well read without being better for it.—*Tiptoe* (American Tract

Society) is decidedly superior to the average Sunday-school stories. It is more religious and more natural. Such a combination ought not to be rare in literature, but it is—so rare that our children are very much in danger of growing up to believe that piety and artificialness are almost synonymous terms. The anonymous author (for Katherine Williams is a *nom de plume*) inherits the ability to instruct and interest children; and we hope that "Tiptoe," which is her first story, may not be her last.—*The Seymours* (National Temperance Society) is a somewhat overwrought temperance story. Whether tales of experiences so sorrowful really have the moral effect which appears to be popularly attributed to them as a warning to those in danger, we think is somewhat doubtful. If they do, the daily newspapers ought to prove more efficacious instruments in the temperance cause than they now appear to be.—*Bending Willow* (Robert Carter and Brothers) is a tale of missionary life among the Indians of the Northwest. The theme is more romantic than the story, which is somewhat prosaic and literal.—*What the World made Them* (G. P. Putnam and Son) is a story of American life, with a glimpse of what purports to be college experiences, in which the anonymous author has drawn on a wild imagination for a picture of "hazing."—In *Stories from Old English Poetry* (Hurd and Houghton) Mrs. ABBY SAGE RICHARDSON has undertaken to introduce the children into the romances of the early literature by translating into modern prose stories chiefly from the verse of Chaucer, Spenser, and Shakspeare.—To the admirers of Mrs. E. PRENTISS we can not better describe *Aunt Jane's Hero* (A. D. F. Randolph) than by saying it is characteristic of her pen. It is a story of heroism in bearing the common ills of a common life—a heroism begotten by suffering in a soul by nature not heroic.

HISTORY AND BIOGRAPHY.

It was a fortunate and fitting choice which selected HENRY T. TUCKERMAN to write the *Life of John P. Kennedy* (G. P. Putnam and Son). Mr. Kennedy belonged at once to politics and literature, and achieved in each a success so considerable as to justify the belief that, if he had devoted himself exclusively to either, he might have occupied a foremost position in American history. In politics he belonged to the era which produced a Clay and a Webster, and if he did not equal them in power, he was not surpassed by either in high-toned honor and literary culture. In literature he belonged to the age that begot a Hawthorne and an Irving, and though he did not possess the idiosyncratic genius of the one, he hardly fell behind the other in the purity and simplicity of his style. His life is, therefore, a perpetual protest against demagogism in politics and sensationalism in literature; and for the interpretation of such a life it would be difficult to find a writer more admirably fitted than Henry T. Tuckerman. It is not often that we come across a memoir that has much value except as a memorial to friends. The "Life of Kennedy" is one of those exceptional biographies which we wish every aspirant for American honors, whether political or literary, might read.

From JOHN A. FROUDE we have a second series of *Short Studies on Historical Subjects*

(Charles Scribner and Co.). They include his famous address on "Calvinism;" one on the "Condition and Prospects of Protestantism," that affords a curious illustration of his incapacity to understand the religious faith which he travesties; two on "A Fortnight in Kerry," which no less illustrate the strength of his prejudices, while there is hardly one in the volume which is not, at least, entertaining reading.

Agnes Paschal is the memoir of a Revolutionary pensioner. As a memoir, there is nothing in the subject to give it special interest or value; but as a glimpse of pioneer life in Georgia from 1776 to 1869, it is at once instructive and entertaining.

MISCELLANEOUS.

FOR considerably over half a century Mr. JACOB ABBOTT has devoted a busy life to the education of the young—part of the time as a teacher, more of the time by his pen. The final result of these years of experience, hitherto given in fragmentary forms in fiction, he has embodied in *Gentle Measures in the Management and Training of the Young* (Harper and Brothers). The title characterizes the volume without the explanation which follows it, which is, nevertheless, worth quoting as a brief statement of the work which the author has endeavored to perform, viz., the exposition and enunciation of "the principles on which a firm parental authority may be established and maintained without violence or anger, and the right development of the moral and mental capacities be promoted by methods in harmony with the structure and characteristics of the juvenile mind." We regard it as one of the very best, if not the very best work of his hands. It has all the freshness and unction of the "Young Christian" and "Corner Stone," combined with the serene practical wisdom of large experience and mature years. It is animated by the spirit of Christian love, and founded on a deep knowledge of juvenile human nature. To young heads of families its sagacious counsels can not but prove invaluable; and if judiciously carried into effect can not fail to exert the most salutary influence on society. It deserves to constitute a standard work on education, and adds much to the already large debt which the community owes to the author.

We are heartily glad to see such tasteful and convenient editions of *Jeremy Taylor* and *Thomas à Kempis* (Lee and Shepard). These little volumes, pocket size, are capital in form, and they reproduce for the present age what is perhaps not perfectly adapted to its spiritual wants—for the age is less meditative than that which produced these books—but so well adapted to all ages that nothing more modern has succeeded in superseding them.—Messrs. Appleton send us the first three volumes of a new edition of *Charles Dickens's Works*. We are heartily glad to receive it, because a cheap, handy, and tasteful edition of the works of the great novelist was a desideratum. Each story is comprised in one small duodecimo of three or four hundred pages. Of course the print is fine, but it is clear. For readers of good eye-sight and small incomes it is an admirable edition.—Another old friend also comes to us in a new dress in Hurd and Houghton's new edition of *Sam Slick*, with illustrations by Darley.

Editor's Scientific Record.

SUMMARY OF SCIENTIFIC PROGRESS.

OUR last summary extended to the beginning of September; and we take up the thread again, renewing our oft-repeated reminder that we do not attempt more than a brief notice of such discoveries and announcements as are of popular, rather than of strictly scientific, interest.

Announcements of discoveries in theoretical and applied science in the proceedings of the various scientific associations held during the past summer are very numerous, although consisting largely of what has been already dwelt upon to a greater or less extent. Various notices, however, derived from the communications before the British and American associations, will be found in our pages.

In *Astronomy* the principal interest has centred in the preparations for the observations of the solar eclipse of December, 1871, although this has not been shared by the United States, which furnishes no representative, as it did to the observations of the eclipse of 1870. The English authorities have taken the necessary steps to send out parties from England, inviting several astronomers from America to accompany the expedition, who, however, were unable to respond. Mr. Jansen goes on the part of the French government, and the scientific bodies of Australia and New Zealand are expected to participate. Two new asteroids have been announced since our last report, constituting the 116th and 117th of the series. One of these was discovered by Professor Peters, of Hamilton College, who has attained great distinction in the line of planetary discoveries. Papers have appeared on the relation between terrestrial radiation and the zodiacal light; the determination of the period of the sun's rotation, by magnetic observations; and upon the parallax of α Lyrae, etc. The reappearance of Encke's and Tuttle's comets has just been announced, and spectroscopic observations of their light are in progress at the Washington Observatory.

In *Terrestrial Physics* we have reports of experiments in India with the pendulum for the determination of the mass of mountains, from which it would appear that the density of the earth at the surface decreases as we proceed from the sea-shore to the higher elevations of the mountain ranges; the observations showing this having been made under the direction of Captain Basevi, of the Indian service, who has, unfortunately, quite recently succumbed to his zeal for scientific research, dying of fever in the Himalayan Mountains.

In *Meteorology* we have numerous publications of statistics of observations at various stations, thus increasing largely the amount of material for further scientific investigation. A paper by Streintz shows, as the result of careful discussion of reliable observations, that the moon does not exercise any appreciable influence upon the weather, contrary to the opinion of some quite eminent writers.

The Signal Service of the United States has made an additional movement for utilizing its mission by inaugurating a system of signals throughout the country, along the sea-board and the lakes, for the purpose of giving warning of

the approach of storms where the wind is expected to exceed the velocity of thirty miles per hour.

In *Chemistry* we find great activity—perhaps more than in any other department of research—and various new substances continue to be brought to light. Among these we may mention *regianine*, found in the walnut; *acridine*, a new anthracene derivative; *carnine*, found in flesh, etc. Solet announces the discovery of two distinct spectra in the flame of sulphur.

In *Geology* we have an able paper by Professor T. Sterry Hunt, delivered before the late meeting of the American Scientific Association, upon the geognosy of the Appalachians and the origin of crystalline rocks; articles by Professor Dana upon the great glacier of the Connecticut Valley and of New England, etc.

The various geological surveys, of which mention has already been made, have continued their operations in the field, and several have closed their labors for the season, bringing back a large amount of material for investigation during the coming winter.

The science of *Geography* has been essentially advanced since the date of our last report, various memoirs having made their appearance, and reports of expeditions in the field presented to the public. Among these may be mentioned the safe arrival at Upernavik of the *Polaris*, under Captain Hall, and the prospect of valuable scientific results from the expedition. The expedition of Rosenthal into the arctic seas; the preparations of the Russian Geographical Society for expeditions next year; the fitting out of an expedition aiming at the pole by way of Behring Straits, under Lambert; the voyage of the *Pomerania* in the Baltic; the renewed examination into the currents of the Mediterranean by Dr. Carpenter, on the *Shearwater*; the voyage of Brenner in the Indian Ocean; the exploration of Madagascar by Grandidier, and that of Nachtigal in Africa; the report on South America by Dr. Habel, etc., are among the enterprises to be mentioned. By far the most interesting geographical research, however, has been that of Payer and Weyprecht on the *Ice Bear*, a sailing vessel, which left Tromsø only in May last, and, returning in October, reported having penetrated to 79° north and 43° east, into an open sea, through a belt of drift-ice. It is more than probable that several expeditions will repeat this route during the coming summer season, and that among the numerous parties, all striving for the common end, the secrets of the polar region will be largely brought to light.

As connected with this same subject of polar exploration, we may mention a valuable paper by Dr. Robert Brown upon the geography and physical character of the interior of Greenland.

In *Zoology* various memoirs of greater or less interest have made their appearance, increasing the known number of species of animals, or contributing information in regard to their geographical distribution or monographic relationships. Among those that may be mentioned more particularly is the discovery of a new lophioid fish (*Oneirodes*), by Lütken, and a memoir upon the genus *Certhiola*, by Finsch; a pa-

per upon the relation of the ganoid fishes to the plagiostomes, by Günther; essays on the classification of fishes, by Professor Cope, and on that of the mammals, by Professor Gill; a memoir upon the subterranean fauna of the Wyandot Cave, by Professor Cope; continuation of the great works upon the birds of Great Britain, by Gould, on the birds of Europe, by Sharpe and Dresser, on the *Phasianidæ*, by D. G. Elliot, etc.

Nothing specially interesting has been announced in the department of *Anthropology* beyond various communications made to the British and American associations, etc. Among the latter are the reports on explorations in Kent's Cavern and in Denbighshire, in England, of Cessnola's explorations on the island of Cyprus, etc.

In the way of researches in *Physiology* there has been much activity, although most of the papers are of more special interest to medical men. We have articles by Vohl and Eulenberg upon the action and character of tobacco-smoke, by Bert upon the effect of both increased and diminished pressure upon animals, by Professor Bernard upon the effect of heat upon animals, by Dr. Craig upon the effect of heat upon the human body, further explanations by Dr. Richardson of his theory of a nervous ether pervading the body, papers by Sorby upon autumnal foliage, and by Cailletet upon the absorption of moisture by leaves, etc. In domestic and household economy the artificial preparation of milk, according to a process published by Dubrunfaut and Gaudin, would seem to open up a new field of inquiry.

Under *Horticulture* we have a valuable paper by Mr. Riley, the State Entomologist of Missouri, upon the new grape leaf and root insect, *Phylloxera vastatrix*, showing its origin in the United States, and the history of its spread in Europe.

As usual, the departments of *Engineering*, *Mechanics*, and *Technology* have had many contributions at the meetings of the associations, the reports of which, as well as the current journals, embrace numerous important articles, which we can not pretend to reproduce. Among these, however, may be mentioned investigations into the disastrous explosion of gun-cotton at Stowmarket, England, shaking our faith in the idea that this agent is harmless unless exploded under certain conditions. The completion of the Mont Cenis Tunnel, and the regular passage of trains through it, unattended by any of the inconveniences that were anticipated, is a subject of special note; advantage having been taken of this by physicists, in various ways, for solving certain problems in terrestrial physics, such as the behavior of the pendulum at different depths, the internal temperature, etc. A paper by Bischof upon the Dinas Stone, a recently discovered and, as yet, comparatively unknown fire-proofing material, is likely to be of importance in the present epoch of great conflagrations.

The publication of a report on the mining statistics of the Western United States for 1870, as prepared by Mr. Raymond, furnishes important information in regard to this branch of applied science in America.

The appearance of the Report of the Department of Agriculture, and of the first part of the Report of the Commissioner of Patents, for 1870, will be a matter of interest to our readers.

Some of the other more important points to be referred to under this head are papers by Alloway upon the preparation of peat; the announcement of new and improved substances for water-proofing cloth; the substitutes for the use of the bichromate of potash in dyeing, in consequence of its recent great increase in price; papers by Dr. Percy on the manufacture of Russian iron; the preparation of phosphorus bronze; the new self-lighting, inextinguishable signal lamp devised by Holmes; the discovery of fuchsine and other new dyes, etc. Much advance has also been made in regard to the coating of metals in the wet way with tin, copper, nickel, etc.

Most important of all, perhaps, is the announcement of a new principle in the manufacture of glue, where the removal of the moisture is effected, not by evaporation, as heretofore, but by contact with certain salts, which rapidly absorb the water, and leave the glue ready for the final operation in the course of a few hours.

As usual toward the close of the summer, numerous papers relating to *Hygiene* have made their appearance, treating upon general sanitary questions and special conditions. Among other announcements, we are warned not to have implicit faith in carbolic acid as a disinfectant, but rather to depend upon such substances as the permanganate of potash, etc. Dr. Crace Calvert even informs us that heat is not to be relied upon for the destruction of the germs of disease, unless the temperature be brought up to between three and four hundred degrees, which, when employed for disinfecting cloth, frequently involves its scorching or entire destruction.

Under the head of *Miscellaneous Announcements* we have the sad news of the destruction of the Chicago Academy of Sciences, with all its precious natural history collections and library; the announcement of the intended celebration of the four hundredth birthday of Copernicus, on the 19th of February, 1873, at the village of Thorn; the visit of Mr. Gwyn Jeffreys, the eminent naturalist, to the United States; the announcement of further experiments upon the psychic force by Mr. Crookes, etc.

Our obituary notices embrace the names of Mr. J. De Carle Sowerby, a zoologist and botanist; Dr. Miller, a botanist; Dr. Schweigger-Seidel, a physiologist; Dr. Schloenbach, a geologist; Dr. Gerlach; Professor Hincks, of Toronto, and Mr. Robert Russell, of Scotland. The most important gaps in the ranks, however, are those caused by the deaths of Dr. J. E. Holbrook, of Charleston, an eminent zoologist, Mr. Charles Babbage, and Sir Roderick Murchison.

For fuller details in regard to the various points adverted to we must refer our readers, as usual, to the "Scientific Record" of the *Monthly* and the "Scientific Intelligence" of the *Weekly*.

BLUE DYE FROM MOLYBDENUM.

According to late experiments by Professor Böttger, based upon some previous researches of Dr. Schönn, if molybdic acid be dissolved to saturation in concentrated sulphuric acid with heat, an uncolored clear fluid is obtained, forming a double acid of sulphuric and molybdic acid. If a little of this double acid be placed in a porcelain dish and heated till it begins to throw off white vapors, and then a certain quantity of ab-

solute alcohol be gradually added, a beautiful blue color is developed, as if by magic, by means of which silk can be dyed without the use of any mordant.

FREEZING OF WATER.

In a recent communication to the Academy of Sciences of Paris M. Boussingault described some experiments showing that water is not liable to freeze, irrespective of the degree of cold to which it is submitted, as long as it is not allowed to expand in order to change into ice. In one instance water inclosed in a strong steel tube was exposed to a temperature of -13° Centigrade without congelation. This, however, occurred instantaneously on unscrewing the steel end of the tube. The fluidity of the water was made manifest by small steel spheres which moved freely inside of the tube during the whole process, and would have been stopped by congelation.

ACTION OF MAGNETISM ON GASES TRAVERSED BY ELECTRICAL CURRENTS.

In a paper by MM. A. de la Rive and E. Sarasin, in the *Bibliothèque Universelle*, the following conclusions are announced as the result of a long series of experiments upon the action of magnetism on gases traversed by electrical currents: 1. The action of magnetism exerted upon a portion only of an electric jet traversing a rarefied gas causes an augmentation of density in this portion. 2. This action exerted upon an electric jet placed *equatorially* between the poles of an electro-magnet produces in the rarefied gas an augmentation of resistance proportional to the conductivity of the gas itself. 3. On the contrary, it causes a corresponding *diminution* of resistance when the jet is axially between the two magnetic poles. 4. When the action of the magnetism is to impress a continuous movement of rotation upon the electric jet, it has no influence upon the conductivity if the rotation be in the plane perpendicular to the axis of the iron cylinder detaining the rotation, and diminishes it considerably if the rotation takes place so that the jet describes a cylinder round the axis. 5. These effects do not seem to be due to variations of density, but to perturbations in the arrangement of the particles of the rarefied gas.

INFLUENCE OF COLD ON THE STRENGTH OF IRON.

We have referred to the experiments of Mr. Brockbank in regard to the influence of cold upon the elasticity and strength of iron, and to the theory of M. Joule and others that cold, instead of weakening iron, actually adds to its strength. Mr. Peter Spence has lately presented to the Philosophical Society of Manchester a further communication on this subject, in which he expresses his adhesion to the opinions of M. Joule, and has no hesitation in stating it as a law that a specimen of cast iron having at 70° Fahrenheit a given power of resistance to transverse strain, will, when reduced to the temperature of zero, have that power increased by three per cent. After the reading of this paper Mr. James Garrick queried whether the results were legitimately deducible from the experiments mentioned by Mr. Spence, and thought that, for reasons adduced, the iron must have been of an inferior quality, and unfit for the purpose of relia-

ble experiments. The impression, however, at the present time is gaining ground that cold at least does not increase the tendency to fracture of iron, and that the greater amount of breakage is probably due, as previously suggested, to the diminished degree of elasticity of the road-bed, in consequence of the freezing of the soil.

DUCKHAM'S SELF-INDICATING WEIGHING-MACHINE.

The London *Mechanic's Magazine* for August 19 gives a figure of what it considers a very important mechanical improvement, namely, Duckham's Self-indicating Hydrostatic Weighing-Machine. This consists essentially of an open-top cylinder filled with water or oil, and fitted with a water-tight piston and pressure gauge; and when used for weighing goods is simply interposed between the crane on which they are suspended and the goods themselves. The indicator on the dial-plate turns as the object is lifted, and the weight is read off at once, the work being accomplished with the utmost celerity and accuracy. The machine is in use at the Royal Gun Factory, where masses of from thirty to fifty tons in weight can have their amount ascertained within a small fraction.

WATERING STREETS WITH SALINE SOLUTIONS.

The subject of watering the streets of cities with saline solutions, which, by their hygrometric properties, shall reduce the amount of evaporation, and consequently the frequency of application, is one that has excited much interest; and while the earlier experiments were rather unsatisfactory, later experiences have been more favorable. Quite recently the subject has been investigated in Hamburg, where 2500 pounds of water were combined with 125 pounds of chloride of calcium and 125 pounds of common salt; and this was distributed carefully in two applications over a surface of 1500 square yards, so as to make the entire surface moist. The first result was simply a positive inky smell, unaccompanied by the development of any saline crust, such as had been noticed previously. As a question of economy, it was found that the cost of this amount of saline material for one application was at least thirty times as great as one of pure water; or, in other words, thirty waterings with pure water could be made at the same expense. In reference to the use of ordinary sea water for streets, it is thought that this is advantageous only where it is cheaper than fresh-water, the development of an unpleasant smell being quite marked in most cases. The city of Newport, Rhode Island, is watered by contract with sea water, and it is said that the odor rising from the streets thus watered is sometimes almost insupportable.

TEMPERATURE REQUIRED TO KILL MICROSCOPIC ORGANISMS.

The discussion of experiments made in regard to spontaneous generation has proceeded upon the assumed basis that live germs are destroyed by exposure to a heat of 212° , or that of boiling water. Suspecting that this might not be true in all cases, Mr. Crace Calvert has lately instituted a series of investigations on the subject. Different substances were employed by him, par-

ticularly such as have generally formed the basis of experiments—namely, solutions of sugar, infusion of hay, solutions of gelatine, and water that has been in contact with putrid meat. Small tubes were selected of very thick and well-annealed glass, each tube about four centimeters long and five millimeters in diameter of bore. The substances to be operated upon were introduced into them, and left exposed to the atmosphere long enough for the germ life to be developed. Each tube was afterward hermetically sealed and wrapped in wire-gauze to prevent any accident to the operator in case of the bursting of the tube. They were then placed in oil baths, and gradually heated to the required temperature for half an hour. Without going into the details of experiment, we may mention, as the general result, that protoplasmic life was found to be only slightly affected by a temperature of 212° , and that even at 300° it is not entirely destroyed, except in the case of gelatine. In another case the temperature of 400° Fahr. was required to destroy life.

These experiments, therefore, show that the life found by previous experimenters in boiled liquid was not due to spontaneous generation, but to life which had remained in the fluids, as in none of the experiments on record, as made by the advocates of the spontaneous generation theory, was heat raised above a temperature of 300° .

Proceeding to the other extreme of temperature, Mr. Calvert subjected some putrid meat liquor, containing a large quantity of animalcules, for twenty hours to a temperature ranging between that of the freezing-point of water to 17° below it. When the ice was melted animalcules were found to have maintained their vitality, and in two hours they resumed their original activity. This corroborates the experiments of Professor Melsens, who ascertained that the most intense cold does not destroy the active power of vaccine lymph.

PROOF OF THE NEBULAR HYPOTHESIS BY THE SPECTROSCOPE.

In the September number of the *American Journal of Science*, Professor Daniel Kirkwood presents the testimony of the spectroscope in regard to the truth of the nebular hypothesis, beginning by calling attention to the supposed annihilation of this hypothesis by the observations of Lord Rosse and of Professor Bond, both of whom succeeded, in March, 1846, as they thought, in resolving certain supposed nebulae into stars. These observations were considered by the majority of astronomers as fatal to the claims of the nebular hypothesis. But, according to Professor Kirkwood, this has more than recovered from the shock it received, and the more recent application of the spectroscope to the investigation of the nebulae proves its truth conclusively. The general result of the later examinations he sums up in the following manner:

1. The ring nebula in Lyra, the dumb-bell nebula, the great nebula in Orion, and others which might be named, are not, as was but recently believed, extremely remote sidereal clusters, but their light undoubtedly emanates from matter in a gaseous form.

2. According to Lord Rosse and Professor Bond, the brighter parts near the trapezium (in

the nebula of Orion) consist of clustering stars. If this be the true appearance of the nebula under great telescopic power, then these discrete points of light must indicate separate and probably denser portions of the gas, and the whole nebula is to be regarded rather as a system of gaseous bodies than as an unbroken vaporous mass.

3. Progressive changes in the physical condition of certain nebulae are clearly indicated by the fact that nuclei have been established which, as shown by their spectra, are not wholly gaseous, but have passed, at least partially, to the solid or liquid form.

4. The spectroscopical analysis of the light of several comets reveals a constitution similar to that of the gaseous nebulae.

The spectroscope, then, has *demonstrated* the present existence of immense nebulous masses, such as that from which Laplace supposed the solar system to have been derived. It has shown, moreover, a progressive change in their physical structure, in accordance with the views of the same astronomer. In short, the evidence afforded by spectrum analysis in favor of the nebular hypothesis is cumulative, and of itself sufficient to give this celebrated theory a high degree of probability.

PARALLAX OF A STAR.

The bright star, α Lyræ, now conspicuous in the northwest every evening, must now be added to the few of which the parallax is known with considerable accuracy. Dr. Brünnow, formerly director of the observatory at Ann Arbor, and now astronomer royal for Ireland, has lately computed a series of careful and most accurate measurements on this star, made by comparison with a minute star near it, known as Struve's Companion. The result is that the parallax is almost exactly one-fifth of a second. An idea of the smallness of this angle may be formed by reflecting that the smallest visible object subtends an angle of about one minute; so that if the angle which Dr. Brünnow had to measure were increased three hundred times, it would still appear to the naked eye as a mere point. Yet this is the angle subtended by the distance from the earth to the sun as seen from the star. The corresponding distance of the star is a little more than a million times that of the sun, or about 93,000,000,000,000 miles. Previous determinations of this parallax, by Peters and the Struves, have ranged from one-tenth to one-fourth of a second; but the extreme difficulty of measuring so small an angle made them all a little doubtful.

NEW SPECIES OF SIEBOLDIA IN CHINA.

The interesting announcement has lately been made to the Academy of Sciences in Paris of the discovery in Western China of a new species of giant salamander (*Sieboldia davidiana*), closely resembling in general character the well-known species of Japan, but differing in several important points. These consist principally in the less confluent character of the tubercles on the surface of the head and anterior portion of the body, and their greater degree of regularity, forming regular lines, with well-marked figures. The eye is inclosed in a double range of tubercles, which, on the internal face, become angular like a very open V, while in the Japan species the tubercles present

only a confused arrangement. The Chinese animal, too, appears to have the fingers and toes a little longer in proportion, and the general color of the body darker. It lives on the frontier of the Celestial empire, in the clear and limpid waters which descend from the mountains of the Khou-kou-noor, where it reaches enormous dimensions, some specimens having been met with weighing from fifty to seventy pounds.

CARBOLIC ACID IN SNAKE POISONING.

Nature informs us that, according to recent French investigations, the application of carbolie acid, after the bite of the viper, is a remedy both for local and general poisoning. The acid is to be used in the proportion of two parts to one of alcohol, and must be applied at once, since if given internally, or applied to the wound at a late period, it has no effect. It is believed to act not by neutralizing the poison, but by contraction of the small vessels, thus preventing absorption.

TRANSPARENT GREEN VARNISH.

A beautifully transparent green varnish is made by taking a small quantity of "Chinese blue," with about twice the amount of finely powdered chromate of potash, and stirring these in copal varnish thinned with turpentine. A thorough grinding of this mixture must be made for the purpose of intimately incorporating the ingredients, as otherwise it will not be transparent. A preponderance of chromate of potash gives a yellowish shade to the green, and a deficiency increases the amount of blue. This varnish, thus colored, produces a very striking effect in japanned goods, paper-hangings, etc., and can be made very cheaply.

VARIATION OF COLOR IN BIRDS WITH THE LOCALITY.

The subject of variation of color in birds, as expressing specific distinctions, has for a long time occupied the attention of ornithologists; and while with some the slightest difference in shade was sufficient to establish a separate species, a wide variation is allowed by others without affecting the idea of specific identity. We are gradually, however, coming to appreciate the influence which external conditions, such as light or shade, moisture or dryness, varying temperature, latitude, etc., produce upon color; and so long as the general pattern remains the same we can allow a great variation in tint, and even in size, since, as is well known, this depends largely upon latitude or altitude of birth-place and residence. As a general rule, it may be said that as we go southward from a north temperate latitude, with the increasing temperature and brighter sky the colors are deeper and the size less; and, on the other hand, in proceeding northward and into more clouded atmospheres, the dimensions become greater, with a decrease in general brilliancy. In sandy or barren regions the accompanying birds become of a grayish tint, while in red soils a reddish shade will be appreciable.

Again, in certain regions the birds exhibit a tendency to melanism, or a blackening, this being noticeable in Florida, and more especially in the West India Islands, as compared with the United States. An instance of this is seen in the common red-winged blackbird, the female

of which, as found in the United States, is variegated with brown, yellowish, and grayish streaks, the male alone being a glossy black, with red shoulders. A blackbird is found in Cuba, however, the male of which is undistinguishable from our bird, excepting in the smaller size, while the female is of a uniform lustrous black, differing only from the male in the absence of red upon the shoulders. Similar comparative peculiarities are presented in quite a number of West Indian birds.

CELESTIAL ORIGIN OF POSITIVE ELECTRICITY.

M. Becquerel has recently presented a memoir to the Academy of Sciences of Paris upon the celestial origin of atmospheric electricity, or rather of the positive electricity distributed in enormous quantities in the planetary spaces. This he finds in the hydrogen electrized positively which escapes continually from the sun. According to modern observations the solar spots are in reality cavities, by which the hydrogen, and the various substances composing the solar atmosphere, escape from the photosphere, this hydrogen being the result of a decomposition, bringing with it positive electricity, which is distributed in the planetary spaces, diminishing in intensity more and more toward the earth, in consequence of the poor conducting power of the more and more dense strata of the air, and of the superficial crust of the earth, this latter being negative only because it is less positive than the air.

For this electricity to be propagated in any medium, some substance is necessary as a vehicle; and it is established, in fact, that the luminous properties of electricity belong in a great degree, if not entirely, to the ponderable matter across which the electric discharges are transmitted. The auroras result from the discharges of this electricity, thus explaining, according to M. Becquerel, the rustling or crackling sound heard by the inhabitants of the polar regions. This occurrence, although apparently well attested, has been denied by some; but the experience of M. Rollier, the intrepid aeronaut who was carried in his balloon last December from Paris to Norway, and landed upon a snow-covered mountain 10,000 feet high, confirms this view. This gentleman remarks, in his report of the voyage, that while passing through a thin fog he perceived the brilliant rays of an aurora tinging every thing with its strange light. Very soon a curious and incomprehensible roaring was heard; but this, after a time, ceased entirely, with the development of a decided odor of sulphur, which was almost suffocating.

GRAPHITE IN GRAY OXIDE OF IRON.

From recent investigations of Sneller we are informed that the graphite segregated in gray oxide of iron consists of pure carbon, but that there is no free graphite-like silicon associated with it, although some occurs in combination. The quantity of carbon which remains enveloped in the hardening of a fluid cast iron appears to be dependent on the proportion in which the carbon was dissolved in the liquid iron, and upon the rapidity with which the transformation took place from the liquid to the solid state, rather than upon the quantity of foreign ele-

ments, such as manganese, sulphur, phosphorus, silicon, etc., thus not upon the height of the temperature at which the iron was treated. While in puddling nearly all the silicon is burned before the carbon becomes oxidized, this process of oxidation in the Bessemer method comes on about equally with the two elements, if not even more rapidly with the silicon. The remarkable fact that the same amount of silica which makes the Bessemer and cast steel cold-short does not affect the quality of wrought iron under all conditions appears to depend upon the circumstance that steel contains the silica in a state of chemical combination, while in wrought iron it only occurs as a slag.

ON NOMENCLATURE OF UNITS OF FORCE AND ENERGY.

Professor Everett calls the attention of the British Association to the necessity of giving names to *absolute* units of force and of energy—that is, units not varying with locality, like the gravitation units vulgarly employed (pound, foot-pound, etc.), but defined by reference to specified units of mass, length, and time, according to the condition that unit force, acting on unit mass, produces unit acceleration. He proposed that the units of force and of energy (or of work), thus related to the gramme, meter, and second, be called respectively the *dyne* and the *pone*; and the names *kilodyne*, *megadyne*, *kilopone*, *megapone* be employed to denote a thousand and a million of these fundamental units. After the reading of the paper the subject was considered by the mathematical and physical section of the association, and a committee was appointed, conjointly with one from the section of mechanical science, for the purpose of framing a nomenclature of units of force and energy.

NEW COLORING MATTERS.

Professor Baeyer has lately brought to the notice of the Chemical Society of Berlin a new class of coloring matters. Thus, if pyrogalllic acid be melted with naphthalic acid and some other substances, a new coloring material is obtained, named by him *gallein*, which appears in the form of either a brownish-red powder, or of small metallic green crystals. If this be boiled with a good deal of water, with addition of zinc and dilute sulphuric acid, the dark color of the liquid is transformed, after a certain time, into a light reddish-yellow. Some resinous matter will be separated from this by filtering, and the liquid becomes clear; but, on cooling, is clouded again by the separation of some oil drops, which after a time become crystallized. Ultimately large brownish-red crystals are obtained, which consist of *gallin* mixed with a little gallein.

If gallin be heated with twenty parts of concentrated sulphuric acid to 200° C., the reddish-brown color of the solution changes after a time to a greenish-brown. After the reaction is completed, the mass is to be boiled in a large amount of water, and the very voluminous deposit washed with hot water. This consists of *cœrulein*—a substance readily soluble in hot aniline, with the production of a beautiful indigo-blue color. Other substances referred to in Professor Baeyer's paper are *cœrulin*, *refolein*, *fluorescein*—the latter of which will impart a

beautiful yellow color to silk and wool without any mordant.

Attention is called to the similarity of gallein, gallin, *cœrulein*, and *cœrulin* to the coloring matter of wood. The relationship is particularly striking between gallein and the coloring matter of logwood, and between *cœrulein* and the *lo-kao* of the Chinese.

SOLVENT OF INDIGO.

According to the *Journal of the Society of Arts*, Venice turpentine, or paraffine, heated to the boiling-point, will dissolve indigo with the same blue color as a solution of sulphuric acid; in petroleum indigo forms a carmine solution, while in spermaceti it produces a carmine-violet, and in stearic acid a blue color.

MALLEABLE BRONZE.

It is said that in consequence of the announcements made some months ago before the Academy of Sciences of Paris in reference to the subject of malleable bronze, this substance is now likely to come into practical use in European and American art. The existence of such a substance has long been known from specimens of very ancient origin, and from its use by the Chinese in the construction of their tom-toms. It may be prepared from bell-metal bronze, to which 20 per cent. of tin has been added, and heating to a dark red. This generally brittle metal thus becomes malleable, and can be readily forged and rolled out from a thickness of three or four millimeters to that of a half to a quarter of a millimeter. In the operation the density of the metal is increased, and it can be welded easily, preserving its entire homogeneity. The whole secret rests in giving the bronze the proper degree of heat, since, without this, it remains brittle.

ARSENIOUS ACID AND ALBUMEN.

The preservation of albumen for manufacturing purposes is a problem of much interest, in view of the great use of this substance in the arts, one method consisting in the addition of a slight amount of arsenious acid, or arsenite of soda. The use of the former is, however, sometimes inconvenient, on account of the great insolubility; and that of the latter is occasionally objectionable on account of its alkaline action affecting the application of the albumen. For the purpose of obviating these objections, Paraf suggested the boiling of the arsenious acid with glycerine, in which it is quite soluble; after allowing the solution to cool, and to stand for twenty-four hours, a few drops may be added to the albumen. The same substance can be added to gum-arabic, paste, and other substances, to prevent fermentation, putrefaction, and the development of fungi. It will, of course, be understood that arsenic in this preparation is highly poisonous, and its use with substances intended to be eaten is, therefore, out of the question.

LIEURNUR METHOD OF REMOVING NIGHT-SOIL.

The difficulty of solving the problem of the economical and speedy removal of night-soil is a subject that is continually pressing upon the attention of our cities with increasing weight, and numerous propositions looking toward this end have

been discussed or adopted. Among others, that of Mr. Lieurnur, of Haarlem, has been received quite favorably, and is being brought into practical application in various portions of Europe. This consists in the establishment of a series of iron pipes, which bring the soil into iron reservoirs, and which are so connected with an air-pump as to be capable of exhaustion. When this is done the connecting pipes are opened, and the pressure of the air forces more or less of the excrement with which they are laden into the reservoir. From this it is taken up by means of a pump into a specially arranged air-tight wagon, and carried off to be manufactured into a fertilizer.

OINTMENT FOR GUN-BARRELS ON THE SEA-SHORE.

It is said that an ointment made of corrosive sublimate and lard will prove an effectual protection against the rusting of gun-barrels on the sea-shore.

ELECTROPLATING METAL WITH NICKEL AND COBALT.

A process devised by Mr. Nagel, of Hamburg, for coating iron, steel, and other oxidizable metals with an electro deposit of nickel or cobalt consists in taking 400 parts, by weight, of pure sulphate of the protoxide of nickel by crystallization, and 200 parts, by weight, of pure ammonia, so as to form a double salt, which is then dissolved in 6000 parts of distilled water, and 1200 parts of ammoniacal solution, of the specific gravity of 0.909, added. The electro deposit is effected by an ordinary galvanic current, using a platinum positive pole, the solution being heated to about 100° Fahrenheit. The strength of the galvanic current is regulated according to the number of objects to be coated. For coating with cobalt, 138 parts, by weight, of pure sulphate of cobalt are combined with 69 parts of pure ammonia, to form a double salt, which is then dissolved in 1000 parts of distilled water, and 120 parts of ammoniacal solution, of the same specific gravity as before, are added. The process of deposition with cobalt is the same as with nickel.

NEW FOSSIL CRUSTACEANS.

According to Mr. Woodward, twenty-three new species of fossil crustaceans have been discovered and described within the last year, one of them, of a very extensive distribution, occurring in Upper Silesia, in Turin, and in three distinct localities of England. He gives in his adhesion to the views of Mr. Billings in regard to the possession of feet by trilobites, and thinks that this fact, if established, would carry the isopod class back in time to the earliest paleozoic rocks. He dissents from the views of Dr. Packard, who, from the examination of their embryos, proposes to bring the king-crab, or common horseshoe-crab of the United States, near to the trilobites.

WATER-PROOFING PREPARATION.

A method of rendering woven fabrics water-proof, without filling up the interstices of the cloth so as to prevent the passage of perspiration, is announced by Professor Balard. For this purpose acetate of alumina is prepared by dissolving an ounce of acetate of lead in a pint

of distilled water, and three-quarters of an ounce of sulphate of alumina in the same quantity of water. These solutions having been mixed and filtered, the cloth to be rendered water-proof is immersed in the mixture for a quarter of an hour, and is then drained and dried in a current of air.

COLORS OF FOSSIL SHELLS.

In an inquiry into the possibility of determining the original colors of fossil shells, by Kayser, it was found that reds were more durable than any other color, this tint being appreciable in forms where their nearest living allies were of somewhat similar shades.

PARKES ON EFFECT OF DIET AND EXERCISE ON ELIMINATION OF NITROGEN.

Dr. Parkes, while investigating the effect of diet and exercise on the elimination of nitrogen, had for his subject a very healthy, powerful, and temperate young soldier. He conducted one series of experiments in which the man was fed on ordinary diet, and the amount of nitrogen content was kept as near as possible constant. In a second series prepared food was given so as to keep the amount of nitrogen introduced perfectly constant; and a third series was made with non-nitrogenous food. These experiments showed distinctly an increased elimination of nitrogen in the period of rest after severe exercise, confirming Dr. Parkes's former results, and supporting the statement of Liebig on this point, in opposition to that of Voit. Whether it was diminished during exercise or not was not clearly shown by the experiments. The non-nitrogenous diet for five days neither raised nor lowered the temperature in the rectum of the patient, but apparently did not affect the health, nor did it alter the frequency of the pulse; but the heart's action became weak, and the pulse soft. The experiments proved that force necessary for great muscular work can be obtained by the muscle from fat and starch, though changes in the nitrogenous constituents of the muscles also go on, which have, as one effect, an increased elimination of nitrogen after the cessation of the work.

GILDING AND SILVERING SILK.

According to a formula published by Grüne, for silvering or gilding silk, the silk is to be soaked with a 5 per cent. solution of iodide of potassium, and dried; then (in non-actinic light) dipped in a 5 per cent. solution of nitrate of silver, containing a few drops of nitric acid, and well drained; next exposed for a few minutes to sunlight, and then dipped in a 2 per cent. solution of sulphate of iron. It immediately becomes gray, from reduction of metallic silver, and, after washing and drying, only requires burnishing in order to acquire the metallic lustre. By repeating this treatment, varied, however, by adding a little free iodine to the solution of iodide of potassium, the silver deposit becomes stronger. By laying the silvered silk in a very weak solution of chloride of gold, the silver becomes chloride, and gold is deposited; and by then removing the chloride of silver by a solution of hyposulphite of soda, washing, drying, and burnishing, the appearance of gilding is produced, if the deposit of metal be sufficiently thick. The purest chemicals must be used in order to secure satisfactory results.

INHALATION OF DUST BY WORKMEN.

The injurious effect of exposure to the dust of various manufacturing establishments has not unfrequently been dwelt upon with more or less force; but we are hardly prepared for the result of certain specific investigations on this subject. It has long been a disputed point whether the particles of iron, silica, etc., merely lodge within the air-cells of the lungs, or penetrate through their walls into the tissue between them. But Professor Zenker informs us that, on examining the lung of a woman who had been exposed to the dust of iron oxide, used in preparing books of gold-leaf, he found the powder in the tissue between the air-cells and in their walls, as well as in their cavities. From less than two ounces of this lung over twelve grains of iron oxide were obtained by chemical methods; so that, if equally distributed through both lungs, there must have been at least three-quarters of an ounce inhaled. In another case—that of a workman exposed to the dust of a mixture used in preparing ultramarine substances—he found a quantity estimated at fully an ounce.

ILLUSTRATION OF PSYCHIC FORCE.

A correspondent of *Les Mondes*, writing in reference to the communications which have appeared in regard to the "psychic force," narrates a curious fact as coming within his own experience. He states that a favorite dog had been in the habit of taking up his abode upon a skin of a white bear in his master's chamber. On one occasion, while the dog was reclining upon the skin, the writer looking at him and admiring the entire confidence with which he rested his head upon the skin of this polar monster, the thought suddenly came into his mind as to the effect that would be produced upon the dog if it were a real bear, and not a mere skin. In a flash the dog gave a sudden bound, and got as far off the skin as possible, his ears erect and hair standing on end, with his mouth open, and exhibiting the utmost anxiety and terror. It was a long time before the animal could be induced to approach the skin and recline upon it as before, several days elapsing before this could be brought about.

NICKEL AND COBALT PLATING IN THE WET WAY.

Professor Stolba, of the polytechnic laboratory of the Polytechnicon, of Prague, a chemist who has been the first to announce to the world several important technical discoveries, especially in reference to the plating of metals, has just published, in Dingler's *Polytechnic Journal*, an article upon the method of coating metals of all kinds with nickel and cobalt in the wet way, or by boiling; and he thinks that it will be quite possible to imitate the effect of, and even to furnish a satisfactory substitute for, the method by electroplating, which has lately come so generally into use.

The value of nickel plating is, of course, well understood, and it is now very much used wherever polished iron or brass is liable to corrode, as is particularly the case in the vicinity of salt-water. In large yachts, where expense is no consideration, all the metal work, as also the machinery of sea-going steamers, is often treated in this way; a notable instance of which

may be seen in the yacht *Resolute*, a splendid vessel lately built for Mr. A. S. Hatch, of New York.

The details of Professor Stolba's process are too complicated for our pages; but we may say, in general terms, that it depends upon the action of salts of nickel in the presence of chloride of zinc and of the metal to be coated. The substances required are: first, a suitable vessel for conducting the operation, which may be of porcelain or metal; second, a suitable salt of nickel, which may be either chloride, sulphate, or the sulphate of nickel and potassa; third, a solution of chloride of zinc; fourth, clippings of sheet zinc or zinc wire and powdered zinc; fifth, pure hydrochloric acid. Cobaltizing, as Professor Stolba terms it, is conducted in very much the same way—a salt of cobalt being used in place of the salt of nickel.

DURATION OF VISION.

Professor Ogden N. Rood, of Columbia College, in a late number of *Silliman's Journal*, has an article upon the amount of time necessary for vision, and refers to an experiment of Wheatstone's, which seems to show that distinct vision is possible in a period of less than one-millionth of a second. He, however, refers to experiments of his own, by which electric sparks were produced whose duration was only the forty-billionth part of a second; and yet, during their continuance, the letters on a printed page were plainly to be seen; and in polariscope observations the cross and rings around the axis of crystals could be appreciated, with all their peculiarities. He thinks, however, that while this period is sufficient for the production of a strong and distinct impression upon the retina, a smaller interval will suffice for many purposes, and that four-billionths of a second, and, perhaps, even a shorter time, may be sufficient. This, according to the professor, is not so wonderful, if we accept the doctrine of the undulatory theory of light; as, according to it, in four-billionths of a second nearly two and a half millions of the mean undulations of light reach and act upon the eye.

REMOVING THE SMELL OF PETROLEUM.

Professor Stolba publishes what he considers the best method of completely removing from glass or other vessels the smell of any petroleum which may have been previously contained in them. This simply consists in introducing a suitable quantity of milk of lime and shaking it around thoroughly, and, after allowing it to stand for a time, repeating the operation in a few minutes. At the same time the external surface of the vessel is to be washed with a rag dipped in the same substance. Petroleum forms an emulsion with the milk of lime, and can thus be readily removed. If particles of thickened petroleum adhere to the glass, these can be removed by washing with fine sand, or by other mechanical means.

After emptying out the emulsion produced, it is only necessary to rinse with water, after which as much chloride of lime as will go on the point of a knife is to be introduced and shaken with water, and then allowed to stand about an hour, the exterior being rinsed off in a similar manner. If the liquids referred to are used hot, this operation will be materially facilitated.

INJURY OF GREAT BATTLES TO VEGETATION.

A remarkable feature attendant upon the late French-German war is said to have consisted in the destruction of vegetation in the vicinity of the great battle-fields, this being not simply the result of mechanical injuries, but of some more potent agency, and, according to one writer, the result of the enormous mass of powder burned during the battles. As soon as the powder is exploded sulphuric acid is distributed through the atmosphere, and driven forward by the winds until it is carried by rains down into the soil, where it destroys vegetation; the effect being quite similar to that of the same gas as thrown out of manufacturing establishments. As, during the war, many thousand tons of powder were burned, it would be quite easy to understand that an immense number of cubic feet of sulphuric acid must have been thrown off into the atmosphere.

RESEARCHES UPON TOBACCO-SMOKE.

Some recent investigations, by Drs. Vohl and Eulenberg, upon tobacco-smoke are likely materially to modify existing views in regard to the physiological action of the weed. Their paper is divided into three parts, the first of which treats of the chemical composition of commercial tobacco for smoking, for chewing, and snuff; the second contains the results of an examination of the products generated by the combustion of tobacco during smoking; and the third describes the physiological effects of the bases extracted from tobacco-smoke.

Commercial tobacco for smoking purposes was invariably found to contain nicotine, amounting sometimes to 4 per cent. or more, while in tobacco used for chewing and snuff only minute traces of that alkaloid could be detected; so that nicotine poisoning from chewing or snuffing would appear to be very problematical. The authors state that, as a fact, no such cases are on record.

Among the gaseous products given off during the smoking of good tobacco and cigars, there were found oxygen, nitrogen, marsh gas, and carbonic oxide, besides the more readily condensable gases and vapors—sulphureted hydrogen and hydrocyanic acid, and occasionally sulphocyanic acid; this case being produced at a later stage by the action of sulphureted hydrogen on hydrocyanic acid. The acid and non-basic products formed are, formic, acetic, metacetic, butyric, valeric, and carbolic acids; creosote, perhaps caprylic and succinic acids also; the latter from fermentation of the malic acid well known to exist in the green tobacco plant. There are also a solid hydrocarbon and a liquid hydrocarbon of the benzole series.

The most interesting fact in the inquiry was that no nicotine could be detected among the basic products of the distillation, proving that the injurious effects of tobacco-smoking are not to be attributed to this substance; on the contrary, it was in the alkaloids of the pyridin or picolin series, well known to be produced during the destructive distillation of wood and other vegetable products, that the poisonous influences were found. These were tested upon pigeons and guinea-pigs, and were found to produce tetanic spasms, irregular action of the heart, and death. The same bases, obtained from other

sources than tobacco, produced similar effects. As the same pyridin bases are among the products of the distillation of opium, the authors are inclined to attribute the effects produced by smoking this drug not to morphia, but to the picolin series of alkaloids.

PARCHMENT-PAPER.

The use of parchment-paper for the preparation of deeds and other purposes is increasing very rapidly, and is replacing the genuine parchment in a great many of its applications. An improved method of preparing this substance, according to a late article, consists in using the commercial oil of vitriol in an undiluted state. The paper is first passed through a solution of alum, and thoroughly dried, previous to its immersion, thus preventing any undue action of the corrosive principle of the vitriol. After the application of the acid the paper is passed into a vat of water, and then through an alkaline bath, to be again washed. Written and printed paper may undergo this improved process without materially affecting the clearness and distinctness of the letters, and the paper retains all its qualities, even after being wetted several times in succession, while paper prepared in the usual manner loses, to a great extent, its pliancy, and becomes hard and stiff.

STONES IN THE STOMACH OF COD-FISH.

Among the curious things connected with the cod-fish is the frequency with which large stones are found in the stomach. These are of various sizes, sometimes, in a large fish, weighing many pounds; and it is a popular belief among fishermen that these are taken in just before a storm for the purpose of anchoring themselves during the expected swell of the sea. This is supposed to be corroborated by the fact (if it be one) that all the fish taken before a storm agree in this peculiarity, whereas at ordinary times nothing of the kind can be detected.

DIFFERENCE IN GRAVITY OF ISLANDS AND CONTINENTS.

We have already informed our readers in regard to certain experiments that have been prosecuted in India with reference to the determination of the intensity of gravity on an island station as compared with that of one inland, or on the continent, in the same latitude. As the result of observations upon an island west of Cape Comorin, we are informed that gravity on the coast was found to be greater than inland, and at an ocean station like Minicoy greater than on the coast.

CHLOROMETHYL AS AN ANÆSTHETIC.

According to a report by Dr. Rossi, experiments instituted at the University of Padua upon the use of bichloride of methylene as an anæsthetic showed that out of 108 operations in only eight was there any vomiting, and that in every respect this chloromethyl should have the preference over chloroform for surgical purposes, having for the last three years replaced both chloroform and ether in that city. The *London Medical Times and Gazette* gives the experience of Mr. Spencer Wells in 250 operations with this substance, showing a close coincidence in the general results with those of the Italian operators.

BALESTRA ON THE MIASM OF THE PONTINE MARSHES.

Mr. Balestra, in a series of investigations upon the nature and origin of the miasma of the Pontine Marshes, found the stagnant waters filled with organisms of various species, and among them one in particular, which was abundant in proportion to the degree of putrefaction in the water. This is a small alga, which floats on the surface of the water, and presents the appearance of drops of oil. At a low temperature these germinate very slowly; but during the warm weather, and when exposed to the air, they reproduce very rapidly. The author, finding that the addition of a small quantity of arsenious acid, or sulphite of soda, or (still better) of the neutral sulphate of quinine, destroyed the vitality of this plant, infers that the miasma of the marshes is due to its existence and propagation; and that the well-known agency of these medicaments in curing fever depends upon their chemical action upon the plant which causes it, especially as its spores are found to be disseminated every where through the atmosphere. The plant is not developed in a dry season, although it makes its appearance in great quantity during moderately rainy weather occurring in a warm season. The non-occurrence of the fever in the winter, according to the author, is due less to the cold, which prevents the vegetation of the plant or retards the decomposition of organic substances, than to the abundance of the rain, which covers the places where these spores exist, their dissemination into the atmosphere being thereby prevented, and only facilitated by the drying up of the soil, which allows the spores to float readily.

CAUSE OF THE INCREASED EXPLOSIVENESS OF CERTAIN BODIES.

According to *Les Mondes*, the explosive properties of inflammable matter are not dependent on the elevation of the temperature of the atmosphere, but upon its hygrometric state, as explosions take place in winter as well as in summer. Gunpowder during a drought will acquire spontaneous explosive qualities, even without any elevation of temperature, and is more ready to act from the smallest spark. The least quantity of oxalic acid, however, is sufficient to prevent spontaneous action of explosive materials, and without, at the same time, modifying the propelling properties of the powders. Thus if a pulverulent mixture of sulphur and chlorate of potash, or any other combustible substance ready to furnish detonating compounds, be combined with one-third part of oxalic acid, and then heated even to the degree of fusion, there will be no explosion. The action of the acid is believed to have a catalytic influence that precedes the abandonment of the basic particle of water of this substance, any excess of acid being without effect upon the general result. It is suggested that this, if true, will have an important bearing upon the manufacture of explosive substances generally, in reality changing them at will from fulminates to simple explosives.

REPORT OF THE TIDAL COMMITTEE OF THE BRITISH ASSOCIATION.

In the report of a Tidal Committee to the British Association, Sir William Thomson stated that the chief object of the originators of the in-

vestigation was the determination of long-period tides, and particularly the lunar declinational fortnightly tide, and the solar declinational semi-annual tide. The reason for desiring the determination of such tides with great accuracy was that this would give a means of estimating, with absolute certainty, the degree of elastic yielding which the solid earth experienced under the tide-generating influences of sun and moon. It was quite certain that the solid earth did yield to some degree, as it must do so unless it were infinitely rigid. It had long been a favorite assumption of geologists that the earth consisted of a thin shell of solid rock, twenty to fifty miles thick, according to various estimates, inclosing an interior filled with melted material—lava, metals, etc. This hypothesis was, however, untenable, because, were it true, the solid crust would yield with almost as perfect freedom (on account of its thinness and great area) as if it were perfectly liquid. Thus the boundary of the solid earth would rise and fall under the tide-generating influences so much as to leave no sensible difference to be shown by the water rising and falling relatively to the solid; showing that if the earth, as a whole, had an average degree of rigidity equal to that of glass, the tides would be very much diminished from the magnitude corresponding to a perfectly rigid globe, with water like that of our seas upon it. This consideration, he had shown, rendered it probable that the earth had considerably more average rigidity than a globe of glass of the same size. The mathematical calculation showed a somewhat startling result, to the effect that a globe of glass of the same size as the earth, if throughout of exactly the same rigidity as a small glass globe, would yield, like an India rubber ball, with remarkable freedom to the tide-generating influences, thus leaving a very much smaller difference to be shown by water if placed on the surface of such a globe, and estimated in its rise and fall relatively to the solid bottom on which it rested. The precise agreement of precession and nutation, with dynamical estimates founded on the supposition of the earth being perfectly rigid, made it probable that the earth was, in reality, vastly more rigid, as a whole, than any specimen of surface rock, in the condition in which it is when experimented on in our laboratories. The proposed tidal observation and calculation he considers to be the only method which gives directly, and without any possibly doubtful suppositions regarding interior arrangement of density on the earth, a measurement of its elastic yielding to the tide-generating influences.

FLETCHER'S RHYSIMETER.

Mr. Fletcher communicates to the British Association an instrument which he calls the Rhysimeter, intended to indicate the velocity of flowing liquids, and measuring the speed of ships through the water. The principle resembles that of the anemometer of Mr. Fletcher, by which he is able to measure the speed of hot air, flame, and smoke. In both instruments the impact force of the current, and also its tendency to induce a current parallel with itself, are measured, and become indicators of the force and velocity of the stream. A modification of the apparatus is used in measuring

the speed of ships, the indicator, in size and appearance resembling a barometer, being placed in the captain's cabin. The instrument can be made self-registering, marking on a sheet of paper the speed obtained at any instant of time. It is said that it has already been introduced on board some of the larger steamers plying between England and America, and has proved of great value, superseding entirely the crude process of "throwing the log," as it shows at any moment the exact speed of the ship.

PROPOSED CONNECTION OF SCIENCE AND THE BRITISH GOVERNMENT.

Colonel Strange, in view of the want of harmony between the British government and the learned men of the country upon scientific questions, suggests that two additions be made to the ministry: first, a Minister of Science, and second, a permanent Consultative Council, to advise the various departments through the minister.

The duties of the council would be, first, to

advise the government on all questions arising in the ordinary routine of administration submitted to it by the various departments; second, to advise government on special questions, such as the founding of new scientific institutions, and the modification or abolition of old ones, the sanctioning of scientific expeditions, and applications for grants for scientific purposes; third, to consider and decide upon inventions tendered to government for the use of the state; and fourth, to conduct or superintend the experiments necessary to enable it to perform these duties.

COLOMBIAN CURE OF THE BITE OF A POISONOUS SERPENT.

A native of Colombia has lately announced that the bite of a poisonous serpent can be cured by simply dropping melted sealing-wax upon the fang-marks, the result being a slight cautery and a complete exclusion of the air in consequence of the adhesion of the wax.

Editor's Historical Record.

UNITED STATES.

OUR Record is closed on the 24th of November. On the 7th of November elections were held in Massachusetts, New York, New Jersey, Wisconsin, Illinois, Minnesota, Maryland, Virginia, and Mississippi. In each of these States, excepting Virginia, Mississippi, and Illinois, State officers and a Legislature were to be elected. The election in New York resulted in a Republican majority of nearly 18,000—a gain of over 50,000. The State Legislature elected is Republican in both branches by a two-thirds majority. In New York city, with the exception of William M. Tweed, every Tammany candidate for the State Senate was defeated. — In New Jersey, Joel Parker, the Democratic candidate for Governor, was elected by a majority of 6000. The Legislature, however, remains Republican, as last year. — In Wisconsin, Governor Fairchild, the Republican candidate, was re-elected by a majority of over 8000; and Governor Austin, of Minnesota, by a majority of 10,000. — In Illinois, General Beveridge, the Republican candidate for Congressman at large, received a majority of over 14,000. — In Maryland, the Democratic candidate for Governor, W. P. Whyte, was elected by 15,000 majority—a loss of 3000 from the majority of 1870. — In Massachusetts there were four parties in the field. W. B. Washburn (Republican) was elected Governor by a majority of about 14,000 over all. — In Mississippi, the Republican majority was from 15,000 to 20,000.

During the present year elections have been held in twenty-two States, and of these fifteen, with 171 electoral votes, have gone Republican, and seven, with 51 electoral votes, have gone Democratic.

Governor Campbell, of Wyoming Territory, in his Message to the Legislature of that Territory, November 9, advised against the repeal of the woman suffrage enactment.

The President, October 25, appointed General

Thomas W. Bennett, of Indiana, Governor of Idaho Territory, to succeed Governor Bowen, resigned.

Governor Bullock, of Georgia, having resigned his office, was, October 30, succeeded by Benjamin Conly, the President of the State Senate. A special election for Governor was to be held early in December.

Peter B. Sweeny, Commissioner of Public Parks of the City of New York, resigned that office November 1.

Mayor Hall, of New York city, November 18, appointed Andrew H. Green Controller, in place of Richard B. Connolly, resigned.

Thomas Murphy resigned his office as Collector of the Port of New York November 18. The President immediately appointed General Chester A. Arthur his successor.

George H. Boker has been appointed minister to Turkey.

William M. Tweed was arrested in New York October 27. Bail-bonds were filed for \$2,000,000.

The report of the Civil Service Reform Commission was submitted to the President's cabinet by George William Curtis November 10.

Toward the last of October Delegate Hooper, of Utah, sent to the President a petition fifty feet long, in favor of polygamy, signed by about 2500 Mormon women. The petitioners say that their husbands, fathers, sons, and brothers are now being exposed to the murderous policy of a clique of Federal officers intent on the destruction of an honest, happy, industrious, and prosperous people; and they therefore ask for the removal of the Federal disturbers of the peace, or at least to stop the disgraceful proceedings, or send candid and reliable men to Utah to investigate the question of the constitutional rights and liberty of the people.

In the case of the People of the United States in Utah *v.* Thomas Hawkins, the jury, October 20, rendered as its unanimous verdict that the defendant was guilty of adultery, as charged

in the indictment. On the 28th Chief Justice M'Kean sentenced Mr. Hawkins to a fine of \$500 and to imprisonment at hard labor for three years.

The murder of an American citizen by a Chinaman at Los Angeles, California, led to the outbreak of a riot in that place, October 24. Over \$20,000 worth of property was plundered from Chinamen, and a large number of the latter must have been killed, as eighteen bodies of the victims were found.

The first "narrow-gauge" railway in America, a line seventy-six miles in length, has been opened in Colorado, between Denver and Colorado Springs. It has a gauge of three feet, and is the beginning of a road that is to extend south to the Rio Grande River and Mexican boundary. The narrow gauge in these sparsely populated regions, it is thought, will prove profitable.

The violent storm of November 14 proved very destructive to property in the Northeastern States. Houses and trees were blown down; railway communication was interrupted; there were unusually high tides along the coast; and a large number of vessels were wrecked.

In Louisville, Kentucky, on Sabbath evening, November 5, the column supporting the main floor of the African Baptist meeting-house gave way, creating a panic in the congregation. In the struggle to escape from the building nine women and two children were trampled to death.

The steamer *City of New London*, of the Norwich and New York line, was burned to the water's edge, November 22, in the Thames River, five miles below Norwich. Three of the passengers and nine of the crew were drowned after their escape from the burning vessel.

During the fiscal year ending June 30, 1871, the tonnage built within the limits of the grand divisions into which the country is divided was 5631 tons less than for the preceding fiscal year. During the year 1870 the tonnage built on the Atlantic and Gulf coasts was 170,116; in 1871, 150,853 tons. Pacific coast, 1870, 12,720 tons; 1871, 3923 tons. Northern lakes, 1870, 37,258 tons; 1871, 44,377 tons. Western rivers, 1870, 56,859 tons; 1871, 72,139 tons. It will be seen that there has been a marked increase in the tonnage built on the Northern lakes and Western rivers, and a large falling off on the Atlantic, Gulf, and Pacific coasts.

The Grand Duke Alexis arrived off New York November 19. A public reception was accorded him in this city on the 21st. The next day he was presented to the President at Washington by the Russian minister, Catacazy.

The United States District Court of the District of Columbia has decided practically against Mrs. Sarah Spencer's claim to the right of voting, but theoretically in its favor. The various opinions given by the judges of the court indicate that in their view the Fourteenth Amendment has invested woman with citizenship, and that the Fifteenth Amendment has made her a voter every where but in the District of Columbia.

OBITUARY.

The Hon. Thomas Ewing, ex-United States Senator, died at Lancaster, Ohio, October 26, aged eighty-two years.

Major-General Robert Anderson, of Fort Sumter fame, died at Nice, October 26.

General James M'Cleary, member of Congress from Louisiana, died in New York city November 5, aged thirty-four years.

Colonel David Stanton, Auditor-General elect of Pennsylvania, died November 5.

SOUTH AMERICA.

In the Brazilian Parliament, September 27, the bill for the emancipation of slaves was finally passed. The bill immediately emancipates 1650 national slaves. All the children of slaves born after September 28, 1871, are declared free, but the bill subjects them to unpaid service for their labor until they come of age. By its provisions from 5000 to 10,000 slaves will be annually emancipated. Slaves are allowed to acquire property by inheritance or gift, but the power to effect savings by extra work is made dependent on the owner's consent.

EUROPE.

The most important feature of European history during the month is the resignation, October 26, of Count Hohenwart, president of the Council of Ministers, and the other officers of the Austrian cabinet. This event was soon followed by the resignation of Count von Beust, the imperial chancellor.

In order to understand the situation of the Austrian empire, as connected with these events, we must briefly allude to the Austrian constitution and government, as these have existed since 1867. The changes then and since introduced have been due to the influence of Count von Beust in the imperial councils. Only five years ago Count von Beust was premier of Saxony. He came to Austria as an exile after the victory of Prussia in the memorable campaign of 1866. Austria, defeated, with Venetia lost, and with discontent in Hungary and the other provinces, adopted the fugitive. On the 30th of October, 1866, Francis Joseph appointed him Secretary of Foreign Affairs, and committed to him the task of reorganizing the empire. The most important measure undertaken by him was the conciliation of Hungary. The autonomy of Hungary was granted—i. e., that province was granted its own parliament, ministry, and government. June 8, 1867, Francis Joseph became King of Hungary under the new constitution, receiving the crown of St. Stephen. The alliance thus gained by the Austro-Germans, who in Cisleithan Austria constituted only thirty-eight per cent. of the population, was of the greatest importance, for the Hungarians were as much interested in resisting the pretensions of the Bohemian Czechs and the other Slavonians of the empire as were the Austro-Germans themselves.

But, notwithstanding this alliance of the Magyar interest with the German, it seems still a question whether it will prove sufficiently strong to resist the operation of forces which threaten the dissolution of the empire. Bohemia, the most powerful province of Cisleithan Austria, demands the autonomy that has been granted to Hungary. The emperor has been vacillating. At first, led by Count Hohenwart, he seemed inclined to concede to the demands of Bohemia. But the opposition of the Germans compelled him to retrace his steps. The Reichsrath revolted from the policy of concession, as involving in the end the inevitable dissolution of the

empire. Then the Hohenwart ministry resigned. The efforts of the emperor have since been directed to the maintenance of the constitution as it now stands. He placed Von Kellersperg, formerly governor of Bohemia, at the head of his cabinet, with instructions to meet the demands of the Bohemians and of other disaffected provinces by a tender of terms compatible with the essential principles of the constitution, and to be discussed in the Reichsrath, to which Bohemia and all the other provinces are expected to send their representatives. The Bohemian Diet, following the example of Hungary in 1866, refused to elect representatives to the Reichsrath. The imperial government then issued a decree (received at Prague November 16) ordering the immediate election of members of the Reichsrath directly by the people of Bohemia.

Count von Beust has been so intimately associated with the German interest that his resignation of the chancellorship will have a conciliatory tendency, although the policy by which he has been guided will also influence his successor, Count Andrassy, formerly Hungarian Secretary of Foreign Affairs.

Field-Marshal Ludwig Benedek, commander-in-chief of the Austrian army in the memorable battle of Sadowa, died at Gratz, Styria, October 25.

The members of the Council General of Corsica did not elect Prince Napoleon for their president. He was present in the Council October 24, but the members would not listen to him. His partisans protested against the elections as "not conducted in a manner to allow a free expression of the wishes of the people."

The French army is being reorganized into ten army corps, consisting altogether of about 350,000 men, besides cavalry and artillery.

President Thiers insists upon modifications in the Anglo-French commercial treaty of 1860, restoring to the French tariff its old protectionist character. Owing to the alterations proposed by France in the treaty of 1860, some information has been collected by the Cobden Club bearing on the commercial policy of France, from which we take the following: "In 1859 the special commerce of France, imports and exports combined, amounted to 3,907,000,000 francs, or £156,280,000, to which aggregate amount the following countries, with which treaties have since that time been concluded—viz., England, Belgium, Germany, Switzerland, Austria, and Holland—contributed 1,697,000,000 francs, or £67,880,000. In 1866 the special commerce of France amounted to a value of 6,229,000,000 francs, or £249,160,000, to which the above-mentioned countries contributed 3,175,000,000 francs, or £127,000,000, against 1,697,000,000 francs, or £67,880,000, as before stated, in 1859; showing an increase of 1,478,000,000 francs, or £59,120,000. Italy has been expressly excluded, owing to the difficulty of making an accurate comparison between the trade of that country, when it was composed of several distinct states, and when it forms, as it now does, an independent commercial unit. The development of the foreign trade of France under the policy of recent years has been attended necessarily by a large increase in the tonnage engaged in it; and although the principal part of this increase consists of foreign shipping, there has been a very

marked progress in the employment of French tonnage also in the foreign trade of France, as well as in her colonial trade; the national tonnage engaged in the coasting trade—a trade, be it observed, which, with some unimportant exceptions, is exclusively reserved to French navigation—having, on the contrary, declined. French trade with England forms about one-fourth of the whole foreign trade of France, while English trade with France forms only about one-tenth of the whole foreign trade of England.

A terrible colliery explosion occurred in a mine near St. Etienne, France. Fifty-two miners were in the pit, all of whom are reported to have lost their lives.

The Russian army, though by far the strongest of European armies in point of regiments, is only prospectively so in point of men. In case of war no more than 783,000 men, with 1572 guns, could, according to present arrangements, be concentrated on the western frontier. As a considerable portion of these would be required for garrison duty and frontier service, no more than from 500,000 to 600,000 would remain available for campaign service. As Germany has 1,000,000 of men at the lowest, Austria 800,000, and Turkey 700,000, that is by no means a formidable force for so colossal an empire. The defect will, however, be remedied, and a just proportion between area and army established, by the army reorganization sanctioned last year and now in progress. By this means the regular available army will be soon increased to 1,234,460 men, with 2488 guns, exclusive of fortress and dépôt garrisons, marching detachments to relieve the active troops, and the whole army of the Caucasus. The marching detachments are calculated at 255,000 men, the remainder of the army at 1,603,000 men, and the militia and reserves available in time of war would swell this force to the colossal number of 3,500,000.

A fire broke out in Geneva, Switzerland, November 13. The Rue Rhone was laid in ruins.

A colliery explosion took place at the Seaham mine, near Newcastle, England, October 26, resulting in great loss of life.

The convention between Switzerland and a combination of German banks and firms for the construction of the St. Gothard line was perfected October 10. The various governments grant a subsidy of 85,000,000 francs; the company to find the remaining 102,000,000 francs.

The Belgian government has forwarded \$20,000 to America for the relief of the Belgian settlers in Wisconsin who have suffered by the forest fires. The government has also opened a subscription for voluntary contributions for the same object.

The whaling fleet in the arctic seas has met with a great disaster. In September last, while chasing an immense school of whales beyond Cape Behring, the fleet was hemmed in by ice-floes, some of the vessels being sunk at once or driven ashore. Finding their lives in imminent peril, the captains concluded to abandon all the vessels most dangerously situated, and betake themselves to those that had a chance of getting out safely. This they did, and arrived at Honolulu safe. The number of whalers lost is thirty-three. The loss of property is estimated at \$1,500,000.

Editor's Drawer.

ONE of the genialest of the old British essayists, Richard Cumberland, on the last day of the year 1789, took up that delightful pen of his, and wrote the two paragraphs that follow, expressing with greater beauty than can be whose pleasant duty it is to prepare the monthly Drawer for "dear old *Harper*," the feeling that comes upon him on entering the new year:

I am sitting down to begin the task of adding a new volume to these essays when the last day of the year 1789 is within a few hours of its conclusion, and I shall bid farewell to this eventful period with a grateful mind for its having passed lightly over my head without any extraordinary perturbation or misfortune on my part suffered, gently leading me toward that destined and not far distant hour when I, like it, shall be no more.

I have accompanied it through all those changes and successions of seasons which, in our climate, are so strongly discriminated—have shared in the pleasures and productions of each; and if any little idle jars or bickerings may occasionally have started up betwixt us, as will sometimes happen to the best of friends, I willingly consign them to oblivion, and keep in mind only those kind and good offices which will please on reflection, and serve to endear the deceased.

In Cumberland's time flourished a Scotch poet named Grahame, who, having a wee bit word to say of New-Year's, said it thus:

Long ere the lingering dawn of that blithe morn
Which ushers in the year, the roosting cock,
Flapping his wings, repeats his larum shrill;
But on that morn no busy flail obeys
His rousing call; no sounds but sounds of joy
Salute the ear—the first-foot's entering step,
That sudden on the floor is welcome heard,
Ere blushing maids have braided up their hair:
The laugh, the hearty kiss, the *Good New-Year*
Pronounced with honest warmth.

The grandam eyes
Her offspring round her, all in health and peace;
And thankful that she's spared to see this day
Return once more, breathes low a secret prayer
That God would shed a blessing on their heads.

Not many notable things have occurred on New-Year's Day. Four, however, may be mentioned:

On the 1st of January, 1308, William Tell associated himself with a band of his countrymen against the tyranny of their oppressors. For three hundred and forty years the opposition was carried on, and terminated by the treaty of Westphalia, in 1648, declaring the independence of Switzerland. Thanks to that apple business and the opera, W. T.'s name is kept pretty green.

On the 1st of January, 1651, Charles II. was crowned at Scone King of the Scots; and

On the 1st of January, 1800, was formally consummated the union of Great Britain and Ireland; and

On the 1st of January, 1801, Piazza, the astronomer at Palermo, discovered a new primary planet, the first of the asteroids, which he called Ceres.

So much for statistics.

Now for the regular thing!

In the "Life of Catharine M. Sedgwick," recently published by Harper and Brothers, we find an anecdote, told by her father with much gusto, of Dr. Bellamy. One of Dr. B.'s parishioners, who was a notorious scamp, came to him, saying, in the parlance of the divinity that per-

vaded Berkshire County at that period, "I feel that I have obtained a hope!" The doctor looked surprised. "I realize that I am the chief of sinners," continued the hypocritical canter. "Your neighbors have long been of that opinion," rejoined the doctor. The man went on to say out the lesson: "I feel willing to be damned for the glory of God." "Well, my friend, I don't know any one who has the slightest objection."

Another anecdote of the same divine: One of his church was up before that solemn tribunal for some profane words spoken in wrath. He was a man liable to be provoked to a sudden gust of passion by a scamp, but tender and cherishing as a June dew to the widow and fatherless. After hearing the evidence of his accusers, Dr. B. said: "The poor man is a grievous sinner on one side, but, my friends, I think he has more of the milk of human kindness in his heart than all the rest of my church together!"

In the same volume is this anecdote of Washington, now first published:

"I have heard my father relate an instance of the repelling dignity of Washington's manner on an occasion when it was proper for him to repress familiarity. Gardoqui, the Spanish minister, at one of the general's levees, advanced from the crowd, and, with an air perfectly easy and familiar, slipped his arm within the general's, and began to whisper to him. He only began, for Washington shook him off with a look that would have awed temerity itself. Gardoqui shrank back into the crowd, and paid the penalty of his forwardness in silence and shame."

In September, 1828, Miss Sedgwick went to the celebration of the two hundredth anniversary at Salem. "Judge Story was very sensible and animated, and did not tire us with a two hours' harangue. We dined at his house. Old Dr. Holioko, a man past his hundredth birthday, walking firmly and erect, and looking like the representative of far-gone ages, was present, and gave great interest to the scene. At the dinner Judge Story held up a large pewter platter, a relic which belonged to the first settlers, filled with an indifferent pear, called the Endicott pear, planted by the first governor, Endicott. 'Here,' he said, 'is what the Pilgrims had;' and then, elevating an elegant silver basket filled with nectarines, peaches, and grapes, 'Here,' he said, 'is what their children have.'"

In her childhood the only political parties in the country were Democrats and Federalists. Miss Sedgwick, naturally enough, thought every Democrat was grasping, dishonest, and vulgar, and would have in good faith adopted the creed of a stanch old parson, who, in a Fast-day sermon, said, "I don't say that every Democrat is a horse-thief, but I do say that every horse-thief is a Democrat!"

How good this! Writing to Mrs. S. K. Minot in 1846, Miss Sedgwick says: "Last evening I was apologizing to Mr. Field for playing cards in his presence, and said I hoped he was not of the opinion of a certain gentleman in New York, who had written to entreat I would change the game of marbles (mentioned in my little tract

as, of course, one of the boys' plays) to kite, because marbles were immoral, as by betting they involved an appeal to God, as did cutting and dealing cards, it being all regulated by the interposition of Providence. 'So,' said Mr. Watts, 'is cutting wood, especially Billy Brogan's; for, when he lifts up his axe, Heaven only knows where it will strike!'"

Alluding to the financial crisis of 1837, Miss Sedgwick says: "How we are to get out of this hobble I know not; but if we are true to ourselves, I am sure it will be, as the old women say, a *sanctified* Providence. The exclusive love of riches must abate when their uncertainty is so proven. Men must learn the worth of those acquisitions, those fountains of respectability and happiness, that are independent of the fluctuations of the money market; that a man need not look at the price of stocks to graduate his enjoyment of the caresses of his children, the pleasure of a good new book, or the enjoyment of nature on one of these exquisite spring days; that he need not speculate to relish a simple dinner; that Champagne and *pâté de foie gras* are not essential to his happiness, nor blonde nor Mechlin to his wife, nor Italian and music to his daughters. I wrote a little article for John O'Sullivan, editor of the *Democratic Review*, called 'Who and What has not Failed,' which, it seemed to me, showed a great balance in favor even of the real bankrupts."

A FEW good things (about all there are) from "The Literary Life of the Rev. William Harness:"

Among the distinguished persons with whom Mr. Harness was acquainted, he not unfrequently met the celebrated Sheridan. He was present at some of the sumptuous entertainments with which the dramatist regaled his friends, and remarked that, although his guests denounced his extravagance, they never refused his invitations. Sheridan was not devoid of that vanity which so often accompanies talent. On one occasion, at a Theatrical Fund dinner, he made a very high-flown speech, in which he spoke of himself as being "descended from the loins of kings!" "That is quite true," said Dr. Spry, who was sitting next to Harness. "The last time I saw his father [an actor] he was the King of Denmark."

Sheridan's solicitor found his client's wife one day walking up and down her drawing-room, apparently in a frantic state of mind. He inquired the cause of such violent perturbation. She only replied "that her husband was a villain." On the man of business further interrogating her as to what had so suddenly awakened her to a sense of that fact, she at length answered, with some hesitation, "Why, I have discovered that all the love-letters he sent me were the very same as those he sent to his first wife!"

Rogers, the poet, seems to have been somewhat unfortunate in his servants. On one occasion, when in the country, his favorite groom, with whom he used to drive every day, gave notice to leave. Rogers asked him why he was going, and what had he to complain of. "Nothing," replied the man; "but you *are* so dull in the buggy."

Speaking of France brought him to the fol-

lowing story, to which he gave considerable effect: "An Englishman and a Frenchman had to fight a duel. That they might have the better chance of missing one another, they were to fight in a dark room. The Englishman fired up the chimney, and, by Jove! he brought down the Frenchman! When I tell this story in Paris," observed Rogers, "I put the Englishman up the chimney."

Mr. Harness had many other little interesting scraps about Rogers. The poet greatly disliked letters of condolence, and when he had that melancholy duty to perform, he generally copied one of Cowper's. Lord Lansdowne once spoke to him in congratulatory terms about the marriage of a common friend. "I do not think it so desirable," observed Rogers. "No!" replied Lord Lansdowne. "Why not? His friends approve of it." "Happy man!" returned Rogers; "to satisfy all the world. His friends are pleased, *and his enemies are delighted!*"

Moore was a friend of Rogers's, and also of Mr. Harness's. Speaking of Moore's taste for biography, and the number of memoirs he had composed, Rogers one day cynically observed, "Why, it is not safe to die while Moore is alive!"

At Mrs. Siddons's receptions Mr. Harness became acquainted with Theodore Hook, who was then in general request in fashionable and literary society. His love of merriment sometimes caused him to indulge in pleasantries which, though sufficiently harmless in themselves, verged too closely upon the limits of propriety. One evening Mr. Harness, who shared the prejudices then entertained about waltzing, observed to Theodore that he was glad to hear that he disapproved of the new dance. "Well, I don't know about that," returned his friend; "'tis a mere matter of *feeling*."

Among Mr. Harness's more intimate friends was the millionaire Hope, author of "Anastasia." He frequently invited him to Deep Dene, where Mr. Harness found himself surrounded by the talent and wealth of England. The tone of the conversation sometimes amused him much; as when Rothschild observed to Hope that a man must be "a poor scoundrel who could not afford to lose two millions."

One day, at Deep Dene, Mr. Harness found the tutor of Mr. Hope's sons pacing up and down the room in the most distressing agitation of mind. "Is there any thing the matter?" inquired Mr. Harness, anxiously. "The matter!" he replied; "I should think there was! Three of the worst things that can possibly happen to a man: I'm in love, I'm in debt, and I've doubts about the doctrine of the Trinity!"

There was as much careless freedom in Talfourd's household as in that of most men of genius; Goldsmith himself could not have desired a more entire absence of conventionality. One day, when Mr. Harness was dining at their house, in company with several judges, the Sergeant and Mrs. Talfourd sat through dinner each with a cat in the lap. On another occasion Mrs. Talfourd requested him to carve a chicken which was placed before him. He essayed to comply, but on his making the attempt the bird spun round and shot off the dish. Mr. Harness, on examining the cause of it, found that he had been given a fork with only one prong! "Will you be so good as to cut that tart before you?"

said the hostess to another guest. "Certainly, if you desire it," was the reply; "but perhaps you are aware that it has not been in the oven?"

The Bishop of Exeter was remarkable not only for erudition, but for that social tact and elegance which rarely accompany it. One day his lawyers were dining with him, and he wished his wife to retire from the table early, that he might discuss with them his course of action in one of those unfortunate suits in which he was so constantly involved. The lady, however, found the legal gentlemen agreeable, and notwithstanding repeated nods and winks and hints from her lord, remained immovable in her place. At length she understood his meaning, and rose hurriedly to depart. "What! so soon, my love?" demanded the bishop, blandly, as he opened the door for her with an obsequious bow.

Conversing with Bishop Selwyn, then of New Zealand, and recently a visitor to this country, Mr. Harness asked him whether his ministry had been attended with success. "With very little, I grieve to say," was the reply. "A short time since I thought I had brought to a better state of mind a man who had attempted to murder a woman, and had been condemned to death. He showed signs of contrition. I gave him a Bible, and he was most assiduous in the study of it. He gave altogether such a promise of reformation that I exerted myself and obtained for him a commutation of sentence. I called to inform him of my success. His gratitude knew no bounds; he said I was his preserver, his deliverer. 'And here,' he added, as he grasped my hand in parting—'here is your Bible. I may as well return it to you, for I hope that I shall never want it again.'"

A country rector, coming to preach at Oxford, in his turn, complained to Dr. Routh, the venerable principal of Magdalen, that the remuneration was very inadequate, considering the traveling expenses, and the labor necessary for the composition of the discourse. "How much did they give you?" inquired Dr. Routh. "Only five pounds," was the reply. "Only five pounds!" repeated the doctor. "Why, I would not have preached that sermon for fifty."

At a dinner-party a somewhat dull couple, who affected literature, informed their friend that they were going to visit the city of Minerva. Mr. Harness, who happened to be sitting next to the humorous Jekyll, heard him mutter to himself, "To the Greeks—foolishness!"

FROM an English paper received by last steamer we quote the following anecdote of Mr. Disraeli and an Irish member, and can imagine the delight it gave the ex-Prime Minister:

A genuine Hibernian, of somewhat colorless politics, was returned by an obscure Irish constituency, and on his arrival at St. Stephen's the "whips" of both parties were anxious to secure him as a supporter. Toward this end Viscountess Beaconsfield (then Mrs. Disraeli) sent him an invitation card. During the evening the company got dispersed into groups, in one of which were Disraeli and the new member, who had been thoroughly overpowered by the brilliant conversation and elegant condescension of his host, to whom, by way of compliment, he said, in the purest brogue, "I have never read your

novels myself, but my daughters have, and, be-dad, they say they're mighty clever!"

"Sir," said Disraeli, drawing himself up, and looking his admirer full in the face, "that is fame."

THIS from a Missouri correspondent:

One of our leading attorneys commenced practice at the Kingston (Caldwell County, Missouri) bar at the close of the late unpleasantness. He had gained a commission, and thought he could do with the world about as he pleased. He had brought suit against a party who disrespectfully died before our legal friend could get service of process on him. Nothing daunted, he came into court, and suggested that the death of the defendant be entered upon record, and asked for an order of publication. The judge smiled blandly, and raising one eye meditatively to the ceiling, asked, "Mr. —, do you think the *Caldwell County Banner of Liberty* circulates where *this* defendant has gone?"

OUR Episcopal brethren will appreciate this, from a late English book: The Bishop of Oxford having sent round to the church-wardens in his diocese a circular of inquiries, among which was, "Does your officiating clergyman preach the Gospel, and is his conversation and carriage consistent therewith?" the church-warden of Wallingford replied, "He preaches the Gospel, but does not keep a carriage."

THE Rev. Mr. P—— is well known to the citizens of — as a decidedly eccentric person, but zealous and full of good works. A short time since he met at the house of a friend Dr. K——, the leading physician of the same city. While chatting after dinner, the parson asked the doctor as to the reality of the ailments of one of his parish dependents, a Mr. George Washington Haynes Tibney. Whereupon, the peculiarities of this person being spoken of, the doctor related he had on one occasion been asked by him for the gift of a dollar. He replied that he had no money to give. Mr. G. W. H. T. persisting, the doctor finally gave him a fifty-cent stamp. Mr. Tibney looked at it contemptuously, and handed it back, saying, "I guess you need this, doctor, more than I do. I never take less than a dollar."

"Then," continued the doctor, "I took him by the nose, and, leading him to the door, kicked him out of my office."

"Did you kick him, doctor?" cried the excited Mr. P——. "Did you really kick him? Oh, I am so glad, as I have often, often felt like kicking him myself!"

BELOW will be found a careful compilation of the various nicknames given to the States and people of this republic, valuable for reference: Alabama, Lizards; Arkansas, Toothpicks; California, Gold-Hunters; Colorado, Rovers; Connecticut, Wooden Nutmegs; Delaware, Muskrats; Florida, Fly-up-the-Creeks; Georgia, Buzzards; Illinois, Suckers; Indiana, Hoosiers; Iowa, Hawkeyes; Kansas, Jayhawkers; Kentucky, Corn-Crackers; Louisiana, Creoles; Maine, Foxes; Maryland, Craw-Thumpers; Michigan, Wolverines; Minnesota, Gophers; Mississippi, Tadpoles; Missouri, Pukes; Ne-

braska, Bug-Eaters; Nevada, Sage-Hens; New Hampshire, Granite Boys; New Jersey, Blue Hen's Chickens, or Clam-Catchers; New York, Knickerbockers; North Carolina, Tar-Boilers, or Tar-Heels; Ohio, Buckeyes; Oregon, Web-Feet; Pennsylvania, Pennites, and Leather-heads; Rhode Island, Gun-Flints; South Carolina, Weasels; Tennessee, Whelps; Texas, Beef-Heads; Vermont, Green Mountain Boys; Virginia, F. F. V.'s; Wisconsin, Badgers.

A GENTLEMAN has recently contributed to *Notes and Queries* the following *jeu d'esprit* on Lord Eldon's well-known habit of doubting. It was written by Sir George Rose:

A CHANCERY SUIT.

Mr. Leach made a speech,
Impressive, clear, but wrong;
Mr. Hart, on t'other part,
Was tedious, dull, and long;
Mr. Parker made that darker
Which was dark enough without;
Mr. Bell spoke so well
That the chancellor said, "I doubt."

MR. CHARLES H. WEBB, whose witty productions have frequently appeared in the publications of Harper and Brothers, has discarded literature to devote himself to making large sums of gold in Broad Street. After Mr. Evans returned from Brazil, some two years ago, and published three brilliant articles on that country in *Harper's Magazine*, Evans met Webb, and narrated some of his hunting exploits—how he had bagged monkeys, tapirs, etc.

"Are you a good shot?" asked Webb.

"Oh, I can snuff a candle," was the reply.

"That's why you went out there to practice on *tapirs*," said Webb.

A certain United States judge, a scholarly man and brilliant conversationist, but noted as an interminable talker, one day said, "There's Webb, now, a clever fellow, a brilliant fellow; what a pity he has an impediment in his speech!" On hearing it, Webb observed, "There's Judge——; he's a clever fellow, a brilliant fellow; what a pity that he hasn't!"

Three or four years since, when it was thought that General Butler would be pushed for the Presidency, Webb quoted:

"Of all the sad words of tongue and pen,
The saddest are 'We may have Ben.'"

"You don't think I'll ate with a nagur?" asked the cook, when a colored waiter was engaged.

"I don't know," answered Webb, "I'll speak to him, and see if he has any objections."

FATHER FOLEY, parish priest in a New England fishing town, was a clergyman much beloved by his own flock, and well liked by "the heretics" likewise, for his genial manners and capital stories. His reverence, though, of course, a strict disciplinarian, went not a step further than the letter of the law allowed. He was far from ascetic in his religious devotion, being a jolly lover of good living, and by no means averse to a glass of "something hot," when paying a visit to a member of his parish. On one of the fast-days—a cold, bleak one, too—Father Foley, on his way from a distant visitation,

dropped in to see Widow O'Brien, who was as jolly as himself, and equally as fond of the creature comforts, and, what is better, well able to provide them. As it was about dinner-time, his reverence thought he would stay and have a "morsel" with the old dame; but what was his horror to see served up in good style a pair of splendid roast ducks!

"Oh, musha! Mistress O'Brien, what have ye there?" he exclaimed, in well-feigned surprise.

"Ducks, yer riverence."

"Ducks! roast ducks! and this a fast-day of the holy Church!"

"Wisha! I never thought of that; but why can't we ate a bit of duck, yer riverence?"

"Why? Because the Council of Trent won't lave us—that's why."

"Well, well, now, but I'm sorry fur that, fur I can only give ye a bite of bread and cheese and a glass of something hot. Would that be any harrum, Sir?"

"Harrum! by no manes, woman. Sure we must live any way, and bread and cheese is not forbid."

"Nayther whisky punch?"

"Nayther that."

"Well, thin, yer riverence, would it be any harrum fur me to give a toast?"

"By no manes, Mrs. O'Brien. Toast away as much as ye like, bedad!"

"Well, thin, *here's to the Council of Trint, fur if it keeps us from atin', it doesn't keep us from drinkin'!*"

No one enjoyed this story better than Father Foley himself, who never tired of telling it.

WE are indebted to a Concord, Massachusetts, correspondent for the following account of an old lady's first ride in the cars:

Miss Prudence Pettingill, at the mature age of sixty-one, made up her mind to visit New York for the first time in her life. She had never seen a railroad, as such things had been unknown in Aroostook County until this summer, and the ancient farm-house in which she lived was seven miles from the station. So she sits calmly upon a seat placed on the great wooden platform which surrounds the country dépôt, and gazes with amazement upon the train which arrives, pauses a few moments to take on passengers, and then proceeds upon its journey. The station-master interrogates the old lady, who sits placidly watching the departing train.

"Why did you not get on, if you wished to go to New York?"

"Git on!" says the old lady—"git on! I thought this whole consarn went!"

Having explained to her that the platform was stationary, the man kindly advises her to wait for the express train, into which he escorts the maiden, and finds for her a seat by the side of a benevolent old gentleman. Clutching fast hold of the seat in front of her, she is at first very much alarmed at the speed at which they are going, but gradually becomes calm, and much interested in the novelty of her surroundings. The old gentleman answers her many inquiries very civilly, and, among other things, tries to explain the use of the telegraph wires, and tells her that messages are sent over them at a much greater rate of speed than they are traveling. "Wa'al, wa'al," says the old lady, "you don't

ketch me a-ridin' on 'em, for this is as fast as I want to go, anyhow." She has seen so many wonderful things that she makes up her mind at last not to be astonished at any thing; and when the train dashes into the one which had preceded it, owing to a misplaced switch, and the poor old lady is thrown to the end of the car among a heap of broken seats, she supposes it to be the ordinary manner of stopping, and quietly remarks, "You fetch up rather suddin, don't ye?" Being provided with a seat in the forward car, which was uninjured, she arrives without farther accident at her journey's end, and is surrounded by an eager crowd of hackmen, and listens in wonder to their oft-repeated call of "Hack! hack!" Grasping her umbrella in one hand and her handbox in the other, she looks down into the face of the loudest driver with the compassionate inquiry, "Air you in pain?" From the consequences of his wrath she is rescued and carried safely home by her nephew, who has come to the dépôt to look for her.

SCENE in the cars:

A candy-boy, passing through a car, meets a cross old gentleman, and says, "Pop-corn! pop-corn!"

"Hain't got no teeth," angrily replies the man.

"Gum-drops! gum-drops!" calls the smart boy.

At the close of the trial of that bad Dr. Rosenzweig, before Judge Hackett, a gentleman who happened to be seated by the side of the Court was moved to quote from an old English author a verse that was, many years back, written for a precisely similar case:

The learned recorder,
In luminous order,
Put the facts like a logical reasoner;
The jury thought fit
To consider a bit,
And then—they convicted the prisoner.

A SAN FRANCISCO correspondent writes:

Your story of Brother Rooney, in the October Drawer, reminds me of a veritable fact that happened to our new Governor in the last Presidential campaign. A mass-meeting was to be held at Gilroy, California, and there was a great gathering. The boys improvised a battery of artillery out of a couple of old anvils. As soon as it was dark the battery opened fire—one for Grant and Colfax, the other for Seymour and Blair. The first boomed finely, followed by three cheers for Grant; the other flashed in the pan, and a few voices piped, "'Rah for Seymour!" After a while the magnates appeared, the meeting was organized, and old Colonel Hanson, the chairman, doing his level best to introduce the speaker, when—bang! went the big gun, and three cheers for Grant. Fizz! went the little fellow, and three for Seymour. The colonel drew himself up to about six feet seven, and looking away over the crowd, and evidently forgetting his prepared speech, said:

"If our Democratic friends will not disturb the meeting, I will feel obliged to them. One jackass is enough at a time. Gentlemen, the Honorable Newton Booth!"

A TRAVELED gentleman sends us the following, which is to be found in the entrance-way of

a hotel at Lahore. It seems to be an honest and laudable purpose of the landlord satisfactorily to "fix things" between his guests and himself. Some of his ideas could be advantageously acted upon in this region:

Gentlemen who come in hotel not say any thing about their meals they will be charged for and if they should say beforehand that they are going out to breakfast or dinner, &c., are if they say that they have not any thing to eat they will not be charged, and if not so, they will be charged, or unless they bring it to the notice of the manager of the place, and should they want to say any thing, they must order the manager for and not any one else, and unless they bring it to the notice of the manager, they will be charge for the least things according to hotel rate, and no fuss will be allowed afterward about it. Should any gentleman take wall lamp or candle light from the public rooms they must pay for it without any dispute its charges. Monthly gentlemen will have to pay my fixed rate made with them at the time, and should they absent day in the month they will not be allowed to deduct any thing out of it, because I take from them less rate than my usual rate of monthly charges.

FROM an article in a late English magazine on "Our Judges," we quote a few anecdotes of the British judges, prefacing them with a strange remark made one day by Lord Campbell to Chief Baron Pollock. At that time they were both members of the House of Commons. "Pollock," quoth Campbell, "we lawyers receive the highest wages of an infamous profession." The writer truthfully adds, "It is a sad thing for a lawyer—a sad thing for any man—when he does not believe in his own work."

A prosecutrix in a criminal case at the Suffolk Assizes resorted to the expression, "I said to myself," so frequently as to excite some merriment.

"Mrs. Taylor," said the Chief Baron, "you must not tell us what you said to yourself, unless the prisoner was by."

Baron Alderson—learned, gentle, and good—could make puns, and had much drollery. A jurymen once said that he was deaf in one ear.

"Well, then," said Alderson, "you may leave the box, for it is necessary that jurymen should hear both sides."

Sometimes, when two courts are close together, the disagreeable circumstance happens that a counsel thunders so loudly in one court that he disturbs the business of the other. Once, at Buckingham, a chief justice addressing the grand jury heard a tremendous row in the civil court. Asking what the noise was, he was told that Sergeant — was opening a case.

"Very well," said he; "since Brother — is opening, I must shut up;" and ordered all the doors to be closed.

The judges can tell odd stories of going circuits. The functionaries, and sometimes even the prisoners, are much disgusted if, instead of a Westminster judge, they have to deal with some counsel whose name has been included in the Commission. A prisoner for murder was greatly annoyed because he had to be tried by a "journeyman judge." A sheriff once told a judge that they had been "often jobbed off with sergeants instead of judges in those parts, and was he really a *bona fide* judge?" Having had his mind satisfied on this point, the sheriff gracefully took his place by the side of the judge on the back seat, but was politely informed by the judge that etiquette required that he should sit opposite.

Once a judge complimentally told a mayor that he presided over an ancient city.

"Yes, my lord," was the answer; "*it always* was an ancient city."

We expect it was the same gentleman who expressed a hope that Mrs. Judge and all the little Judges were well.

A sheriff asked a judge at a circuit dinner if he had gone to see the elephant in the last place.

"Why, no, Mr. High Sheriff," he replied, "I can not say that I did, for a little difficulty occurred; we both came into the town in form, with the trumpet sounding before us, and there was a point of ceremony to be settled which should visit first."

A judge who was summing up a case was greatly disturbed by a young counsel who was talking aloud. With great benignity, he said,

"Mr. Gray, if you ever arrive here, which some of these days I hope you will do, you will know the inconvenience of counsel talking while you are summing up."

A curious story is told, illustrating the legal precision of a great judge. He asked a magistrate at a circuit dinner whether he would take some venison. The gentleman answered,

"Thank you, my lord, I am going to take boiled chicken."

Lord Tenterden retorted,

"That, Sir, is no answer to my question; I ask you again if you will take venison, and I will thank you to answer *yes* or *no*, without further prevarication."

The story was originally told in the *Quarterly Review*, but it is challenged by Lord Campbell.

The most upright and impartial judges, who endeavor to keep their judgment perfectly balanced, are liable, human nature being what it is, frequently, and perhaps insensibly, to take a side. Some judges have left it on record that when a case has been fairly opened, and the testimony was given clearly, honestly, and in a pleasing way, they had made up their minds on one side before they heard the other. Mr. Grote discusses this subject in one of the admirable notes to his immortal history. Wise judges watch against this tendency, and are able to conquer it. Still, in the case of any protracted trial, it is easy to see on which side the judge's opinions rest, and even his sympathies. With some judges the habit of advocacy has grown so inveterate that they have been quite unable to lay it aside. If ever they have seriously tried, they have not succeeded in the attempt. The case has even been known of a judge on the bench thundering like an advocate at Nisi Prius. A judge once said that he had only *lost two verdicts* since he had been raised to the bench. What one likes to see in a judge is, a quiet, vigilant watchfulness, the alert eye, the unwearying hand, the thoughtful, composed manner. I have seen cases where, except to the initiated, the judge seemed little more than a passive spectator for a considerable portion of the case—but he would have interfered at any moment—and when his proper time came he showed how complete had been his grasp of the case, and how acute his attention to all details. An able judge once said, "Nobody knows how much energy it requires in a judge to hold his tongue." The most conspicuous example of an intellectual failure in fairness was Sir John Leach. He de-

lighted to gallop through his cases. He was so fast that a stage-coach was named after him "The Vice-Chancellor."

We have culled these few anecdotes for the entertainment of our brethren of the bench and bar, to whom we may say, in the last words of that great Chief Justice Lord Tenterden, "Gentlemen of the jury, you may now retire and consider your verdict."

THE person and feelings of a clergyman have in every civilized country been regarded with respect, while any attempt to injure the one or the other has been visited with reprehension. But the church courts have not always left to magisterial punishment those who assailed the members of their body. Mr. William Russel, minister of Kilbirnie, complained to the presbytery of Irvine that one of his parishioners had denounced his doctrine as "dust and gray meal." The presbytery ordained the delinquent to humble himself on his knees at the presbytery table, and thereafter to indicate repentance next Sunday on the stool in Kilbirnie kirk.

THE Rev. William Coupar, Presbyterian minister at Perth, attained considerable popularity among his people, who were proportionately disappointed when he accepted the bishopric of Galloway. In his official residence, in the Canon-gate of Edinburgh, he was visited by an old woman from Perth, who had been much attached to his ministrations. She was ushered into his parlor, where the new-fledged bishop was seated in his episcopal vestments. It was dusk, and the bishop had two candles burning before him.

"So you have left the gude cause," said his visitor.

"I have got new light, Janet," said his lordship.

"Maybe," returned Janet; "for when you were in Perth you were content wi' ae caunel, and noo ye burn twa!—And that's yer new licht."

SPEAKING of parsons, a story is told of one who is "favored" with absent-mindedness and a short memory. He has a habit of forgetting something he intends to say in the pulpit, and then, after sitting down, will rise up again and begin his supplementary remarks with "By-the-way." Recently he got through a prayer, when he hesitated, forgot what he was about, and sat down abruptly without closing. In a moment or two he rose, and pointing his forefinger at the amazed congregation, he said, "Oh! by-the-way—Amen!"

A GENTLEMAN eminent in the engineering and mechanical world, while enjoying his summer vacation in the interior of Pennsylvania, found in the grave-yard at Milford a stone on which was cut the following:

Here lies the Body of
JOHN BRECK,

Who departed this life April 9, 1809, aged 18 years.

Come, all ye mourners, to the tomb;
See here a youth cut off in bloom;
Although he's hurried to his last,
We hope the Lord hath found him rest.

This be a warning to ye all—
Should at your house a sick youth call,
It's not a secret for to keep,
But let the parents *know* of it.

HARPER'S NEW MONTHLY MAGAZINE.

No. CCLXI.—FEBRUARY, 1872.—VOL. XLIV.

THE SCOTT CENTENARY AT EDINBURGH.

EDINBURGH CASTLE AND THE SCOTT MONUMENT.

IT is now about ninety-two years since a poet, visiting at the house of a friend in Edinburgh, was attracted by some lines attached to a picture of a soldier dying in the snow. "Who," he asked, "can be the author of these lines?" There were old and some learned persons present, but they could not answer. A boy in the room, some eight years of age, said, "They are by Langhorne, Sir." The poet fixed his large, bright eyes upon the lad, and, moving to him, said, "It is no common course of reading that has taught you this." Turning to the company, he said, "This lad will be heard of yet."

The poet was Robert Burns; the lad was Walter Scott.

So slight yet so significant was the contact of the two most famous Scotch think-

ers—the two most different of all those thinkers who have made a little belt of Scotland more remarkable for the men of genius reared on it than any other land of equal extent save ancient Greece—as they passed each other on the highway. It is memorable now as we reach a memorial year in the history of that lad whose career Burns prophesied. On the first day of August one remembered it, looking from the little monument of the earlier poet upon that matchless monument in the distance, whereon the workmen are as busy washing and scraping away any dust that may have gathered upon the marble figure seated beneath its Gothic canopy, as we who look on are to restore the ideal image of the man to life, freeing it from any unreal colors which admirer or critic might have cast upon it since the pen

Entered according to Act of Congress, in the year 1872, by Harper and Brothers, in the Office of the Librarian of Congress, at Washington.

VOL. XLIV.—No. 261.—21

fell from his hand, and the rounded work was bequeathed to the judgment of mankind.

The poor statue looks somewhat embarrassed under the eyes of the crowd perpetually gathered to observe the cleaning of him. A wonderful monument it is! Not less the memorial of the great author than of the unhappy architect whose life and exquisite genius it represents. There is something sadly romantic in the story of this architect, the finest Scotland ever produced. On one occasion, when Sir Walter was driving in his carriage near Peebles, he passed a poor and ill-dressed youth toiling on foot amidst the heat and dust. After the carriage had dashed past, the coachman was ordered to halt, and Sir Walter called to the youth and asked him where he was going. It happened to be to the same place to which the baronet was bound, and the young man was invited to occupy a seat. By this kindly act Scott was, for a little while in his life, brought in contact with Kemp, then a traveling joiner, who afterward became an architect, and, in competition with others, had his plan for this monument accepted. But after the incident with Scott, Kemp traveled through England, and studied every cathedral in it. He then passed over into France, and there studied every ancient church. He became the most consummate master of the Gothic style in all its details. While he was thus possessing himself of the secret of his future art he supported himself by common work, as any journeyman would. It was soon after his return from France that designs for the Scott Monument were invited; that which Kemp presented was a beautiful pyramidal pile of Gothic turrets covering a seated statue of the poet, each moulding, foliation, and ornament to be taken from Melrose Abbey. The committee who accepted this design found Kemp living in great poverty with his small family. Just as his great work was nearing completion his dead body was found in the water, the result, it is believed, of an accident. Public honors were paid to his memory at the funeral, and then he was forgotten. But on the occasion of the Centenary, when visitors from near and far were gathering around the beautiful structure, Dean Ramsay discovered that poor Kemp's widow and four children had been since his death struggling along on a pittance of twenty pounds a year, with what the woman could add by needlework. There has been an honest shame at this, and one of the best results of the Centenary has been a subscription which will render the remnant of Mrs. Kemp's life comfortable, and enable her to educate her children.

At a little distance from the monument stands the noble edifice of the Royal Scottish Academy, in which was to be seen, during the months of July and August, the "Loan Exhibition in Commemoration of Sir

Walter Scott." The Queen consented to be the special patroness of this exhibition, and sent to it various interesting pictures. There were in the exhibition four hundred and ninety-six objects, all of which bore some relation to Scott or to his personal friends. There were here spread out volume after volume of the poet's manuscripts, those of his novels and poems being nearly all carefully preserved. He wrote in large blank books, well bound, and with a small but neat and clear chirography, so that each page may be read, with all those minute directions to the printer, even concerning the dashes, which were so characteristic. I never realized what a tremendous worker Scott was until I beheld this array of manuscript books. There were numberless manuscripts of incidental interest. One was the contract of marriage between "Mr. Walter Scott, Writer to the Signet, eldest lawfull son of Mr. Robert Scott, in Sandieknow, and Mrs. Anne Rutherford, eldest daughter of Dr. John Rutherford, Professor of Medicine in the Colledge of Edinburgh, and the deceast Mrs. Jean Swinton, his first spouse, daughter of the deceast Sir John Swinton, of that Ilk," etc. There is the manuscript of a letter written by Mrs. A. Cockburn to the Rev. Dr. Douglas, giving an account of Scott when a child. "I last night supped," she wrote, "in Mr. Walter Scott's. He has the most extraordinary genius of a boy I ever saw. He was reading a poem to his mother when I went in. I made him read on. It was the description of a shipwreck. His passion rose with the storm. He lifted his hands and eyes. 'There's the mast gone!' says he; 'crash it goes! they will all perish!' After his agitation he turns to me. 'That is too melancholy,' says he; 'I had better read you something more amusing.' When taken to bed last night he told his aunt he liked that lady. 'What lady?' says she. 'Why, Mrs. Cockburn; for I think she is a virtuoso, like myself.' 'Dear Walter,' says Aunt Jenny, 'what is a virtuoso?' 'Don't ye know? Why, it's one who wishes and will know every thing.' Now, Sir, you will think this a very silly story. Pray what age do you suppose this boy to be? Name it now, before I tell you. 'Why, twelve or fourteen.' No such thing; he is not quite six years old. He has a lame leg, for which he was a year at Bath, and has acquired the perfect English accent, which he has not lost since he came; and he reads like a Garrick. You will allow this an uncommon exotic." There is a small portrait of the sensible and amiable face of the writer of this earliest mention of Scott's genius, and also a miniature of the boy who made such an impression upon her. This miniature, which belongs to James Young, Esq., represents a boy who had certainly made an impression upon the artist who painted it. There is the greatest care

taken in giving the strong, full brows, the already noticeable towering of the forehead, and the full, pulpy, voluptuous lips. I have never before seen a case in which the face of the six-yearling so closely resembled that of the sixty-yearling. There is, perhaps, more gravity about the face of the child. As a boy Walter Scott was not beautiful; but the face is remarkable, and has a look of reserve.

To return to the manuscripts: one of the most interesting was the original of "Rob Roy." It was presented to Mr. Constable by the author in 1822. In 1831 it was sold by Mr. Constable's trustees, and purchased by the famous John Wilkes, M.P. It was resold in 1847, and purchased by Mr. Cadell, of Edinburgh, presented by him to Lockhart, and at last found its way into the possession of Mr. Hope-Scott, its present owner. In this beautiful and complete manuscript volume is inserted the following note by Scott to Ballantyne, his publisher:

"DEAR JAMES,—

"With great joy
I send you Roy.
'Twas a tough job,
But we're done wi' Rob."

Here, too, is the original manuscript of Scott's translation of the Morlachian ballad of the wife of Asan-Aga. It is entitled "The Lamentation of the Faithful Wife of Asan-Aga, from the Morlachian Language." This version is a translation from Goethe's version—"Klagegesang von der edlen Frau des Asan-Aga"—beginning,

"Was ist Weisses dort am grünen Walde?
Ist es Schnee wohl, oder sind es Schwäne?"

This version begins:

"What yonder glimmers so white on the mountain,
Glimmers so white where yon sycamores grow?
Is it wild swans around Vaga's fair fountain?
Or is it a wreath of the wintry snow?"

There are twenty-seven stanzas, and they were written about 1798. The Morlachian ballad was first published by Herder in his "Volkshieder," and a literal version appeared in the late Professor Aytoun's "Doleful Lay of the Wife of Asan-Aga." Why Scott's version has not been published is a mystery; it is very spirited and characteristic.

Besides a careful pedigree of the Scott family made by Sir Walter himself, we have occasionally some illustrations of what kind of fruit grew upon that tree. For example, there has been transferred for this occasion from the Abbotsford Library an old book with this title: "A true History of several Honourable Families of the Right Honourable name of Scot, in the Shires of Roxburgh and Selkirk, and others adjacent. Gathered out of Ancient Chronicles, Histories, and Traditions of our Fathers. By

"Capt. Walter Scot,
An old Souldier, and no Scholler,
And one that can write nane
But just the letters of his Name."

This book was printed in 1688, and in it Sir Walter has written, opposite the title-page, the following lines:

"I, Walter Scott, of Abbotsford, a poor scholar, no soldier, but a soldier's lover,
In the stile of my namesake and kinsman do hereby discover
That I have written the twenty-four letters twenty-four million times over;
And to every true-born Scott I do wish as many golden pieces
As ever were hairs in Jason's and Medea's golden fleeces."

It is a notable fact that although the Scott family was so old, and always considered a "talented" family, it never seems to have produced any very distinguished individual except the one who has made the name famous, though Sir Walter always believed that a brother of his, had he lived, would have been superior to himself. Mr. Carlyle has made it a sort of proverb that "great men are not born from fools;" and Mr. Francis Galton has shown that talent runs in families; but the facts attesting this also prove that consummate genius—as in the case of Burns, Shakspeare, Napoleon, Dante, and Goethe—generally exhausts and ends the family gift. Goethe, whose eagle eye few things of this kind escaped, in speaking of Voltaire and Louis XIV. in "Rameau's Neffe," has a foot-note, in which he observes that it seems a law that when a nation or a family is about reaching the end of its destiny, some great man comes forward to embody and fulfill it. Like a hidden vein of water, it springs through him, fountain-like, into the air, and is redistributed to the elements.

An interesting object in the collection was Meg Dod's punch-bowl, once cracked by Sir Walter, and now a valued relic owned by Mr. Walker, of Peebles. It will be remembered that when Sir Walter accidentally broke the bowl—a handsome one for those days—he was so afraid to meet the said landlady that he crept stealthily out of the house, taking the cracked bowl with him, and rode away to town. There he found a skillful workman who repaired the bowl very neatly, and then he returned with it. Meg scolded him sharply, indeed, not on account of the breakage, but for leaving a respectable house in such an unseemly way, and in the night, all on account of "a bit o' crockery." There are two walking-sticks, one that was habitually used by Sir Walter, who gave it to William Laidlaw, his gamekeeper, by whom it was presented to Dr. Charles Mackay; the other, a curiously crooked one of thorn, cut by the baronet at Abbotsford in 1830, and by him presented to John Leycester Adolphus, author of "Letters on the Authorship of Waverley." Near these is the great man's pipe, its stem a foot long, and its wooden bowl a carved head of some huge king with a crown on it. Sir

Walter's gold watch and chain; his pencil-case; the basket which held his baby-clothes (cherished by Miss Aytoun); the dress in which he received George IV. (a plaid coat, scarlet waistcoat with twenty large glass buttons, and no trowsers—for reasons which will occur to all who are familiar with the Highland costume); his snuff-boxes; his piper's bagpipe: these and various other relics were on view, and were generally surrounded by larger companies than were attracted by the case where the original manuscripts of his chief works were exposed to view. I have observed all through Europe that the crowd is generally more attracted by some little thing related to the every-day personality of a famous man than by the more imposing monuments of his greatness. At Berlin it is Frederick the Great's clothes, at St. Petersburg Peter the Great's hat and boots, and every where it is the Virgin Mary's hair or smock, or some saint's toe-nails, which excite the most eager interest. Relic-worship is so deep in man that it is a wonder no philosopher has distinguished him from all other animals as possessing this proclivity. But why should it assume the form of preferring a man's pipes to his poems? At Stratford one or two common clay pipes found on the site of the house which Shakspeare built certainly excite more attention than the early folios. Is this a survival of the Roman Catholic adoration of holy relics, which have generally to be made small, and representing once unimportant objects, so as to avoid criticism or skepticism? A peasant who will believe in a bit of bone from St. Peter's finger would begin to doubt if St. Peter's fishing-boat and tackle were presented.

Few things in the exhibition interested me so much as one or two objects connected with the authoress of "Auld Robin Gray," Anne Lindsay, the life and soul of a memorable social and literary circle. Here are three volumes associated with this gifted woman. "Lays of the Lindsays: being Poems by the Ladies of the House of Balcarras." This volume—a quarto of 123 pages—was designed by Sir Walter Scott as a contribution to the members of the Bannatyne Club, but after being printed it was suppressed. By its side there is a letter written by Sir Walter to the secretary of the club, in which he says:

"The Lays of the Lindsays *have been recalled and canceled*, Lady Hardwicke having taken fright at the idea of appearing in a printed though unpublished shape. We are, however, to have Auld Robin by himself, and I wish you would speak to Mr. Lizars about engraving on my account the inclosed frontispiece, drawn by Mr. Kirkpatrick Sharpe, and let me know the damage when you write again.

"I am, dear Mr. David, yours assuredly,
"WALTER SCOTT."

The letter is dated at Abbotsford, October 3—probably of the year 1824, for in the

following year appeared the second of these relics: "Auld Robin Gray: a Ballad. By the Right Honourable Lady Anne Barnard, born Lady Anne Lindsay, of Balcarras." (She was the eldest daughter of Alexander, sixth Earl of Balcarras, and in 1793 married Andrew, son of Thomas Barnard, Bishop of Limerick. She died in London, 1825.) The third relic of this lady is the manuscript and continuation of "Auld Robin Gray"—the autograph of the authoress—with an original letter to Miss Cummyng, signed with her maiden name. This was written from Broomhall, and about the year 1770. The exhibition is particularly rich in pictures and objects associated with that general intellectual life of Scotland which, in the past, as even at this day, manifests itself in snatches, so to speak. It may be safely assumed that if the genius which flowered into "Auld Robin Gray" had fallen on English soil we should have had whole parterres of it; and not less may be said of the genius which animated the lovely Miss Rutherford (afterward Mrs. Alicia Cockburn)—shown here in a beautiful miniature—whose exquisite song, "Flowers of the Forest," moistens half the eyes in Scotland every evening of the year. Aubrey de Vere says all the works of great genius have been occasional; it is certain that many, if not most, of the finest products of Scottish genius have come quite unprofessionally, wild flowers springing up in unnoticed spots, unbidden by publishers, fed by the inspiration of the hour.

There are no fewer than one hundred and twenty-nine portraits of Sir Walter Scott! I suppose that there never was another literary man who had so many portraits taken of him. Of these pictures thirty-five are paintings, the rest being engravings, some of which are copies of the painted portraits. The famous man was painted at his breakfast, in his garden, in his study, among his family, among his literary friends, among his servants, and at nearly every period of his life from six to sixty. Watson, Northcote, Sir F. Grant, Sir W. Allan, Sir E. Landseer, Calvin Smith, Wilkie, Sir Henry Raeburn, Sir Thomas Lawrence, Sir Watson Gordon, Gilbert Newton, Andrew Geddes, Graham Gilbert, Gourley Steel, Thomas Philips, Henry Pickersgill, James Hall, Robert Scott Lauder, W. Nicholson, C. Leslie, John Ballantyne, Gatti, Pasto e Marte, Knight, and Vasalli, all have aided in transmitting the Wizard of the North to posterity pictorially; while Chauntrey, John Greenshields, and other sculptors have conveyed to us his form and moving. The variations in the representations of the man, when we consider the vast number of the portraits, are singularly few; but where they do occur they are remarkable. It is plain there were two Sir Walters, according to the eye that looked upon him. Some have painted the

courtly baron in fine raiment, surrounded by luxury and grandeur; others have given us the rough Scotch countryman, with all his stumpiness of form and rude strength of feature. Sir W. W. Knighton has sent here a large painting of "Sir Walter Scott sitting to J. Northcote, R.A.," and the made-up, constrained attitude of the poet is really ludicrous. He is attitudinizing painfully as Sir W. Allan painted him in "The Study at Abbotsford," where he seems to be saying to himself, "If this fellow isn't off soon I shall certainly change this posture for one that he would not select." Sir E. Landseer has painted the bard's dogs admirably, but the bard is not Sir Walter: it is an idealized nobleman for London society to go into raptures over. Of this pretentious class of portraits is also that of Sir John Watson Gordon, who has represented him writing in his study in Castle Street, Edinburgh, after the fashion in which the Scotch Tories would like to think of their fellow-Tory who had cast much needed lustre upon the aristocratic order. Philips makes him Byronic in look and dress. Beginning with the portrait (doubtful) of his mother, a fine-looking, firm-nosed old lady, we can trace out the real features of her son here where David Wilkie makes him look like an old woman, and Andrew Geddes or Calvin Smith show the rugged "power," the precipitous forehead, the heavy under-face, all lit up by the fire that may break out as flame or sunbeam. Several of these portrait pictures must be looked at attentively to be appreciated. Of this kind is that of the Abbotsford family, painted for Sir Adam Ferguson in 1817 by Sir David Wilkie. Sir Walter and Lockhart are dressed like farmer and field hands, and the ladies are barefooted and bare-necked dairy-maids or washer-women. The characters do not disagree with them much, and though the ladies are pretty, their beauty is rustic. Anne Scott (Mrs. Lockhart), particularly, had that element in her look, and probably in her disposition also, for in the drawing-room at Abbotsford there is another picture representing her as a barefoot peasant with a basket on her arm. "The Author of Waverley in his Study," painted for R. Nasmyth, Esq., by Sir W. Allan (1831), is also a wonder in its way. It was the last for which the author sat. Sir Walter is represented in his study at Abbotsford, surrounded by all those curiosities and relics which he prized so highly. He is reading Queen Mary's proclamation previous to her marriage with Darnley. At his feet, on the rug, is his favorite stag-hound, Maida. The still-life of the picture is all from Abbotsford, where the objects represented are still shown to the visitor. The vase which Byron presented him, the keys of the old Tolbooth at Edinburgh (Heart of Mid-Lothian), the sword of Montrose, the rifle of the Tyrolese patriot

Speckbacher, the ancient Border bugle, the brandy-flask of James VI., Rob Roy's sporran (purse) and long gun, Claverhouse's pistol, Napoleon's brace of pistols, and many similar things, environ the Border Minstrel as his natural frame. This picture has been engraved by John Burnet, but the engraving gives little idea of the rich, impressive depth of feeling it contains. It belongs to the National Portrait Gallery of London—that very valuable though small collection which no wandering American ever thinks it worth his while to visit. Only second to this in interest is Gourley Steel's "Scene at Abbotsford during the last days of Sir Walter Scott." The old man is bolstered up in his chair, and is feebly and sadly caressing his favorite dogs. The gamekeeper who has brought them in hangs his head in sorrow; a female servant hides her emotion behind a screen at one corner of the room. The old baronet feels that he is bidding his humble comrades a final farewell; but there is no weakness in his look, nor sentimentality in the artist's rendering. Here, too, is a portrait painted in 1820 by John Watson Gordon, now owned by the present Lord Napier, for whose ancestor—the late Marchioness of Abercorn—it was painted. Here are two letters, hitherto unpublished, addressed to Lady Abercorn by Sir Walter, in relation to this beautiful picture:

"EDINBURGH, 1st July, 1820.

"The portrait is advancing, by the pencil of a clever artist, and will, I think, be a likeness, and a tolerably good picture. I hope to get it sent up before I leave town; at any rate, I will have it finished so far as sittings are concerned. If I look a little sleepy, your kindness must excuse it, as I had to make my attendance on the man of colors betwixt six and seven in the morning."

"ABBOTSFORD, 2d August, 1820.

"The dog which I am represented as holding in my arms is a Highland terrier from Kintail, of a breed very sensible, very faithful, and very ill-natured. It sometimes tires, or pretends to do so, when I am on horseback, and whines to be taken up, where it sits before me like a child without any assistance. I have a very large wolf-greyhound, I think the finest dog I ever saw, but he has sat to so many artists that whenever he sees brushes and a palette he gets up and leaves the room, being sufficiently tired of the constraint."

One of the most charming pictures I ever saw is "Sir Walter Scott and his Friends at Abbotsford," by Faed. The author is represented in the height of his personal and intellectual vigor reading a manuscript to his literary friends. The persons present are James Hogg, Henry Mackenzie, John Wilson, George Crabbe, Lockhart, Wordsworth, Jeffrey, Sir Adam Ferguson, Moore, Campbell, Sir W. Allan, Sir D. Wilkie, Constable, Ballantyne, Sir Humphrey Davy, and Thomas Thompson. Not only are all these portraits, but each has a characteristic attitude and expression. Never was there a picture which more completely conveys the meditative genius of Wordsworth than that which one finds in this vast work; and the Ettrick

SIR WALTER SCOTT.—[FROM THE MASK TAKEN AFTER DEATH.]

Shepherd, kilted, and nervously biting the curved end of his cane, gives a most vivid impression of the man who, while he loved to sit at Sir Walter's feet, always felt restless when in the presence of his fashionable friends.

But all the portraits of Scott find their best foot-light in the mask of his face and head, taken after death, and now owned by Mr. Hope-Scott, of Abbotsford—the first engraving of which ever permitted to be made I am happy in being able to place before the readers of this Magazine. Nothing else that I have seen shows so well the tower-like elevation of the head, or the strange jutting of the brow over the deep-sunk root of the nose. It is to Mr. W. F. Watson, of Edinburgh, that the reader is indebted for the privilege of seeing this mask; and in making this acknowledgment I take occasion to remark that, great as were the treasures and reliques of the Loan Exhibition, the collection there seen was of less interest than that which has been made by the gentleman to whom I have referred. Mr. Watson, with a high literary enthusiasm, a highly cultivated taste both for letters and art, and with, happily, ample fortune, has surrounded himself with paintings, manuscripts, letters, books, and multifarious reliques, not of Sir Walter Scott alone, but of all the great men of Scotland. These things, each a treasure, he possesses to the extent, literally, of thousands. In his house one moves from room to room, every wall of room or hall being completely covered over with pictorial memorabilia of Scotland by the great masters, while the tables, the cases, the very chairs, are stocked with objects of beauty gathered from the homes and studies of the great fraternity of Scottish thinkers. Never, until visiting the abode of this accomplished gentleman, had I realized how deep is that sentiment in all of us which reverences all that reflects, however slightly, the *personnel* of a great man—the

BRONZE CAST OF THE HEAD OF SIR WALTER SCOTT AFTER DEATH.—[FROM A PHOTOGRAPH.]

lower form of which is the relic-worship of the superstitious, the highest that hero-worship to which the greatest living Scotchman has called us. It is, after all, much to read from the page on which the eye of Burns once rested, to gaze on the face whose lineaments were dear to him, to read the casual letters, to observe the sweet miniatures of friends around which once hovered the fancies and the delights of those whose work has made our life more deep and rich. Mr. Watson has not only original portraits of the great Scotsmen, but of their friends, their sweethearts, and originals of their characters—those whose names alone are known to the world. It is his hope, as it is that of all who know any thing of his quite indescribable treasures, that he may be able some day to lay before the world a descriptive volume with careful illustrations of them. If that hope be realized, the world will not get a mere catalogue of curiosities, but have the means of forming new conceptions of the lives and associations of some of the most interesting characters in literary history.

The 9th of August, the day fixed upon for the Centenary festival at Edinburgh, was a beautiful day. I walked out in the early part of the day to see the decorations of the city. These were very few. Prince's Street, the glory of Edinburgh, which runs along the verge of the gardens which lie near the Castle, surround the Scott Monument, and terminate in a horribly dingy square devoted to the ugliest railway station that ever deformed the heart of a beautiful city, had some floral festoons that were really beautiful. Sir Walter Scott, sitting under the Gothic canopy of his monument, was elegantly adorned with flowers, and held a fine wreath around his hand. But there the efforts of the city seemed to terminate, and save for a dozen straggling flags, about two to a street, one could find no evidence of any outlay upon the celebration. The day's joy was best reflected in the delight of the crowds streaming along the streets at get-

ting an unusual holiday. The most conspicuous celebration was furnished by a circus company, which paraded the streets, and which, though their procession was deplored by the chief citizens, gave the populace a great deal of amusement. We had an Ivanhoe in armor that fitted him ill, a Queen Elizabeth highly rouged, and sundry characters from the Waverley novels which were exceedingly droll. The spot near the University where Scott is said to have been born was adorned with a bower of green boughs, surmounted by a kind of May-pole with a streamer at the top. Several public-houses had daubs of the poet's creations in their windows, the favorites being a brick-dust hag in a boat, whom inscriptions enabled us to identify as the Lady of the Lake, and Ellen Macgregor, with her foot upon her native heath.

This reference to the native heath reminds me to say that, after the Loan Exhibition, the most creditable thing I witnessed at Edinburgh in connection with the Centenary was the performance of "Rob Roy" at the theatre. The actors were, with two or three exceptions, very good, and rendering the dialogue, as they did, in pure Scotch, one had perhaps little reason to envy his Majesty George IV. his enjoyment of the same play at the same theatre, as the play-bill of that evening preserved in the exhibition certifies. On one evening the performance was turned into a kind of celebration, when a prologue written by Lord Neaves was recited. Lord Neaves is rather a busy little nobleman with complimentary work of this kind, and he is not always felicitous. His poem on this occasion was what Thackeray would call "emusing." But Lord Jervis-woode, and the Lord Justice-General, and other distinguished personages present declared it capital, and I must not withhold it from transatlantic readers:

"This very month one hundred years ago,
In our own town—the site we still can show—
A babe, new-born, its life-long task began,
To look on nature and to study Man.
No seer or wizard saw, by second-sight,
How full that boy would be of life and light;
No stray Guy Mannering traced with prescient gaze
The horoscope that showed his future days;
And none would have believed a prophet's words
Foretelling what this festival records.

"Nor even, while first he ran his young career,
Did sure prognostics of his fame appear.
The plant put forth no rash precocious flowers,
But seemed to bide its time and nurse its powers.
Yet soon the sense of noble tastes began:
The heedful Child was father of the Man.
On every side he found what swelled his store
Of Scottish story and of ballad lore.
Wood, Water, Wilderness, rejoiced his soul,
And old Tradition fixed her firm control.

"Full well in him such influence could inspire
The patriot's zeal, the poet's fervent fire:
Could bid him strike the harp with fearless hand
In honor of his own, his native land;
On Britain's brow new garlands to bestow,
And rival all but Shakspeare's name below.

"To you, assembled here, I need not tell
The varied strains he sang, and sang so well.
Never with Nature, Faith, or Hope at strife;
Replete with action, energy, and life,
His flowing numbers opened up the past,
Gave men and things the forms that long will last,
And lent to lake and mountain, sea and shore,
Unnumbered charms not seen or felt before.

"Then came a pause; but when he ceased to sing
A Great Unknown stepped forth, with Gyges' ring
His magic power all hearts and minds subdued:
The sun had set, but Night had not ensued.
No aid from verse this new Enchanter sought,
But yet his wand poetic wonders wrought.
Each form of many-colored life he drew,
To nature ever, and to Scotland, true;
Nor did he leave (let this be ne'er forgot)
'One line which, dying, he could wish to blot.'

"Rumor was rife; conjecture seldom slept;
But sure no secret e'er was better kept,
Till on that night, which Actors love to name,
Scott and the Great Unknown were found the same.

"And here, I'll say, that we, perhaps the most
Of all he favored, may his kindness boast.
Prompt to uphold the rightful Drama's part,
He prized the Artists, while he loved the Art.
Kemble, Young, Terry, to his heart were dear;
Mathews and Murray found his warmth sincere.
Therefore, to-night, to aid the general joy,
We bring our grateful tribute—in 'Rob Roy.'
Its parts, alas! can now be filled no more
By those who gave them such success of yore;
And some, I see, as round my eyes I cast,
Will loudly speak in praises of the past.
The Bailie's oldest friends will heave a sigh;
But crowds are here who never saw Mackay;
Who knew not Duff, that matchless Dugald Crater,
So true to human—or to Highland—nature.
We'll do our best; and what they now behold
I trust the young will praise—when they grow old.

"So now farewell! though neither You nor We
The next Centenary will likely see,
'Tis something to have swelled the loud acclaim
That pays due homage to so great a name.
For his sake, then, to this our Mimic Scene
Be as indulgent as he would have been."

If my reader has been impressed by Burns's first recognition of Scott when eight years old, and with Mrs. Cockburn's letter, quoted above, describing the wonderful traits of Scott when a child, he will be no doubt surprised that Lord Neaves should have occupied the first fourteen lines in disparaging the early promise of the bard; and I need not give a hint to the enthusiasts for Burns, Byron, and other magnates concerning the line which places the Abbotsford poet next to Shakspeare. The detective critic, when he reads,

"Each form of many-colored life he drew,"

will instinctively add,

"Created worlds and then imagined new."

However, I have known worse prologues than this of Lord Neaves, and the audience seemed to have never heard a better. But I wish I could paint for those who shall peruse these words the radiant faces of the Olympian deities in the gallery, who hold the fates of plays in the palms of their hands, when the battle was going on between the men of Rob Roy and the English

troop sent to seize him, or when the "honest rogue's" valiant spouse cries, "My foot is on its native heath!" I have sometimes thought, when in other parts of Scotland than cultivated and charming Edinburgh, that if the Scotchman be scratched, the Rob Roy element in him will appear. The enthusiasm of the small boys at the theatre for that hero-highwayman made me suspect that the same element appears even there in an embryonic way. And my experience of the Centenary banquet compelled me to the conclusion that some confusion as to the fundamental compact of society survives in a certain class of mature minds even in that centre of refinement and culture.

"You Scotch are always *canny*, you know!" said an American to a true Scotch gentleman. The gentleman addressed colored up, but, seeing that the American did not mean to offend, he answered by saying, "As I presume you were at the Scott banquet last night, it is a bad time for me to defend us from the charge." The American was completely bewildered by this reply. He had evidently mistaken the sense of the word "*canny*," and I ventured softly to hint to him that it meant *stingy*. Whereupon he apologized to the Scotch gentleman, declaring that by *canny* he had meant shrewd, but by no means stingy. The reference of the Scotchman to the Scott "banquet," as it was, I must say, cannily called, reminds me that in referring to the festival I am touching a thing the disgracefulness of which those who have given to Edinburgh the repute for hospitality which it really merits felt more bitterly than the outraged guests from abroad. Possibly, the intelligent and refined citizens to whom I refer were not altogether without fault. They ought never to have permitted a set of ignorant and obtrusive men to get possession of the entire arrangements for celebrating the Centenary of Sir Walter Scott. But the traditional fashion which takes the majority of respectable people to the Highlands or sea-side on the first really summer day is very strong, and such were only too glad to leave the preparations for the festival of August 9 to a set of (for the most part) vulgarians. Indeed, the fact that the 9th was selected instead of the 15th of the month—the real birthday—showed a sad degree of indifference among the upper classes, for the alteration was made in view of the recognized impossibility of getting eminent personages to lay aside their guns, after the moors were lawfully opened for sport, on account of any literary occasion whatever. Thus it happened that, after paying each a pound for admission to the "banquet"—a sum which is the ordinary price for a public dinner of over a dozen courses, including Champagne—we were all stuffed into a low-roofed hall, the arrangements of which seemed to have been made with an eye single to

cheapness. Amidst a sea of rubbish, daubed rags claiming to be considered flags, and the like, the persistently exploring eye could now and then catch something that was interesting. A gigantic figure of Sir Walter Scott had been specially and spiritedly painted by the artist Herdman, and contributed to the occasion; and there was the Scott coat of arms—a moor, a mermaid, a woman holding the sun in one hand and a crescent moon in the other, the motto being "Watch Weel"—a painting which was the first work of the now famous Thomas Faed. A Scotchman had sent from the far West of America a noble elk-head, between whose horns were the words, "Triumphant be the Thistle;" and there was an old armorial trophy made of ancient weapons like those with which Sir Walter Scott loved to surround himself. A few good bronzes of Scott's characters were visible also amidst the general ugliness.

Those present sat on a bare and narrow plank, and ate and drank (such as had courage so to do) from another bare and narrow plank raised before them. For each dozen guests there was a dish containing two hard, green apples, several sour plums, a bunch of grapes, and (for every three dozen) a pine-apple. For every dozen persons there were two decanters of fluids called by the official and the humorous "wine," one containing an acrid juice labeled "claret," which suggested the possible taste of logwood and vinegar, the other being a "sherry" whose genuine Hamburg origin I should never have suspected had not the individual who furnished it instituted legal proceedings against a Glasgow paper for publishing a similar opinion. And this was all that two thousand people were given in exchange for two thousand pounds! At first the curses of the hungry crowd were deep; then they began to calculate the amount which the *canny* committee would make—the amount expended by them for each guest being variously estimated at sixpence and at eightpence. Finally they became merry. No lady could stir without shattering a wine-glass, evoking a glad exclamation, "Another sixpence out of them!" When the Lord Mayor of London, toasting Edinburgh, remarked that it had given England the founder of its Bank, some one said pretty loudly that the committee might find another bank on the proceeds of the banquet. Few were daring enough to drink the "wine;" some who tasted it suddenly put their handkerchiefs to their mouths thereafter; but the waiters were not so cautious, and many of them soon became sadly demoralized. One of the chief waiters at the table where I was seated was so influenced that I saw him seated in a large pannier of wine-glasses, with his legs and arms sticking out, two other waiters, who were vainly attempting to pull him out, being in a fair way to end in reclining upon

MEDALLION DESIGNED BY SIR NOEL PATON.

him. One of the leading committee-men—whose presence reminded me that even against those officials the charge of meanness must not be made indiscriminately—was not only a good fellow, but an ardent teetotaler. When I observed that perhaps the committee generally were teetotalers, and that the bad wine was cunningly provided to induce us all to take the temperance pledge, a gentleman near me said, “At any rate, *that* man could have known nothing about the wine, for he will never taste liquor; he has been in a beastly state of sobriety for twenty years!”

Before the speaking began another trouble arose. Having no good place to deposit hats, canes, and umbrellas, the guests who sat on the “platform,” temporarily raised around the main room of the Corn Exchange, placed the said articles under their seats. What was their dismay on finding that beneath these seats there had been vacancy only, and that every article so deposited had fallen down several yards into dark and dirty stalls. There was a general outcry, and after

a good deal of trouble the waiters went beneath to find them. To the consternation of many, they returned reporting that the articles could not be found. Others comforted us by reporting that they were all stolen; and I fear that many of them were, though the one lost article in which the writer hereof was interested followed him to London about two weeks later. But mark the economy which did not even put flooring beneath the seats!

I omitted to state that one other thing given us for our money was a paper medallion, which, though designed by Sir Noel Paton, I venture to say was the very worst thing of the kind ever drawn. On a pedestal that seems to be flat and oblong there is set, unevenly, a bust of Sir Walter Scott, who is casting sheep’s-eyes in a most unseemly manner at two damsels. One of these damsels is panoplied, and her face expresses the utmost astonishment at the height to which she has to reach in order to crown the bard; while the other, an angel, whose wings both come out of the left shoulder, looks upon

us with some dismay as (with a hand sadly disfigured by some accident) she points to the word "SCOTT"—a word not unnecessarily placed beneath the bard's face. At the bottom are the lines of Burns:

"Time but th' impression stronger makes,
As streams their channels deeper wear;"

and at the top is a sentence which one at first thought was meant for Latin, but which must have been intended as a puzzle for the amusement of the company. Most of us gave it up. The sentence is, "Bardorum Citharas Patrio qui reddidit istro."

The speaking was, on the whole, fortunately, better than the miserable frame-work which surrounded us. Sir William Stirling Maxwell, from whom much was expected, did indeed make little less than a failure, so far as his delivery was concerned. Not only did he hesitate, falter, and every now and then stop altogether, but, when speaking, he was inaudible to five-sixths of those present. In what he said, also, he was at times infelicitous, as, for instance, when (being himself a high Tory) he undertook to give credit to Scott for those miserable Tory pamphlets whose every sentiment time has shown to be short-sighted and false, and which Scott's friends regarded, when they appeared, as signs of a failing intellect, and his wisest admirers now never mention. For the rest, Maxwell's speech was commonplace. But the same can not be said of the speech which followed, that of the Lord Justice-Clerk (Moncrieff), who, with a clear, fine voice and simple manner, made a very witty and telling address, in response to the toast of "Our National Literature." The best thing he said was a rejoinder to Sydney Smith's famous saying (which the Scotch can never forgive), that "it requires a surgical operation to get a joke into a Scotchman's head." To this the speaker said: "Sir Malachi Malagrowther, if he had been alive, would probably have rejoined that it is only English jokes which require the scalpel to introduce them." This retort is so obvious that it is a slight reflection on the Scotch that it was never made before. In speaking of the expressiveness of Scotch phrases, the speaker well remarked that their dialect contained some rich words that had been lost out of English. "My own feeling," he said, "of the

'Blythe, blythe and merry was she,
Blythe and merry but and ben,"

scarcely admits of an English rendering that suggests to the Scotch ear all that is winsome in domestic life. 'Tryst' has a sweeter sound than a 'rendezvous,' and to 'dree a weird,' although it does not sound so fine, is perhaps as expressive as Campbell's sentiment—

"To bear is to conquer our fate."

The speaker alluded in splendid terms to Burns, and for the first time during the evening the whole meeting broke out with real and hearty cheering. Dean Stanley had come primed with a speech which he had to throw aside. Moncrieff had taken it so completely out of his mouth (as I afterward learned on good authority) that much credit is due the dean's self-restraint (unless it be due to the absence of knives and forks) that he did not run something sharp into his lordship, by whose side he sat. But it is probable that the dean's prepared speech was not so good as the one he really did make. This was certainly a very good one, and well delivered. True, a good many present winced at the one piece of discriminating criticism on Scott which was heard during the whole evening: "I might grant," he said, "that there are hundreds of mistakes in detail, hundreds of confusions of chronology, topography, and the like. The British Association would almost go mad at the fact that this great genius has made the sun to set in the German Ocean. The Palestine Exploration Fund would have its hair set on end at the dreadful confusion of sacred topography in the Tales of the Crusades. A Scandinavian scholar, a friend of mine, can never forgive the author of 'Ivanhoe' for having confounded the Scandinavian god Zernebok with some Saxon goddess. But in spite of all these mistakes in detail, it remains certain that in the novels of Walter Scott we have an insight given us into the history of former times more true than any historian had formerly given us. Not even from Philip de Comines do we know Louis XI. so well as from 'Quentin Durward,' and he has made us more intimate with James I. than with any sovereign now living." After a graceful and hearty speech from Cyrus Field, who was received with great warmth, and from a Dutch gentleman, the toast-master called out, with a stentorian voice, "Mr. Turkey-nuff!" Into such a name had he coined that of the great Russian novelist, helped thereto by the sapient committee, who had printed his name on the programme Tourqueneff.

But why not? The English *Men of the Times*, which gives a column and a half to J. M. Mason, has no mention of one of the greatest novelists living; and though when Turganef* arose the crowd was at once impressed by the old man's grandeur—for he is even nobler in presence than Thackeray, whom he resembles—they did not realize who he was. The buzz of conversation went on, and those of us who wished to hear had to leave our seats and draw close to him. In earnest language he declared that English

* Contractions of by-out and by-in; meaning within-doors and without.

* The French spell it Tourguenief, and (so much may be said for the Scotch toast-master) I believe the author himself signs his name in a new way according to the country he is in. But critical Russians spell it Turganef.

literature had exercised a vitalizing influence upon the Russian mind, and that the two men who had most influenced it were Byron and Scott. Among other things the speaker said, "Our national poet, Pushkin, used to say that if Scott treated with such calmness and simplicity kings and heroes it was because he felt himself their equal before posterity, and they formed for him his natural and every-day society." Turganef also spoke impressively of the influence Scott had exerted upon foreign writers in reminding them of how much may be gained by looking close around them in their own countries, and by approaching literature by the path of national feeling and patriotic sympathy. Various Scotch noblemen made speeches, but said nothing very noteworthy. Lord Houghton, whom I have suspected in late years of being rather lazy in the preparation of his many after-dinner speeches, made a brief and eloquent speech in response to "The Roof-tree of Abbotsford:"

"To build up a roof-tree, to raise up children, and bring together kinsmen beneath it, to be himself a local habitation as well as a name, Abbotsford as well as Walter Scott, this thought haunted every happy hour, and added gloom to the sorrow of his later years. To you, at least, there is nothing strange in this desire; and whatever the philosopher or the divine may find in its indulgence to criticise or condemn, he must admit that this devotion to an idea does not prevent a Scotchman from attending sedulously to his more material interests in this life, or from maintaining the firmest faith in that which is to come. Assuredly the affluent day-dreams and long, methodical labors of the author of 'Waverley' might sanction and justify the most enthusiastic visions of the cadet of Harden and the kinsman of Buccleuch. But it was not so to be. Oh, the wild winds of fortune that raged against that roof-tree! Oh, the sharp and rapid strokes of death that strove to bear it down! Where is the band of mourners who of right bore the last sable covering over that chief of the hearts and minds of men? Gone the brilliant Lockhart, whose delightful biography of his father-in-law there are few here who this week have not read once more—gone William Scott of Raeburn, Charles Scott of Nesbitt, James Scott of Jedburgh, Sir James Russell, Robert Rutherford, William Keith, and Lord Polwarth—gone the boy for whom he wrote those charming tales—gone the two sons, the natural inheritors, then in the prime of life! Is it that Nature, in her wide compensation, assures most certainly the full hearth and the distant progeny to the less gifted and the more obscure? Is it that Providence desires to spare the descendants of the greatest the responsibility or the burden of a glorious name? We

have no Shakspeare, no Milton, no Bacon, no Newton, no Pope, no Byron; Italy has no Dante, no Petrarch, no Ariosto, no Alfieri; Germany has no Goethe, no Schiller, no Heine; France has no Montaigne, no Descartes, no Racine, no Voltaire, no Lamartine. Yet here it is not altogether so. Beneath the roof-tree of Abbotsford stands a youthful form, the last lady of the line; to her we tender Scotland's affectionate homage and the sympathetic interest of mankind, and pray that she may long live in health and happiness to cherish and transmit the memory of this illustrious day."

The room had been hot, to begin with, and had gradually become stifling. In the centre of it there had been a large block of ice, two feet square, cut into the shape of Edinburgh Castle. We who sat at a distance from it beheld with envy the siege of the eager souls near it under which the fortress yielded, and when it had melted away we also melted. Some, also, who had come expecting something to eat, became hungry and moved off. Owing to the fact that the hospitalities of Edinburgh had not left me to the tender mercies of the Centenary committee in this regard, I was enabled to remain to the end of the affair, and join in the hearty singing of the social hymn of Scotland, "Auld Lang Syne," which the two thousand sang, and kept on singing along the streets far into the night.

Any sentiment about Scott that one might have lost by a too free indulgence in the celebrations at Edinburgh was restored to him who was fortunate enough to pass from "Auld Reekie" to the solemn grandeurs of Melrose. Mr. Emerson once said that men required rhyme and rhythm as they do beautiful architecture. I never knew the full meaning of that saying until I stood amidst the sad, sweet, dream-like ruins of this holy place. In that solitude poetry seemed the only language that could be spoken; and the mind ached to see once more that poet who had loved to stand there alone, and read aloud from the strange tomb that fascinated him:

"Earth walketh on the earth
Glistening like gold;
Earth goeth to the earth
Sooner than it wold.
Earth buildeth on the earth
Palaces and towers;
Earth sayeth to the earth,
All shall be ours."

No fitter epitaph could be written for a stone under the walls of Melrose, and to turn from the walls so steadily lapsing into Nature's domain is most thrilling. Yes, Nature is taking back again what Art took from her heart and raised for a temporary purpose. The ivy has climbed over the trees of stone till the birds see no difference between them and the forest, and build their nests in them. The carven foliations sow

themselves to real leaves; and the bluebell is there to call the reverent to worship. The souls in pain, whose writhing heads and forms sustained the niches of saints, have fulfilled their time and task: the saints have nearly all crumbled, and the burdened ones are being set free by the light, and smile in flowers.

After having passed some mornings in observing portraits of Scott and his friends, and pictures of his environment, I was the better able to invest Abbotsford with some of the realities of the old days. As I approached the superb castle I saw, as it were, the wraith of the old baronet in the field—the tall, thick-set, ruddy-faced, and rugged man, with somewhat heavy features, relieved by a keen, restless, and humorous gray eye; limping, he is yet elastic, and his dress—gray trowsers, green jacket, and white hat—is an odd blending of the vesture of youth and age; and the whole benevolence of the face beams out when he pauses to speak a few words with the gardener, and whistles low to the dog that bounds to receive his gentle patting. Such were the face and form which the best art of Scott's time had rescued from mortality. Yet the pictures were of transient impressiveness in comparison with one face I casually saw at Abbotsford. There passed along the garden a fair and stately young lady, whose face showed her lineage. There was little of the Lockhart look. The face is that of Scott.*

Abbotsford is now, far more than when he who built it so described it, a "romance in stone and lime;" for he had gradually added to it memorials of that old Scotland which never passed away so long as he lived, and hallowed all by the bequest of his own spiritual presence. No sooner do we pass through the ample gate-way than we enter the anti-quarian realm. Hung on the gate is the iron collar by which offenders were fastened at Thrieve Castle in the time of the Douglasses, who dwelt there. All around the mansion, incorporated in the wall or set against the inclosure, are old armorial relics, with inscriptions. On one is the device of a sword, with the words, "Up with ye sutors of Selkirk!—A.D. 1525." Another has on it—

"By night, by day, remember aye
The goodness of ye Lord,
And thank his name, whose glorious fame
Is spread throughout ye world.—A.C.M.D. 1616."

The stone fountain which once stood upon the Cross of Edinburgh, ancient querns, the stone which was once above the old college hall of the same city, inscribed with the line of Seneca, "Virtus rectorem ducemque de-

* Mr. Hope-Scott, the present owner of Abbotsford, is one of the Hopes of Hopetown, not a descendant of the author of "Anastasia." He married a daughter of Lockhart, and added the name of Scott to his own. The lady I saw was his daughter, the great-granddaughter, therefore, of Sir Walter Scott.

PORTAL OF THE OLD TOLBOOTH, TRANSFERRED TO ONE OF THE WALLS OF ABBOTSFORD.

siderat: vitia sine magistro discuntur," and many other curious old things, survive to give to the building, in itself quite modern, the sentiment of antiquity. The most interesting thing of this kind is the old portal of the Tolbooth, which was presented to Sir Walter Scott when that building was pulled down, in 1817. Above it are the words, "The Lord of armeis is my protector; blissit are they that trust in the Lord.—1575." Near the door-way is a figure in marble of the poet's favorite dog, Maida, with the inscription:

"Maidæ marmoræ dormis sub imagine, Maida,
Ad januam domini; sit tibi terra levis."

But the exterior objects at Abbotsford are not all from Scotland. There are old Roman figures, Egyptian gods, pieces of ancient pottery; and foreign things of the same description surround the court-yard. Entering the door, we are shown the ancient keys of Selkirk jail, and the gag for scolding wives (husbands, of course, never scold); the keys of the Heart of Mid-Lothian, or old Tolbooth; the last suit of clothes worn by Scott

KEY OF THE OLD TOLBOOTH WHEN USED AS A PRISON.

—white hat, scarlet waistcoat, plaid, and gaiters, all under glass; Marie Antoinette's clock; the grate of the murdered Archbishop Sharpe; the trunk, with its spring lock, in which the poor girl shut herself up, as related in the "Mistletoe Bough," whereof the attendant tells us, to our astonishment, that it was "sent from Venice to Sir Walter Scott, and was brought from a remote part of the building a few years ago that the Queen might see it."* But every thing in this little entrance hall is curious. The wainscoting is from Dunfermline Palace, and the carvings are copied from Melrose and Roslyn. The roof is adorned with sixteen armorial shields of the Scott family, three of them bearing clouds and the words, "*Nox alta premit.*" And there is a double row of escutcheons, whose story is told by the words, "These be the coat armories of the clans and chief men of name wha keepit the marchys of Scotland in the auld tyme for the kynge. Trewe men war they in their tyme, and in their defence them God defendyt." We pass through a little gallery of pictures, the most notable of which is one of Queen Elizabeth dancing the Highland fling. Then we see the armory, all glittering with the interminable varieties of knives, cutlasses, daggers, swords, guns, pistols, and arquebuses, where-with the ancient Scotsman fulfilled the whole duty of man—love God and kill your neighbor. Here is Rob Roy's musket (thereon "R. M. C."), and other heroes' guns; also their swords and daggers; Bonaparte's pistols, found in his carriage after Waterloo; pistol of Claverhouse; sword given by Charles I. to the Marquis of Montrose; blunderbuss of Hofer's lieutenant; and along with these ancient matchlocks, Roman spears, and the like; so that a military Darwinian in our

company found himself able to make out the evolution of deadly weapons from the first flint arrow, without any "missing link." In a case I observed Queen Mary's charity-box in accidental proximity to a thumb-screw, showing how close thorn and rose grow together on the religious stem. Also Burns's tumbler, Queen Mary's seal, Rob Roy's sporran, or purse, a pocket-book embroidered by Flora M'Donald, a silver urn presented by Byron. These and many other relics found enthusiastic worshipers in our party.

I enjoyed more the drawing-room, with its beautiful Japanese paper and figures, its superbly carved old chairs (presented to Scott by George IV.), and its exquisite pictures. In the drawing-room and dining-room there are invaluable portraits and busts—Chantry's bust of Sir Walter, portraits of Essex, Cromwell, Charles XII. of Sweden, Claverhouse, Charles II., and the head of Queen Mary in a charger. In the dining-room (the room in which Scott died) there is the portrait of the ruddy, stalwart "Beardie," the great-grandfather of Sir Walter, who, after the execution of Charles I., vowed never to cut his beard again until the Stuarts were restored. Such was the house-maid's version; but as Charles II. was crowned just two years after his father's execution, it is evident that Beardie had learned to cherish his immunity from shaving, and continued his shaggy appendage for other than patri-

THE ENTRANCE HALL, ABBOTSFORD.

* This box, or chest, is shown in the accompanying engraving, "The Entrance Hall." It stands on the right, beyond the fire-place.

otic motives. There is a charming picture of Hogarth, by himself; one of Nell Gwynne; Mary Scott, the blooming "Flower of Yarrow;" and Anne Scott, as a barefoot dairy-maid. One of the pictorial treasures of Abbotsford is a series of six admirable little paintings by Turner, all in one frame. They represent the castles of Tantallon, Linlithgow, Hawthornden, Bothwick, and two scenes of Edinburgh, all being in the very best style of Turner.

From the library, with its twenty thousand volumes, we pass into the study, which engravings have made so familiar to all. Silently our little company enter the last room, silently stand, and file slowly out. For there, in that chair of leather, at that table, Walter Scott sat at his task.

A few years ago I strolled along the seashore at St. Andrews with Robert Chambers, and heard him speak of the days when he sat beside Walter Scott in this very room. I seemed to look into the great man's eyes and hear his happy voice, as I looked into the eyes and heard the voice of one who learned from Scott what untiring industry joined to talent could accomplish. And it was with peculiar interest that I read in *Chambers's Journal* two years ago these words: "I know no brighter picture in the history of genius than this of Sir Walter Scott sitting down to his morning task dressed in the green velvet shooting-jacket

DRAWING-ROOM, ABBOTSFORD.

ABBOTSFORD—ROOM IN WHICH SCOTT DIED.

of a Scotch laird, with his books and papers around him on the desk and on the floor, his favorite hound eying him from the rug, a couple of spaniels gamboling with his children in the garden, and the songs of the birds pouring in through his half-open window. Scott knew nothing of those feelings of irritation that make composition a torment to so many men. His study was always open to his children no less than to his greyhound. He never considered their tattle as any disturbance; they went and came as pleased their fancy. He was always ready to answer their questions; and when they, unconscious how he was engaged, entreated him to lay down his pen and tell them a story, he would take them on his knee, repeat a ballad or a legend, kiss them, and set them down again to their marbles or nine-pins, and resume his labor as if refreshed by the interruption."

Even when we remember that he had, by advice of his physician, ceased from

"lengthening the day
By stealing a few hours from the night,"

and learned that it is better to burn daylight from five to nine in the morning* than lamp-light from eleven to three at night, after Byron's fashion, it must remain a marvel how

* In the winter he kindled his own fire to spare the servants.

THE ARMORY, ABBOTSFORD.

he could manage to accomplish so much in a house perpetually full of visitors, and a neighborhood where his every step was way-laid by lion-hunters. Anne Scott states that there were on one occasion thirteen ladies'-maids in the house; and Lockhart mentions sixteen uninvited parties coming in one day. Cadell, one of Constable's partners, expressed to Scott his wonder that he could write at all. "I know," he said, "that you contrive to get a few hours in your own room, and that may do for the mere pen-work; but when is it that you think?" "Oh," said Scott, "I lie simmering over things for an hour or so before I get up; and there's the time I am dressing to overhaul my half-sleeping, half-waking *projet de chapitre*; and when I get the paper before me it commonly runs off pretty easily. Besides, I often take a doze in the plantations; and while Tom marks out a dike or a drain as I have directed, one's fancy may be running its ain rigs in some other world."*

* I have been informed by several elderly gentlemen that Scott's was the most generally known figure about Edinburgh. He could be seen every day by any one who chose to walk into the court-room, where he sat, with two others, on whom (especially in later life) he threw the chief burden of administering the law. It was while sitting in that place that many of his novels were composed. He would sit in dreamy abstraction, quite oblivious of the lawyers' arguments, and equally unconscious of the large groups that were generally present for the sole purpose of gazing upon him.

Carlyle wonders that Scott did not set poison-paper for the fatal species of flesh-flies, or blue-bottles, who infested his abode. "A slightly splenetic man, possessed of Scott's sense, would have swept his premises clear of them: Let no blue-bottle approach here, to disturb a man in his work, under pain of sugared *squash* (called quassia) and king's yellow! The good Sir Walter, like a quiet, brave man, did neither." Lockhart's accounts of the parties at Abbotsford show that many who flocked thither were by no means blue-bottles. And even from those who were, one is bound to confess receiving occasionally considerable amusement. Thus, a few days ago, in looking over an old magazine, the *Mirror*, of date 1832, I came across the buzzing notes of an unmistakable blue-bottle which hovered obstinately around Abbotsford in the summer of 1829. The picture he conveys in his forgotten gossip is even more suggestive of what characters were around Abbotsford in those days than that of Lockhart. Here are some extracts:

"I came on the top of the coach from Jedburgh in company with two intelligent fellows, a young Englishman of fortune (apparently) and a Russian nobleman. We put up at the 'George,' where we found about five tourists, redolent of sketch and note books, drinking toddy and lying in wait to catch a sight of the lion of the neighborhood. The voracity with which they devoured any anecdotes of him was amusing. In the evening it came on a peppering storm. We had in old Davidson, the landlord of the inn, and my companions submitted him to an interrogatory of three long hours' duration. One little anecdote of fresh occurrence struck me as possessing some interest. About a month before a poor maniac presented herself at the gates of Abbotsford. She desired to see Sir Walter. The servant denied her admittance; but such was the earnestness of the poor creature, that 'auld Saunders' informed his master that 'a puir demented lassie was at the gett greetin' like a bairn.' Sir Walter had the kindest of hearts: 'Oh, admit her, puir thing,' he said. Her story was simply this. She belonged to Aberdeen; she was married to a young farmer in that neighborhood. The pains of childbirth had injured her mind" (I am compressing Blue-bottle somewhat; he says, for instance, "mental equanimity" instead of "mind"), "and, eluding her keepers one evening, she set forth to find the great enchanter whose works had beguiled her happier hours. She had traveled for a week; the distance from Aberdeen to Abbotsford was about one hundred and fifty miles. She had walked every step. Sir Walter did what he could to soothe her, and get her wasted frame recruited; but after some time deemed it necessary to send her to an asylum at Jedburgh. A post-chaise was sent for from old Davidson, and Sir Wal-

ter induced the poor girl to enter it, promising to accompany her 'out a-ridin'.' She entered, looking for him to follow. The door was instantly closed, and the postboy, lashing his horses, darted off in a second. She gave a piercing shriek, exclaiming, 'Ah, deceitfu' man, hae ye beguiled me too!' and then sank back in the carriage, and buried herself in the deepest silence.....

"As I was pacing the great aisle of the abbey (Melrose) this night, a carriage drove up to the gate. 'Sir Walter Scott,' said the keeper, brushing past me to receive him. A lady alighted. I heard 'Good-night' responded by a person in the carriage, who drove off with it. It was dusk; the lady advanced with a stately step. I moved aside. 'In these deep solitudes and awful cells!' methought I heard her say. She ascended to the bell-tower. 'Who is that lady?' said I to the keeper when he entered. 'That, Sir,' said he, 'is Mistress Hemmins, the poet writer, wha is on a visit to Maistre Lockhart, and she wants to be alane, Sir, by hersel'.' I took the hint, and made for the 'George' and my glass of toddy, unwilling to deprive the world of those lays which Melrose, the rush of the Tweed, and midnight would no doubt inspire in the fair authoress.....I took the boat at the ferry, and, resting in the middle of the Tweed, saw a person on the opposite bank appearing and disappearing in the wood. He was dressed in a short green coat and cap, and was amusing himself with the antics of a large dog. 'Who's that, lassie?' said I to my little boat-rower. 'That, Sir? that's *himself*; that's the shirra' (sheriff).....I was introduced to Jamie Hogg, the Ettrick Shepherd. We got over a jug of toddy. Our conversation turned on the service of the kirk. I pointed out that a fair fame might be made by arranging the Psalms of David, and superseding the barbarities of Sternhold and Hopkins. James maintained that the present edition in use in Scotland could *not* be improved. He said the question had been agitated in the General Assembly, and Sir W. Scott was applied to, to furnish an improved versification, but he answered that it would be more difficult to get the people to adopt them than to furnish the same. Any alteration in this respect would be looked upon as little better than sacrilege, and he therefore advised that the present form should be continued in. 'Watty's a sensible chap,' said the Shepherd, 'and if he laid a finger on oor venerable psalmody I wad pitch a louse at him, wha hae ever loved the man as my ain brether.'.....We found the Tower (Smailholme) in possession of a party, and Mr. C—— rode forward to report, in case we should be deemed intruders. He came back shortly, and it was no other than Sir Walter himself, with several members of his family, who had accompanied him to bid a final farewell to *Smaillum Keep*,

the scene of the 'Eve of St. John.' As I afterward heard, he was in the highest spirits, and repeated the poem for the gratification of his party. The party brought a cold collation with them. Before leaving, Sir Walter surveyed the beautiful prospect at his feet, the Tweed and Teviot meeting in sisterly loveliness, and joining their waters in the valley, with the golden fields of England in the distance; when, filling a glass of wine, he drank with fervor, 'Baith sides of the Tweed!'"

But this is enough of the matter as seen from the Blue-bottle point of view. Fortunately we can all get much closer to the lion than he could, and we find him much more than a lion. No pleasanter anecdotes have been told of any man. These are generally well known, but I will trust that the following may be new to my readers. Mrs. John Ballantyne was just married. She was young, the beauty of Edinburgh, and half spoiled by flattery. She was to meet Sir Walter at dinner, and resolved to put on airs, and show the great lion of the time that she was not to be brought to fawn even at his feet. He asked her to take a glass of wine, and she affected not to hear him; but the great man, instead of noticing this girlish folly, proceeded to talk to her with such politeness that she speedily felt ashamed of herself. This lady related that once, at her own table, on the occasion of a large and ceremonious dinner-party, there was a scarcity of spoons, and what added to the awkwardness, at the precise moment when the servant was washing the spoons for farther use a most determined pause in conversation occurred. The silence was so profound that no sound was to be heard save the whispers of the servants just without, and the washing of the spoons. At last the blushing lady's husband drank "Relief to all in distress," which broke the spell, and set all laughing, while Mr. James Ballantyne called out, with a line of Shakspeare:

"My lord, my lord, methinks you'd spare your spoons!"

"Not I, indeed, my lord," responded Mrs. B., "for I have none to spare." "Not amiss," said Sir Walter, in genial recognition of the lady's hit. Next day a parcel came to her, directed in an unmistakable handwriting, containing a dozen of the handsomest spoons that could be obtained in Edinburgh.

This same old lady relates a story which deserves to be told as one of the most singular among the curiosities of literature. She relates that once when her brother-in-law James was reading to her, Scott entered, and told him to go on reading. As the reader proceeded, Scott at first nodded approbation, then said, "Good!" next, "Very good!" "Charming!" "Powerful!" until at last the upper lip began to elongate, and even to tremble, and the tears fell. Snatching his

staff, he strode across the room, and looked over Mr. Ballantyne's shoulder to see what the volume was. It was the "Lay of the Last Minstrel." He was quite in discomfiture, dashed the tears indignantly from his eyes, uttered an impatient, "Pshaw!" and said, "God help me, James; I am losing my memory."

Mr. Alexander Ireland, of the *Manchester Examiner*, recently gave me an account of a visit he once made when a boy to see Abbotsford. It was long before traveling was made easy, and it was mainly through enthusiasm that this Edinburgh boy (the author of a charming bibliographical essay on the works of Hazlitt and Lamb) managed to get to the spot where so many bright creations beckoned him. "It was," to use Mr. Ireland's own words, "in 1828. The place was not shown when he was at home; but as I had seen him the day before in Edinburgh, I presumed he was not at home. I went in a friend's gig to Galashiels, and while my friend was pushing his business I walked to the bank of the Tweed opposite Abbotsford, and was ferried across. On presenting myself at the door, a servant told me that he could not admit me, as his 'maister was at hame, and naeboddy could be admitted when he was there.' At this moment Scott came into the hall on his way out to the grounds, and, on seeing me, asked the serving-man what I wanted. I told him I had come out from Edinburgh to see the place, not being aware that he was at home, as I had seen him in court the day before. He smiled, and said, 'Let him see every thing that is to be seen. You are welcome to see the place, Sir;' and then passed on, his dogs gamboling about him. He looked hale and hearty, was dressed in a black and white checked shepherd's plaid suit, and had a belt on, stuck full of knives, hedge-bells, little saws, etc., for cutting and pruning timber."

The most remarkable thing, perhaps, about the work of Scott was its occasional character. He begins translating a ballad to please a lady, and writes a great poem for another, for whom "he would have written a poem on a broomstick, if she desired it." The desire of helping an old school-mate's printing-press leads him to edit and annotate old ballads, and he has no higher ambition. The necessity of raising a thousand pounds to pay off his brother Thomas's debts was the final cause of "Marmion." And so literature lured him on and coaxed out of him by love or necessity the superb harvest that lay in him. He wrote rapidly, and wrote much—perhaps too much; but the facts show to be quite ungrounded the idea which some entertain that he was hasty in the sense of neglecting to attend to the details of his work. On the contrary, few authors have ever been

so careful in preparation, as few have been so swift in execution. While collecting the Border ballads we find him actually traversing the Border, frequenting Carlisle almost as if he were a Cumbrian, and visiting all the aged people from whom there was the least chance of his getting any old ballads or new versions. While writing "Marmion" he passes most of his time at Portobello, the small sea-side village near Edinburgh, between which and the city lies Prestonpans, and just beyond which is Tantallon Castle. He surveyed every foot of the battle-fields concerning which he wrote, as well as every vestige of the historical or traditional records concerning the incidents and the men engaged in them. When about to write the "Lady of the Lake," he hastens from the Court of Session with Mrs. Scott and his eldest daughter to pass the summer amidst the scenery on which he had fixed for the frame-work of his story. He galloped from Lake Vennachar to the rock of Stirling, to make sure of the practicability of a good horseman riding over the distance within the time allotted to Fitz-James after his duel with Roderick Dhu. Similar facts might be related concerning the pains taken in preparing the materials of nearly all of his works. In visiting the lakes and the Hebrides I found the "Lady of the Lake" and the "Lady of the Isles" the best guide-books, and every natural tableau in them clearly traceable.*

During the Centenary festivities the Emperor of Brazil arrived in Edinburgh, and on the first morning of his stay he went at five o'clock in the morning, with the "Heart of Mid-Lothian" in his hand, to try and identify the localities about the region where the old Tolbooth formerly stood, described in the novel. A gentleman and lady at whose house he took luncheon assured me that the emperor had succeeded admirably in his identifications, which he declared to be due to the precision and vividness of Scott's descriptions. (Should my reader ever make a similar attempt, he may be assisted by the accompanying engraving, taken from an old painting of the Tolbooth in the possession of Mr. W. F. Watson.)

Scott's characters were also flesh and blood. His first love lives in Margaret Branksome ("Lay of the Last Minstrel"); the dearest of his early friends, William Clerk, reappears in Darsie Latimer; his father's friend, George Constable, is portrayed in Jonathan Oldbuck; an old character who used to stand bare-headed at a street corner

* Sometimes indeed, though rarely, Scott evolved his scenery from his inner consciousness. Thus, in visiting the locality in Dumfriesshire associated with "Guy Mannering," I could find no rocky place nor wildness resembling the environment which adds so much to the weird impressiveness of the apparition of Meg Merrilies.

THE OLD TOLBOOTH (HEART OF MID-LOTHIAN).

in Edinburgh, trying to raise money enough to educate his son for the ministry, blended with Launcelot Whale, Scott's old teacher at the grammar school in Kelso—a grotesque, absent-minded old man near seven feet high—to make up Dominie Sampson; David Ritchie, the Black Dwarf, was a well-known personage; and in Saunders Fairford and Alan Fairford, of "Redgauntlet," we have faithful portraits of Scott's father and himself. Mr. Smellie Watson, R.S.A., has kindly permitted me to take a copy of the portrait of Jock Gray, the fidelity of whose delineation in Davie Gellatley—the droll letter-bearer of "Waverley"—living witnesses attest.

In a very wild spot about five miles out of Peebles there is still preserved some trace of the little hut—much smaller than that in which Thoreau dwelt at Walden—in which the Black Dwarf lived. The place from which he dug the stones of which he built his diminutive castle is pointed out. Those who now dwell there have built a larger house, but they have incorporated or imbedded the Dwarf's room in it, and taken particular care to keep in all its rudeness the window at which he was wont to sit. All around Peebles the traditions of the Black Dwarf are still quite fresh, and many anecdotes are told concerning him.

Scott was too much of an artist to be servile to his characters. He would introduce them for a purpose—often giving an etching

of them generally—and leave them. Sometimes, therefore, his portraits of character, when associated with the originals, however good so far as they go, do them injustice by reason of their being applied too closely by the readers. In some instances, again, inquiry concerning some original has shown a much more interesting character than Scott has depicted. This is the case with Jock Gray. Jock, or John, Gray was by no means so "daft" as the Davie Gellatley of "Waverley." He lived at a place in the south of Scotland called Gilmanscleugh, and is said to have been known over an extent of fifty miles around by a singular kind of wit that mingled with his half wit. There seems, indeed, to have been a division of parties about him in Peebles, in Selkirk, and other regions, as to whether he was really crack-brained, or was only assuming that manner in order to conceal a deeper purpose, as Alcibiades at the banquet spoke more freely from his mask of intoxication. However this may be, Jock Gray by his power of mimicry became a terror to all the parsons of his region, inasmuch that they grew pale when he entered the kirk. Seemingly, Jock paid no attention to the sermon; he was accustomed to walk softly about from gallery to gallery, like, some said, "an evil spirit." When he observed any one asleep in church he reached over and awakened him with a tap of his "kent;" if the offense was repeated, the blow grew proportionately severe. It is still a habit in Scot-

JOCK GRAY, THE ORIGINAL OF "DAVIE GELLATLEY."

land to let those who "have a want" have their way in every thing, arising partly, I suspect, from the ancient sanctity attached to such persons, and no one ever thought of interfering with Jock during his wanderings through the galleries, or when he came at last to rest on the pulpit stair. On the next day he was pretty sure to be surrounded by a laughing crowd on some common, delighting them with a felicitous reproduction of the discourse, the knack of the preacher being caught. Jock was especially good at caricaturing any kind of pulpit exaggeration or loudness, and it is said that some vehement preachers were reformed by the dread of his powers of mimicry. Sometimes Jock recited a curious kind of doggerel, which he called his poetry. Some old people remember him as having, on one occasion when his mother refused him something, climbed to the top of the Eildon Hills, and, having rolled a snowball until it became of fabulous size, hurled it over a precipice, where it lay melting through the entire summer. His power of singing was good, and this, with his mimic

talent, and a tenderness for his half-witted condition, procured for him a welcome in the farmers' cottages in the whole region around.

A great deal of interesting information, I have been told, concerning Gray and other characters of Scott, was contained in a book by Robert Chambers, entitled "Illustrations of the Author of Waverley." This book must have been one of the first, if not the very first, ever written by Mr. Chambers. It was published in 1822. It was noticed by Sir Walter Scott in the preface to the "Monastery," passed through two editions, and yet, after trying every important library, I have not been able to see a copy. Even Mr. William Chambers, Robert's brother, who printed the book, replied to my inquiry that he had no copy, and knew of no one who had. I have never known of a case in which a modern book seems to have so utterly perished out of existence. I have counted in the British Museum Library over four hundred and ten different works by or about Scott, representing over a thousand vol-

umes, but Robert Chambers's book is not among them.

All these facts point to that which was, after all, the chief felicity of Scott's genius—namely, his disposition to seize on what was immediately around him as the material out of which to spin and weave his tissue of romance. With this tendency of his mind all the conditions of the time and place in which he wrote conspired. Scotland had closed the last page of her history as a power among the nations. With a national life and sovereignty merged and lost in the union with Great Britain, there remained from the past a story unsurpassed for brilliancy, full of situations the most glorious, and illuminated by rare heroisms. Back of these was a wild, half-fabulous, half-real environment of legend, tradition, and realms haunted by the poetic phantasms of German and Celtic superstitions. When Scotland had lost its distinctive nationality, it was necessary that all these, its rich store of history and legend, should pass by the wand of art into imperishable forms of beauty. Scotland must pass into poetry and romance. It may be admitted that Sir Walter Scott could only do in part what must necessarily be, in large degree, the work of many minds, and of that highest interpreter of all—Time. The Wizard of the North did indeed call all the spirits from the vasty deep of Scottish history and fable; but there were some that did not come at his bidding. The heroic figures which had loomed amidst the long struggles of his country were indeed embodied in living and radiant forms, and victories worthy of them were won in the eyes of an applauding world where history had shown them all but grand episodes of the dreary record of steady defeat. So far the work that had waited for the hand that could accomplish it was fairly done by Walter Scott; the great chiefs and warriors of ancient Scotland will always be seen and estimated as they appear in his pages. The same satisfactory account can not be rendered of his service in relation to the weird mythological and legendary lore of Scotland. He does, indeed, show a wide acquaintance with the ancient customs, superstitions, ghost stories, and, measurably, with the folk-lore of his country; but he clearly did not understand the value of these superstitions. His ghosts are uninteresting, his apparitions are purposeless, his elves are frivolous and unpoetic. In part this may undoubtedly be attributed to the fact that the science of comparative mythology hardly existed half a century ago; but still more it must be ascribed to the fact that no man who is himself superstitious can possibly interpret superstitions.

Scott dealt with the most commonplace supernaturalism, and has not even given us a good collection of the most significant and

distinctive myths around him, and this plainly because his imagination was mastered by things which, had he possessed a philosophical intellect, it would have mastered. In reading "The Monastery" one can not help feeling that though the author had copied the mouldings of Melrose roof, and the figures on its walls, to adorn the panelings of Abbotsford, he had never got any nearer to them; and the mighty shades of the past which each represented passed by him unrecognized. He could not see the mystic eye beneath the mask. In a generation when the clear-headed Napoleon believed in astrological destiny, and when Byron prized an amulet taken from a Celtic barrow enough to steal it, one must not bear too severely upon the superstitions even of educated men; but, at the same time, it is impossible not to feel, in reading Scott's novels, the grotesquerie frequently introduced into them by this element. Those who have read Lockhart's "Life of Scott" and the "Letters on Demonology and Witchcraft" will not need to be reminded that the great novelist was not only a ready listener to all goblin stories, but that his mind was seriously affected by personal experiences to which he attributed a supernatural origin. He connects (so early as 1818) noises heard at Abbotsford with the sudden death of a friend in London on the night following that in which the noises were heard. Though in print he tells the story of his seeing Lord Byron after death as a mere vision, his personal friends declare that he told it privately so as to impress listeners with the idea that he believed it real. He dwelt upon a vision he had of a cart and horse tumbling over a bank some two hours before such an occurrence actually took place. He believed in second-sight, and was vexed if any one explained instances of the kind on natural principles. Robert Chambers was once walking with Scott through St. Andrew's Square, Edinburgh, when they met a gentleman clad in deep mourning. They recognized him as an associate clerk of the court, and Scott conversed with him a few moments. The gentleman mentioned the death of a grown-up daughter, and said that it was not the first incident of the kind which had occurred in the family. After parting with him Scott shook his head, and referred to a Highland curse which had been uttered eighty years before against that gentleman's wife's family, on account of her ancestor having given up to the government the unfortunate Marquis of Tullabardine, who, flying from Cul-loden, had taken refuge with him in Dumbartonshire, relying upon some old family ties.

What true art can do with the element of mystery the countrymen of Nathaniel Hawthorne and of Poe need not be informed. Of that delicacy of touch which can use

preternaturalism for mystical beauty, while reserving for the intellect a freedom from the necessity of literal acceptance, Scott knew nothing. But, after all deductions, it may be claimed that his romances made Hawthorne and many another possible; nay, that to some extent he determined the artistic form in which much of the imaginative work of the generation that followed him should appear, and that not alone in countries speaking his own language. The tribute of Goethe to Scott was no less significant than is that of the Russian novelist Turgenef to-day.*

Auguste Comte, who refashioned the Christian Year into a Positivist Year, and substituted for the calendar of saints a calendar of great men, named the month of August after Dante, and set apart the nineteenth day of it for homage to Sir Walter Scott. In his "Positivist Library for the Nineteenth Century," consisting of one hundred and fifty volumes, Comte names "the seven masterpieces of Walter Scott: 'Ivanhoe,' 'Quentin Durward,' the 'Fair Maid of Perth,' the 'Legend of Montrose,' 'Woodstock,' the 'Heart of Mid-Lothian,' 'The Antiquary.'" It is curious that while Scott has received this homage from the French philosopher, the greatest of his own countrymen should have denied him the term "great." There is perhaps no piece of modern criticism more significant than that of Carlyle upon Scott, written in the *Westminster Review* in 1838. No one who has read that article can fail to recognize it as one of the most impressive and characteristic ever written by its author. "Winged words were not his vocation;

nothing urged him that way; the great mystery of existence was not great to him; did not drive him into rocky solitudes to wrestle with it for an answer, to be answered or to perish." What splendor of the ages shines through these words! The sun-god whose dart pierces the python, the archangel with his foot upon the fallen Satan, St. George with the writhing dragon beneath him—these are the flaming banners that floated over the stone-mason's son of Dumfries-shire, who at the close of the last generation pointed men to new monsters to be slain—Pauperism, Anarchy, Wrong. "The thing he had faith in"—charged he whom the world now calls the worshiper of mere force!—"except power, power of what sort soever, and even of the ruder sort, would be difficult to point out." This criticism is, as I say, significant. Really it is the criticism of one age on another. It was toward the close of Scott's life that there arose over the horizon that little cloud which soon after his death darkened the whole sky with spiritual and social agitations. Scott felt the first breath of the fast-coming age of skepticism more than can be discovered from his works or his biographies. The steady refusal of Scott to go to church, and his resolute suppression of all conversation on religious topics when any considerable number were present, were regarded by his neighbors as ominous; and the blunt revelations of the Ettrick Shepherd showed that their suspicions of heresy were well founded.* He breaks off acquaintance with Paterson when he hears he has been preaching at Galashiels, and whispers to the Shepherd, "If ever you choose a wife, Hogg, for goodness sake, as you value your own happiness, don't choose a very religious one." He was tender of the religious feelings of all; and among some "Recollections," published by Fraser in 1837—which, though anonymous, I learn were written by Robert Gillies—there is a story of his being in great distress when his skeptical friend Pinkerton, the antiquary, got into a theological controversy with a lady at his table. A lady present came to his help by volunteering a new song, after which Pinkerton was beguiled into a discussion on the obelisks at Meigie. A gentleman who, when a boy, haunted the court-room to gaze on Scott, and, when a youth, saw him at Ab-

* Goethe's interest in Scott, however, was not so spontaneous as might be supposed from a sentence of his which has been considerably quoted of late. Mr. Carlyle told me that Goethe was attracted by Scott's having selected "Goetz" for translation as his first considerable literary venture; and at a later period he admired the vast extent of the labor which the novelist performed—none the less, perhaps, because he inclined to the belief that, like some Continental authors, he must have a kind of writing staff at Abbotsford, whose spinnings he wove into the tissue of his romance. Carlyle was on one occasion the bearer of some medallion portraits of Goethe which the latter wished to convey to Scott, and also of some very important suggestions, facts, and estimates, which the great German wished the author to be in possession of concerning Napoleon, whose life, as was known throughout Europe, he was writing. These medallions and the messages—which were as favorable an estimate of Napoleon as could be given in accordance with the facts—Carlyle took to Scott's residence in Edinburgh. But Scott had left for Abbotsford, to remain there for three months, before the elapse of which Carlyle had to leave for London. He left the portraits of Goethe at the house, and confided the messages to be delivered by Christopher North. Some time afterward he received from Scott an acknowledgment of the portraits, but there was no reference to the important messages, nor was there any trace of their influence in the biography of Napoleon. He (Carlyle) was somewhat annoyed at this; but after Scott's death he learned through Lockhart that Professor Wilson had never delivered them at all.

* Indeed, throughout Scotland Scott's popularity was seriously affected by the universal opinion that he had not written in a noble or appreciative strain of the Cameronians—those brave religious reformers who refused to bend to Charles II., and were hunted to death by Claverhouse and others. The story of those Cameronians is one which even yet thrills the Scotch breast so often as it is related, and their tombs around Peebles and in Dumfries are still visited by pilgrims as the tombs of martyrs. Scott wrote of them coldly, and he has never been forgiven for it. To this day, except with Scotch Tories, he is more revered in England than in Scotland.

botsford—who also was intimate with the Laidlaws—assured me that the author was any thing but orthodox. I make these allusions only to show that he also had felt the touch of that period of misgiving and doubt which was so soon to overtake England and New England. When Carlyle and others were importing the daring speculations of German thought, Scott sat many an hour reading and pondering them, then sighed “for a small drop out of St. Leon’s bottle in order to grow young again and join in working the Tentonic mines.” But as Walter Scott’s mother attributed her son’s career to his lameness—but for which he would have been a soldier—so most of us will rejoice that he lived too early to be drawn out of his true realm into the stormy revolution of thought. From the overcast sky of that day which followed the mellow sunset of Scott’s life Carlyle was himself the first thunder-bolt. He whose burden rolled through the land—“Woe unto them that are at ease!”—was pretty sure to discern a hand of flame on the ornate walls of Abbotsford, where a comfortable old baronet had sat amidst light-hearted singers and story-tellers, sipping his wine and spinning out romances. Not beautiful could that mild satisfaction with the world as it was, that succession of literary picnics, be to a captain around whom all manner of Chartists, Socialists, Transcendentalists, and a hundred different reforms were struggling in the very thick of battle. It was from the depth of that sad, introspective age, and from the very Hamlet of the time—“sicklied o’er with the pale cast of thought”—that there came the stern criticism on Scott. We do not underrate the long transitional conflict that intervenes between the generation of Scott and our own—are we not all its children?—when we affirm that we can estimate more clearly the claims of Scott now than Carlyle could amidst the struggles of 1838. Not to pursue the question whether that introspective habit of mind which seeks rocky solitudes can consist with that “health” for which Carlyle so praises Scott, so many clouds have floated into light that we can afford to be calmer than our intellectual fathers, who called all to leave their tasks and help save the ship, and cursed as idlers those who lingered with any muse. Among other things we can see that it is not the office of Art to slay monsters for us. High as that work may be, there is a place for Shakspeare as well as for Luther. Indirectly, indeed, he who heightens the ideal beauty is also tugging at the long arm of the lever which raises the world; and there is a moral in the story that Apelles saved his country by a picture which touched the heart of Alexander after the Rhodians had failed to withstand his arms. There are, indeed, some who are for all time equally, and among these—very

few!—Scott may not ultimately be set by impartial criticism. But the best that can be urged concerning him now is that strictly impartial criticism of him is, for the present, impossible. What! shall we count over the faults and appraise each blemish in the loved circle that surrounded us in the morning-time of life? In the far distance, and through the lens of a tear, one can see only the sunshine of their hair, and all their eyes are of tenderest blue. And, blending with those forms of memory, hardly less real than they, are those hallowed forms which from their haunt on the Tweed went forth to the ends of the earth. As they sat by us in the chimney-corner, and made the rainiest day brightest (if it meant a holiday with the blue-covered book), as they called us to heroism, or watched with deep eyes over our couches till shaped in our dreams, even so they are held fast in the heart of childhood in a sanctuary beyond criticism. The wings which this Dædalus made to bear us from the narrow confines of practical life are such as the sun can not melt; under its intensest beams these pinions are but painted anew. The experience of advanced life finds us still struggling to reach and realize those fair ideals.

Carlyle never met Scott in personal intercourse. At the time when the novelist was the great lion he (Carlyle) was repelled by Scott’s vehement Toryism, being himself a warm radical. It was during the agitations which preceded the Reform bill of 1832, and Scott made himself much more odious to the reformers than can be gathered from his biography. Among other things he attended a popular meeting held at Galashiels, and made a speech, in which he wished the meeting to go in a body and help the Tory government to suppress the agitators by force. Personally popular as he was in his own neighborhood, this was more than the people could stand, and they hissed him vigorously; whereat the old man became very angry, and, telling them that he “had no more respect for them than the beasts of the earth,” he took up his hat and left them. Carlyle sympathized with the indignation caused by these things among the liberals. One day, when walking with Jeffrey, they met the novelist, and while Jeffrey stopped to converse with him, Carlyle sauntered on. On Jeffrey’s rebuking him for this, Carlyle said he could never see “any majesty in Scott.” Nevertheless, in later times Carlyle was considerably more impressed by the largeness of the old man’s labors, and, in particular, was interested in “Waverley.” He told me of seeing him driving one day into Edinburgh, surrounded by his family, and seemingly the happiest of men. He looked after him as he passed, and acknowledged to himself that the fortune and happiness he witnessed had been well earn-

ed. Not long after he heard that the "Wizard" was hopelessly bankrupt, and that the fine carriage and every thing else was for sale. Yet long after he had condoned Scott's Toryism, and come to esteem his works more highly, Carlyle could never share in the enthusiasm for him; and when lately the effort was very earnestly made to induce him to preside at the Centenary, he could not make up his mind that he would be in his right place at the celebration, and so declined.

Having said so much concerning the manner and the character of Scott's work, let us for the rest consider, in the light of the dates, circumstances, and amount of it, how unparalleled was his career as a phenomenon in the history of literature.

In 1783, when both were about twelve years of age, he and James Ballantyne were school-mates at the grammar school of Kelso. About sixteen years later Ballantyne had established himself at the same place as editor and publisher of the *Mail* (weekly) newspaper, and he requested Scott to write him some paragraphs on legal questions. This was in 1799. Scott had been studying law at Edinburgh, leading a harum-scarum life, and dabbling in politics. He had fed on the stories of Montrose and Claverhouse, had become a furious Tory, had mixed in a theatre riot in Edinburgh by attacking some fellows who swore by Robespierre and called for revolutionary tunes, had been bound over to keep the peace anent three broken heads laid to his charge, had written a war-song (1797), had been made sheriff of Selkirkshire with £300 a year, had been crossed in love, and had married. The suggestion of Ballantyne pleased him, and once, when carrying to the editor certain paragraphs of the kind mentioned, he showed him some metrical translations from Bürger, which he desired him to print. He had written the first of these, "Lenore," one night for Miss Cranstoun, who said he would be a "cross between Burns and Gray." When these ballads were printed to an extent sufficient to make a little pamphlet, Ballantyne printed them in that form, chiefly to prove the excellence of his typography to the Edinburgh folk. The pamphlet contained "William and Ellen," "Lenore," "The Wild Huntsman," "The Fire-King," and a few others, and was entitled "Apology for Tales of Terror." The copy of this little thing of seventy-six pages—described by its motto as "a thing of shreds and patches"—owned by Sir Walter Scott is in the Abbotsford Library. It bears the autograph, "Walter Scott," and opposite, in the same handwriting, "This was the first book printed by Ballantyne of Kelso; only twelve copies were thrown off, and none for sale." So much more did the author, at that time, think of the career upon which his friend was en-

tering as a publisher than of himself—a humility which was characteristic. I felt deeply thrilled looking upon this lowly beginning of a life which was to give two hundred volumes to an admiring world. His next venture before the public was with translations of "Goetz," and "Tales of Wonder," without much success. After this Scott told the same friend that he was engaged in collecting some old Border ballads, and thought they might make "a neat little volume." This volume grew into "Border Minstrelsy," the first two volumes of which were printed by Ballantyne in 1802—800 copies—Scott's share in the proceeds of which amounting to £78 10s., the first money, perhaps, which his literary labor ever brought him. The earliest copy of this, with its beautiful picture of Hermitage Castle, was lent by its owner, Mr. Gibson Craig, to the Loan Exhibition at Edinburgh, and, seeing it, one can not wonder that it at once brought the "Ballantyne Press" into notice. It is probable that during Scott's romantic sojourn in the neighborhood of Carlisle, where he found his wife, he discovered what rich materials for a collection of this kind were scattered about. At any rate, the thousand copies first printed were soon disposed of, to be followed by five more editions before 1820, and to be translated into the German, Danish, and Swedish languages. The success of this work induced Ballantyne to remove his press to Edinburgh, where, in an obscure street, near Holyrood Palace, he began the issue of many of the most famous works in Scotch literature. Among the first things there printed was the "Lay of the Last Minstrel," near 44,000 copies of which were sold between the year of its publication (1805) and 1830. Like "Lenore," the Lay owed its origin to a lady—the Countess Dalkeith—who told him the story of Gilpin Horner, and insisted that he should turn it into a ballad. In the year before that Scott had edited "Sir Tristrem: a Metrical Romance of the Thirteenth Century. By Thomas of Ercildoune, called the Rhymer." Only 150 copies were printed, and these at the price of two guineas each; so the work was little known. The tremendous success of the Lay led to a private partnership between the author and Ballantyne, by which the former was to have a third share in the profits of the business. By this time Ballantyne and Co. had become printers for Constable and Co. Two copies of the earliest issue of the Lay were in the exhibition; one that of the Abbotsford Library, the other belonging to the Queen. On the fly-leaf of the former was written, "Mrs. Scott; from her affectionate son, the author." The copy owned by the Queen was very interesting on account of the many additions made by the author, and the following on the fly-leaf: "This copy was prepared for the second edition, upon

the principle of abbreviating the notes recommended by the *Edinburgh Review* in their notice of the poem. But my friend Mr. Constable would not hear of the proposed abridgment, and so the antiquarian matter was retained.—W. S., 15th June, 1821." In the same year (1805) Scott planned a rather ambitious edition of the British poets, ancient and modern, which was to be sold at a very high price; but the scheme was abandoned, and he went to work editing Dryden and writing "Marmion." The latter was published in 1808 in splendid quarto form; price one guinea and a half. Constable paid the author the handsome sum of one thousand guineas for it. Lockhart estimates the sale of it up to 1836 at 50,000 copies. Scott was much irritated by Jeffrey's criticism of "Marmion," and attributed it to political hostility. This led to a quarrel with Constable, and his aiding in the establishment of the *Quarterly Review* as a Tory rival to the *Edinburgh*; also to the setting up of the firm of Ballantyne and Co. disconnected from and competing with Constable. For the next two years Scott put forth editions of various works—"Queen-hoo Hall," Carleton's "Memoir of the War of the Spanish Succession," "Memoir of Monmouth," "Sadler's Life and State Papers," the "Somers Tracts"—for all of which he was well paid. In 1810 the "Lady of the Lake" appeared (the manuscript of which was exhibited by Mr. Richardson, its owner), for the copyright of which he received two thousand guineas. Its sale is estimated by Lockhart as equal to that of "Marmion," or 50,000 copies up to 1836. Then he edited the poetical works of Miss Seward, with prefatory memoir. He wrote the "Vision of Don Roderick," to assist the unfortunate Portuguese of Massena, and it brought them one hundred guineas. Then followed "Rokeby." "I well remember," says Lockhart, "being in those days a young student at Oxford, how the booksellers' shops there were beleaguered for the earliest copies, and how he that had been so fortunate as to secure one was followed to his chamber by a tribe of friends, all as eager to hear it read as ever horse-jockeys were to see the conclusion of a match at Newmarket; and, indeed, not a few of these enthusiastic academicians had bets depending on the issue of the struggle which they considered the elder favorite as making to keep his own ground against the fiery rivalry of 'Childe Harold.'"

Immediately before the publication of "Rokeby" Sir Walter Scott's fame as a poet culminated. The man himself seemed, too, at his zenith. He had long had before his eyes an air-castle hovering on the banks of the Tweed, and now he was able to realize it. But just as he was building a cottage at Abbotsford came temporary embarrassments. The separation from Constable had

proved disastrous to Ballantyne and Co., and Constable had to be applied to for aid, which he rendered, and this first cloud passed away. The first poem written at Abbotsford was "Rokeby," and it was, as to popularity, a failure. The "Lord of the Isles," the "Bridal of Triermain," the "Field of Waterloo," poem after poem, drama after drama, fell flat on the ear of a public whom Byron had carried away as a hurricane. The "favorite" was run off the track; and, to use his own expression, he will no longer "play second fiddle to Byron." Such was his conclusion when Ballantyne came one day to inform him that he must yield the poetical sceptre to his rival. Then died Scott the poet, and from his ashes arose the Wizard of the North.*

A sad man, somewhat confused by a paralysis fallen on his muse, searching one day for fishing-tackle, comes across the forgotten first chapters of an old story which he began to tell years before, but which a critical friend persuaded him to lay aside. Fished up so out of a forgotten lumber garret, the manuscript blossoms to "Waverley." The humiliated poet trembled as he put it forth. Never was severer seal put on lip than that which withheld Ballantyne from disclosing the real figure masked under "A. of W." To his publisher's pleading he answers with the following bit of pleasantry:

* Stunned though Scott was when Ballantyne told him that he must yield the palm to Byron, it is remarkable that neither then nor at any time during the long and avowed rivalry between these poets did any bitterness of feeling escape Scott. In that encounter, though Byron conquered as a poet, Scott shone more brightly as a man. When "Hours of Idleness" was published, Scott was undisturbed at the satire on himself in it. Mr. Gillies remembers that Scott said to him, after perusing it, "There can not be a doubt that Lord Byron has considerable power; how he may use it, or whether he will write any more, it is impossible to guess. *Facit indignatio versus*; but spleen and gall are disastrous materials to work with for any length of time." There is reason to believe that Byron regretted that the one uncourteous incident of the race should be on his side. Lady Blessington describes him as speaking of Scott's poems with enthusiasm, and of the author himself even with emotion. As for Scott, to the last he never thought of appealing against the verdict of the public on their respective merits. Mr. John Gibson, who was Scott's law agent, and who lives now in Edinburgh, says that when the author was amidst his pecuniary embarrassments, and expecting to be relieved of them by his pen, he (Gibson) expressed doubts of his being able to accomplish the gigantic tasks he had set for himself. Scott's answer generally was, "Time and I against any two."† On one occasion he said he had no fear of his works not finding a ready sale, "for since poor Byron died there is no other for whose works the publishers care so much as for my own."

† This was Scott's motto to his friends in those days. Mr. Gibson says that when he asked William Laidlaw, soon after Scott's death, whether he recollected any thing particular that had fallen from him on the death-bed, he said, "No; only I remember that one fine afternoon, when the sun was shining bright into his bedroom, but he was very low, I said, 'Cheer up, Sir Walter; you used to say, *Time and I against any two*.' Upon which he raised himself on his elbows, pushed back his night-cap, and merely said, '*Vain boast*,' fell back on his pillow, and relapsed into silence."

"No, John, I will not own the book—
I won't, you picaroon!
When next I try St. Grubby's brook,
The A. of Wa— shall bait the hook,
And flat-fish bite as soon
As if before them they had got
The worn-out riggler—Walter Scott."

He never acknowledged the authorship of the Waverley novels until 1827, when he did so in a speech at a theatrical fund dinner in Edinburgh. About 40,000 copies of "Waverley" were sold previous to the publication of the first uniform edition of the novels. Two years later (1816) appeared "The Antiquary," the first edition (several thousand) of which was exhausted in six days. This was in May. In December of the same year appeared "Tales of my Landlord," which was equally well received. "Rob Roy" (1817) started with an edition of ten thousand, which speedily vanished from Constable's shelves (the dramatic representation of it realized three thousand pounds); and the "Heart of Mid-Lothian" (1818) took Edinburgh by storm. In June, 1819, Scott revised the proof-sheets of the third series of "Tales of my Landlord," while on a bed of illness from which he thought he would never rise; but in December of the same year "Ivanhoe" came forth to electrify England. In that month, and January, 1820, he wrote the three political essays of "The Visionary." In March, 1820, Longman published "The Monastery," to be followed in September by "The Abbot." Next to "Ivanhoe" the greatest success of that period was "Kenilworth," with which the year 1821 opened. Between this and "The Pirate" (December, 1821) the indefatigable writer had put forth good editions of "Frank's Northern Memoir," "The Contemplative Angler," "Chronological Notes on Scottish Affairs, 1680 to 1701," and written a brief "Life of Smollett." The "Fortunes of Nigel" appeared in the May of 1822, and was especially popular in London; and the dramatic sketch, "Halidon Hill" (for which Constable paid Scott £1000), followed in the next month. The year 1823 brought forth "Peveril of the Peak," "St. Ronan's Well," and "Quentin Durward," which latter at once created a sensation in Paris, surprised and delighted to see Louis XI. and Charles the Bold rising again at the magician's call. The people of Innerleithen were rejoiced to find every trait of their scenery, and their neglected well (St. Ronan's), invested with romance for all time. "Redgauntlet" appeared in 1824—a novel whose charm was not at first so great as now, when it is known to be more intimately blended with the author's personal experiences than any other of his productions. In 1825 "The Talisman" met with an enthusiastic welcome. On March 1, 1826, the "Letters of Malachi Malagrowther" appeared, and on the next day Scott wrote "The first Epistle of Malachi, al-

ready out of Print." In June of the same year was issued "Woodstock," which brought Scott the sum of £8228.

While this novel, "Woodstock," was on his hands—indeed, when the first few pages of it were first written—the great crash came. The financial troubles amidst which the unfortunate firm of Ballantyne and Co. had wound up (temporarily only, for that firm exists to day in full vigor) had, by the aid of friends, left Scott unscathed. The kindly part borne at this period by Constable had brought Scott again to his old publisher. The unexampled success of the novels had brought the author to (for that time and region) great prosperity. The constant stream of romance which issued from Abbotsford, which he had now built into a castle, returned to him in a steady and full stream of gold. He had declined the laureateship in favor of Southey, but was made a baronet in 1820. He could spend £3500 in purchasing a company for his son, who had become a hussar, and the hospitality of Abbotsford had become imperial. In 1822 we find him receiving the King, and subsequently he was entertained by the King in London. So matters stood with the briefless barrister of the closing eighteenth century; and so they stood when, on a terrible day, Constable failed, and Scott had to leave proud Abbotsford a ruined man, over £100,000 in debt.

Never did man receive a shock with more nobleness. "God grant me health and strength, and I will yet pay every man his due," he said. When he heard of his bankruptcy he was engaged on the "Life of Bonaparte," from which he turned occasionally to "Woodstock." Between the third day after hearing of his ruin and the fifteenth day this stunned man had written an entire volume of "Woodstock." He declared his belief that for a wager he could have written the volume in ten days. Whatever may be the verdict on Scott as an author, there can be no doubt about what manhood was in him, when we read this entry in his journal of a fortnight after his loss: "I have now no pecuniary provisions to embarrass me, and I think, now the shock of the discovery is past and over, I am much better off on the whole.....I shall be free of a hundred petty public duties imposed on me as a man of consideration, of the expense of a great hospitality, and, what is better, of the waste of time connected with it. I have known in my day all kinds of society, and can pretty well estimate how much or how little one loses by retiring from all but that which is very intimate.....If I could see those about me as indifferent to the loss of rank as I am, I should be completely happy. As it is, time must salve that sore, and to time I trust it."

Mr. Gibson, at present Writer to the Signet

in Edinburgh, to whom I have before referred as Scott's law agent, had charge of the sale of his furniture at Abbotsford. The following extract from a letter he received from the author in those sad times shows how his heart clung to the things which had surrounded him far more than did his pocket. "There is, by-the-bye," he writes to Mr. Gibson, "a large picture of the Cave of Staffa hanging in what was my room, which was given me by the laird, and therefore I should not like to sell it. Also another trifling thing in the dressing-room—a mahogany thing, which is called a *cat*, with a number of legs, so that, turning which way it will, it stands upright. It was my mother's, and she used to have the toast set on it before the fire, and is not worth five shillings of any one's money. Yours very truly, W. SCOTT."

Beneath is scrawled the following, which I give in fac-simile:

"THIS IS THE CAT."

It is needless to add that both the picture and the cat were secured by Mr. Gibson, and sent to the author.

In 1827 the "Life of Bonaparte"—in the preparation of which Scott had passed six weeks in Paris—appeared, and it brought the amazing sum of £18,000, which went immediately to Scott's creditors. From the continuing proceeds of his collected novels these gentlemen presently received £40,000 more. The "Chronicles of the Canongate," second series of "Tales of a Grandfather," the "Fair Maid of Perth" (all in 1828), "Anne of Geierstein," third series of "Tales of a Grandfather," the "History of Scotland," Vol. I. (all in 1829), the "Doom of Devorgoil," "Auchindrane," "Essays on Ballad Poetry," "Letters on Demonology and Witchcraft," "Tales of a Grandfather" (fourth series), "Tales of my Landlord" (fourth series), and "History of Scotland," Vol. II., with several minor essays and reviews (all in 1830), represent the unequalled energy whereby the old baronet paid off his creditors sufficiently to return to Abbotsford with something of his old prosperity. Nay, his creditors, who throughout had acted honorably, now presented him with his library, furniture, relics, plate—in amount equal to £10,000.

But to accomplish all this the old man had given up more than he thought. He is found in 1830 lying senseless on the floor of his dear Abbotsford under an apoplectic attack. This is not the worst. A mad political pamphlet warns his friends that the mental life has suffered also; and when he has written the last novel, "Count Robert of Paris," that same old friend Ballantyne,

who once had to tell him that he must concede the palm in poetry to Byron, is forced to tell him that "Count Robert" is an utter failure. Most sad is the entry thereon in his diary: "The blow is a stunning one, I suppose, for I scarcely feel it. I am at sea in the dark, and the vessel leaky, I think, into the bargain. I have suffered terribly, that is the truth, rather in body than in mind; and I often wish I could lie down and sleep without waking. But I will fight it out if I can." Alas! such efforts to "fight it out" as "Castle Dangerous" only proved more plainly that the night had come, in which, as he at last sadly said, no man can work. In a ship placed at his disposal by the government he sails to the far south, and in sight of Pompeii he writes a new tale for his friends to suppress—"The Siege of Malta." He even begins another, but now indeed the pen falls finally from his hand. To reach Abbotsford, that he may die there, is now the one task left him. By slow stages he is borne thither, and at last his old steward, Laidlaw, meets him at the porch. "Ha, Willie Laidlaw! Oh, man, how often have I thought of you!" In the effort to fondle the dogs that come about his knees he sinks to stupor. Slowly the weeks creep on; again and again he demands to be set up at his desk, only that his head may fall upon his breast, and the pen fall from his fingers. He will have the Bible and the church service read and re-read to him, listening with a serene light on his face in the intervals of his slumber. Until at last the slumber gently falls on his eyelids to be lifted no more. Of date September 21, 1832, is the brief note which Mr. Watson, of Edinburgh, showed me, written by William Laidlaw: "I have to inform you that Sir Walter Scott died an hour ago." What epitaph more fit and true for him than the last words he addressed to those who gathered around him: "I am drawing near the close of my career. I have been perhaps the most voluminous author of the day; and it is a comfort for me to think that I have tried to unsettle no man's faith, to corrupt no man's principles, and that I have written nothing which on my death-bed I should wish blotted."

They laid him to rest in Dryburgh Abbey, and the finest minne-singer and storyteller of Scotland could have found no fitter tomb. Embowered amidst venerable trees, festooned with ivy and every climbing plant, that spot which the Celts named Darach-Bruach ("The bank of the sacred oaks") reminds us how both pagan and Christian loved to worship where nature was most beautiful. (And yet, alas! an instrument supposed to be connected with human sacrifice was once found there.) "That no demons might haunt it," the grounds were consecrated on St. Martin's Day (A.D. 1150), but no consecration could keep the English

TOMB OF SCOTT, DRYBURGH ABBEY.

of Edward II.'s time from devastating them. But poets, more than demons or English soldiers, always haunted the old abbey. Canon Patrick's muse mourned over its ruin five hundred years ago. Ralph Strode, author of "Witty Fables" and the "Image of Radulphus," the friend of Petrarch—"the philosophical Strode," as Chaucer called him—wrote and studied beneath these trees; and Gower, the poet (Chaucer's "moral Gower"), was a Dryburgh monk. About two and a half centuries ago Dryburgh was purchased by the Haliburtons, Scott's ancestors, and it was thus he and his family have been buried there. Haunted by other than poets is Dryburgh. Far beneath these graceful springing arches, and pillars so tree-like that they are now hardly distinguishable from the grove, are dungeons that still make one shudder, and holes for human hands to be wedged in with driven wedges around the wrist. One of these dungeons is called *Fatlips*. Its story has been told by Sir Walter himself: "An unfortunate female wanderer took up her residence in a dark vault among the ruins of Dryburgh Abbey, which during the day she never quitted. When night fell she issued from this miserable habitation and went to the house of Mr. Haliburton, of Newmains, or to that of Mr. Erskine, of Shielfield, two gentlemen of the neighborhood. From their charity she obtained such necessaries as she could be prevailed

on to accept. At twelve each night she lighted her candle and returned to her vault, assuring her friendly neighbors that during her absence her habitation was arranged by a spirit to whom she gave the uncouth name of *Fatlips*; describing him as a little man wearing heavy iron shoes, with which he trampled the clay floor to dispel the damps. This circumstance caused her to be regarded by the well-informed with compassion, as deranged in her understanding, and by the vulgar with some degree of terror. The cause of her adopting this extraordinary mode of life she would never explain. It was, however, believed to have been occasioned by a vow that during the absence of a man to whom she was attached she would never look upon the sun. Her lover never returned. He fell during the civil war of 1745-46, and she never more would behold the light of day. The vault, or rather dungeon, in which this unfortunate woman lived and died passes still by the name of the supernatural being with which its gloom was tenanted by her disturbed imagination, and few of the neighboring peasants dare enter it." The strange story of this woman was mingled with the legend of the "*Smaylho'me lady*" by Scott in "*The Eve of Saint John*."

"There is a nun in Dryburgh bower
Ne'er looks upon the sun;
There is a monk in Melrose tower,
He speaketh word to none.

"That nun who ne'er beholds the day,
That monk who speaks to none,
That nun was Smaylho'me's lady gay,
That monk the bold baron."

It was a relief to turn away from the dungeons and damp holes, with their weird memories and legends, and meet the only "*Fatlips*" of Dryburgh in a little merchant of photographs and of trifles, as plates, paper-knives, and boxes, "made out of Abbotsford wood." The only "bold baron" was a big, red-haired Scotchman, who stood at the gate and exacted a toll of fourpence on each one entering; this he did with the true baronial, or, I may say, Robroyal air wherewith the same exaction is made at every turn in Scotland; for going in a gate or not going in a gate, for entering a steamer or for leaving it, you must generally pay certain moneys. No doubt—and I give this theory to comparative mythologists gratis—the dragon that guarded Hesperian fruit, the three-headed dog that guarded Eurydice, and the like, were folk who demanded threepences of visitors. I know that if I were to describe the toll-takers who mulet strangers at every step in Scotland in accordance with my feelings, I should lay the basis for a new mythological monster. To the man who took twopence of me for getting on the Loch Lomond steamer at Torbet I said, "You ought to be ashamed of your-

IN THE REFECTORY.

self." "Ashamed of taking tuppence!" exclaimed Sandy, fairly bewildered at the idea there could be any disgrace in procuring that sum by any means whatsoever.

What a contrast would the old Premonstratensian monks, with their white cassocks and rochets, and shirtless skins, who used to pray and penance and punish themselves and the neighborhood here seven hundred years ago, find should they wake up, like the nuns in Meyerbeer's "Robert," and see us gayly disporting ourselves on the grassy floors, and making the old arches ring with our laughter! Did the dust of any of them stir that day as some scientific heretics, fresh from the British Association at Edinburgh, walked over it? Did the old Tory lords who sleep there not feel a bit of pain when a certain light-figured and fair girl, the daughter of John Bright, and a whole bevy of radical girls, went tripping about the sacred spot? And did Strode and Gower, the old poets, care not a spirit-rap as the author of "Day and Night Songs" passed by? Or have the ancient parties learned by this time that as Dryburgh sows itself into vine and flower, so thoughts and beliefs like theirs sow themselves into a harvest like that which waved momentarily over their dust that day when one of the science excursions visited that spot?

The day was very pure and perfect; a balmy summer day, with the gentlest of breezes fanning one at every step. I had asked the "bold baron," who, having taken our fourpences at the gate, reappeared as a guide, where was the exact spot in the abbey where the White Maid of Avenel was wont to appear in obedience to a spell. The guide answered that the spell which would call her up was now lost; but I pettishly remarked that I was well acquainted with the spell, and had only asked him for the spot. He had said the spell was lost in a humorous way; but when I replied that I knew it very well, he looked into my eye gravely, and seeing me quite serious moved away, though he had been plainly indulging hopes of another fourpence. Left to my own devices, and apart from the rest of the company, I selected the spot which I thought that most likely to be favored by the White Lady of Avenel, and lay down there to weave my spells.

I saw her coming out of the far past. First, as a face shaped by a pure white cloud, adored by wondering worshipers on the banks of the Ganges; next, as Aphrodite, white like the sea-foam from which she is born, idealizing the sensuous naturalism of Greece; later, as the blonde and golden-haired Frigga, the beautiful earth-goddess of Germany, who lit up the darkness when Odin rode forth on his wild hunt, until under the touch of Christianity she became the "Teufelsbrut" of superstition; and then again the glorified saint whom the Whitby peasant still sees now and then all radiant in the highest window of her ancient abbey of Streansshall—

"The very form of Hilda fair,
Hovering upon the sunny air,
And smiling on her votaries' prayer."

Lightly poised in the air stood the White Lady, her golden zone brighter than when Glendenning gazed on it, but her face not now terrible, but sweetly sad, betokening death, not coming but past. And from the deep avenue of the trees, whither her eye was directed, there came a shadowy procession. Of the old bridge over the Tweed the flood has swept away nearly all; but they who now bore the hearse, and followed it so mournfully, could pass through the air, and their footfalls, as they wound up the hill and entered the ancient cloister, made no leaf rustle. Seven hundred years old is that yew which gives its evergreen to be laid upon the palled coffin. "I am the resurrection and the life," reads the clergyman. Then his voice falters—it stops. For a few moments silent grief, unbroken save by some sobs that can not be suppressed, make the true funeral of him around whose lifeless form the great multitude has gathered. Relatives, old and young, old friends who must

be assisted to the side of the grave, mothers who will have their children say in the future, "We looked upon the great man's coffin," servants who had known what it was to be treated as friends, peasants who had so often exchanged cheery greetings with one who added of his nobility to the whole district—all these gathered around the ancient Gothic portal. And long after the sound of the dust falling upon the coffin was past, and the harsh stroke of hammers riveting iron bars around the grave had ended, the throng lingered as if unable to tear themselves from the spot. The day sank toward the twilight, and at last the multitude has vanished.

From the phantom funeral* I turn, and behold! the White Lady is there still. She beckons to viewless forms in the air, and now these gather where the mourners of earthlier form had just now stood. Rank on rank they stood, these spirits, who had come to hover with downcast eyes around the Prospero whose wand, now broken, had called them into being. How shall I describe them? Oh, my friend reading this my vision, too near are these to your life and mine to be described! They are the friends of our childhood, recalling the days and the long evenings when they came from far to visit us, to twine about our hearts, to hover around our bedsides, and mingle sweetly with our dreams. There came the haughty Marmion, and the intrepid Fitz-James, Ivanhoe, and Macgregor—valiant or stern, proud or ambitious, they were now still and tender. They may have been foes whose fierce and gallant

conflicts once made the whole air of heaven thunder and flash above us. Here their strifes ceased, and their weapons were sheathed. Wild but tearful, as on Ellangowan, Meg Merrilies was here fulfilling her prophecy: "I'll be seen in this glen mony a night after these crazed banes are in the mould." And Old Mortality was there, forgetting all other graves but one. Hush! what troops of state-ly spirits are these? Deep-eyed Lucy Ashton, hast thou found the heaviest sorrow at last? And thou, Di Vernon—at whose name there rise around me faces that grow dim as I look on them—our rapt little circle of the chimney-corner, for whom thy spell made rainy days the brightest! Hand in hand here, the genii of the summer sky and of the star-lit night, Rowena and Rebecca; arm linked in arm, the peerless Jeanie Deans and the hapless Effie; Mina, Brenda, Norna, brought their boughs of yew and waved them gently, as if keeping time to some music inaudible to me, but to which the ever-increasing host of shadows seemed listening. At last I, too, heard the theme; at first like an Æolian strain, it sounded more clear as the Last Minstrel drew near with his harp, and sang:

"Call it not vain; they do not err
Who say that when the Poet dies
Mute Nature mourns her worshiper,
And celebrates his obsequies;
Who say tall cliff and cavern lone
For the departed Bard make moan;
That mountains weep in crystal rill;
That flowers in tears of balm distill;
Through his loved grove that breezes sigh,
And oak in deeper groan reply;
And rivers teach their rushing wave
To murmur dirges round his grave."

HOLLAND AND THE HOLLANDERS.

[Second Paper.]

CONSIDERED in all its aspects, Amsterdam is the most original and peculiar city in civilization. Thoroughly representative of Holland, it stands to-day a triumph of industry and energy over nature, and its commercial power and financial influence are felt throughout the globe. With the exception of Frankfort-on-the-Main, it is probably the wealthiest city, for its population, in the world; and its entire wealth has been earned by the most indomitable perseverance and untiring toil in the face of every obstacle.

The metropolis of the Netherlands has been for generations one of the greatest banking centres of the Old World. More

than fifty ancient and opulent firms do a large and prosperous business there, and the entire capital which all the bankers own and can control is said to be nearly \$1,000,000,000. They hold the bonds and securities of every recognized nation under the sun. All kings and princes are in some way indebted to them; while on the sluggish Amstel float golden argosies from every clime.

One of the richest and most noted banking firms in Amsterdam is that of Hope and Co., established in the seventeenth century by Henry Hope, a Scotchman, a descendant of John de Hope, who went in 1537 from France to Scotland as a follower of Madeleine, queen of James V. A leading member of the house, some fifty years ago, was Henry Hope, who was born in this country; his father having been a Scotch loyalist settled in Boston, Massachusetts. He lived some time in Quincy, Massachusetts, and was a poor youth when he emigrated thence

* "The throng of uncovered and reverential mourners stole along beneath the tall and umbrageous trees with a silence equal to that which is believed to accompany those visionary funerals which have their existence only in the superstitions of our country."—*Tait's Edinburgh Magazine*, 1832.

to England at the close of the last century. John Williams, an Englishman, who married Henry Hope's niece, and assumed the name of John Hope, afterward became the manager of the establishment. Among its silent partners was Thomas Hope, the renowned author of "Anastasius." Its financial relations with Holland, Spain, and Russia have been very intimate and extensive; and its influence at different times in Europe has been second only to that of the Rothschilds.

Gem-cutting has long been a specialty of Amsterdam, and was, at one time, exclusively confined to that city. The diamond-mills, as they are called, are entirely in the possession and under the control of Jews, nearly ten thousand of whom are employed in those establishments. There diamonds and other precious stones are cut and polished for all the jewelers of Europe—Antwerp being the only competitor Amsterdam has in this particular branch of trade. Unless you are a diamond dealer, you have no trouble in obtaining admission to the mills, the largest of which are partially worked by steam-engines.

DIAMOND-CUTTING IN AMSTERDAM.

The art of cutting and polishing is supposed to have originated in Asia at a very early period, but was first introduced into Europe by Louis Berquen, of Bruges, about the middle of the fifteenth century. He accidentally discovered that rubbing two diamonds together caused an abrasion of their surfaces, and from this soon deduced the art as it is now practiced. The process of polishing and cutting, as I observed in Amsterdam, is very slow and tedious, nearly every part of it, from the delicacy and exactness required, needing to be done by hand. The preparation of a single stone demands two months of continuous labor; and the famous Pitt or Regent diamond underwent two years of constant manipulation before it was complete. In the mills one diamond is employed upon another, each being cement-

ed into the end of a handle, and a model of lead being taken of the gem to be cut, which determines the faces. The stones are then rubbed together with a strong pressure, and held over a metal box with a double bottom, the upper bottom being perforated with small holes, through which the diamond dust falls. The dust is of such value that it is very carefully collected, and, after mixture with vegetable oil, is used for polishing the gem upon a steel or cast-iron plate, which is made to revolve rapidly, sometimes by steam, as I have said, but generally by means of a treadle. The diamond powder is also used for cutting. It is placed upon a steel wire or saw, and this, drawn swiftly backward and forward, makes the required incision. When a large piece of the stone is to be removed, it is occasionally done with a fine chisel and hammer; but this so increases the danger of breaking or destroying the gem, that it is rarely resorted to. No kind of work can be nicer or more difficult, for the workman must thoroughly understand the character and peculiarity of diamonds, and must have an absolute knowledge of the cleavage planes before he can be trusted with their manipulation.

The usual forms of cutting are the brilliant, rose, and table. The first, composed of a principal face, called a table (surrounded by a number of facets), which, when set, is all that is visible above the bezel, shows the gem to the greatest advantage, wastes it the least, and is therefore generally preferred. The rose, which is remarkably brilliant, is flat below, while the upper surface is entirely cut into facets. The table, much less beautiful than the other forms, is mainly confined to thin stones with a large surface, and cut into facets at the edges. Outside of India the table is seldom seen; and in the Amsterdam mills I was told that at least three-quarters of all the stones cut are in the form of brilliants.

The world-renowned Koh-i-noor caused great disappointment at the Crystal Palace Exhibition in London in 1851 by its inability to develop its colored refractions unless surrounded by vivid lights, and was, indeed, much inferior in appearance to its glass model in the Tower; consequently, after much counsel and examination, it was sent to Amsterdam to be cut. Much fear was felt as to the success of the operation; but the most experienced cutters there were so confident of a prosperous issue that the undertaking was made, after great preparations; and the Duke of Wellington himself went through the form of beginning the work. The result was altogether felicitous; and now the Koh-i-noor really deserves the name, Mountain of Light, which it never did when in possession of Nadir Shah, who gave it its resonant baptism.

The Koh-i-noor is not, as is often sup-

posed, the largest diamond in the world. Before cutting it weighed only 186 carats, and was much reduced by the process. The Orloff diamond, bought by Catherine of Russia, is considerably larger, being about the size of a pigeon's egg, and weighing 195 carats. This splendid stone once formed, it is said, the eye of a Hindoo idol in a temple of Brahma at Pondicherry, was stolen by a French deserter, and, after passing through various hands, fell into the possession of a Greek merchant, who sold it to the empress for half a million of dollars, an annuity of \$25,000, and a patent of nobility. Wilkie Collins, it is stated, founded in a measure his novel of "The Moonstone" on the history of this magnificent stone.

The largest and most valuable diamond known is presumed to be the one so long owned by the Sultan of Matan, Borneo. Its weight is 369 carats, and its estimated value from \$4,000,000 to \$5,000,000. The celebrated Austrian diamond, weighing 139 carats, is nearly the size of the Koh-i-noor; but the fact that it is yellow and of rose form renders it much less valuable. If it were white and cut in brilliant, it would be worth more than \$1,000,000; but as it is, less than two-thirds of that sum would be considered a fair estimate of its price.

Nearly all the owners of the Amsterdam diamond-mills are wealthy; but the operatives, though they have what is regarded as very good wages in Holland, are quite poor. Like the watch-makers of Geneva, they usually inherit their trade, their fathers and grandfathers having been employed in the same business. They are regular as clocks, laboring so many hours every day, and giving the strictest and most absorbing attention to their exacting toil, which is a constant strain upon their brain and nerves, no less than upon their senses and their muscles. They need to keep their heads clear and their blood cool to perform all the delicate manipulations necessary. The least dullness of sight or touch, or the smallest variation in handling, might do more damage than a whole lifetime of wages would make good. They very rarely spoil any of their work by any fault of their own; for they are so disciplined and trained to their calling that their hands obey their mind almost with the perfection of machinery.

Diamond-cutting seems to me a most dismal trade. The hundreds of men I have seen engaged in the mills appeared wan and worn and melancholy, as well they might, with their perpetual and monotonous round of cheerless and consuming toil. To them each day is like every other day. The seasons and the years come and go, and go and come, without chance or change. Their world is but a revolving disk; the straining of the eye, the tension of the nerves, a painful pressure of the hand against the little gem

which mocks them with its brightness, and defies them with its impossibility of possession. So, in one unbroken repetition of wistful work, their life creeps darkly on, and only when the end comes does their rest seem to begin.

We Americans are in the habit of associating a certain degree of material prosperity with the Hebrew race, because nearly all of its members who come to this country manage, by reason of their superior shrewdness,

THE JEWS' QUARTER.

perseverance, and energy, to make money. The Jews who migrate to the New World leave in the Old the infirm, the incapable, and the impractical of their people, who can be found in the different cities on the Continent helpless and indigent as rich men's sons suddenly overcome by adversity. Amsterdam has its full proportion of poor Jews, and their quarter in the city is as wretched, filthy, and gloomy as is the Jews' Quarter in Prague, or the noted Ghetto in Rome. It abounds in crooked lanes, narrow streets, vile smells, heaps of rags, and repulsive sights. Lazarus was a prince, perfumed and purple-robed, compared to many of the dwellers in and frequenters of that miserable neighborhood. Most of the diamond-cutters reside there, but they earn enough for self-support, and do not mar the fair face of day with their sores and tatters and misfortunes of every kind. Scores of those Hebrew families literally subsist year after year upon crusts, wear rags, receive alms or buffets from any or every hand willing to bestow one or unkind enough to give the other, and delude themselves with the fond fancy that they are living.

The prevailing opinion that there are hardly any poor in Holland must receive a positive negative from persons acquainted with the country. Strangers judge from outward signs, chiefly from professional beggars who waylay them with stereotyped petitions and invented woes. Failing to see these, they imagine the entire community comfortable and well-to-do. Public mendicants are scarce-

ly known in Holland, as strict laws exist and are enforced against them, and as ample provision is made for the needy by the municipal and state authorities. I learned in Amsterdam that the city supported not less than twenty thousand poor, which, for its population, is a very large proportion—nearly one-eighth of the entire community. The almshouses are among the most conspicuous buildings in town, and are, of course, kept scrupulously clean. They are in general comfortably full, though never overcrowded; and I have noticed that many of the paupers were extremely aged—some of them, I should judge, not far from centenarians. A very considerable part of them are Jews, though why hundreds of the unfortunate wretches I had encountered in their dreary quarter were not also occupants of the almshouses I have never been able to explain.

The spin-house—or work-house, as it would be named with us—in the Nieuwe Prince Gracht, is well worth a visit, although its regulations and the character of its inmates have materially changed of late years. One of its divisions was formerly devoted to the correction of such offenses as disobedience in children, extravagance in wives, and drunkenness in husbands, and this division was so constantly thronged that even the conservative Dutch came to the conclusion that they were punishing as sins against the state what was merely a violation of the duties and proprieties of domestic life.

Should we determine to have such an institution here, and should we faithfully commit all offenders to it, we should need to occupy the whole Central Park with the building, and it is questionable then if it would contain the vast number of transgressors.

I found in the spin-house many young people, who had been sent there for idleness, the pettiest of pilfering, and the slightest encroachments on the rights of others—such errors as we should either pardon or entirely overlook. The Dutch seem resolved to have good and just government in every thing, and are in no way inclined to condone even such negative faults as we consider part of the freedom of individuals.

The society called Felix Meritis, occupying a building in the Keiser's Gracht, was founded and is wholly supported by the residents of the city. It is devoted to literature, science, and art; bears some resemblance to the Royal Institution of London; contains a library, a museum, a collection of casts of ancient statues, chemical and mathematical apparatus, and a fine concert-room and observatory. Able lectures are regularly delivered before the society, to which strangers and foreigners are admitted, and which furnish a mental stimulus and liberal means of improvement to the cultivated portion of the community.

SCENE IN A DUTCH THEATRE.

Amsterdam has several theatres, where performances are given in French and German as well as in the native tongue. At two of the minor places of amusement variety entertainments are offered, and smoking and drinking allowed. One or two visits to these inferior theatres proved to me that, with all their natural staidness, the Dutch can make as much noise, with the aid of poor beer and common wine, as the nervous French or the excitable Italians. And then such clouds of smoke as they blew from pipes and cigars created an atmosphere similar to that of Liege, and made it impossible to see what was occurring on the stage.

The Dutch as a people are supremely domestic—even more so than their neighbors the Germans. Poverty may, and not infrequently does, prevent their marrying, but inclination never. Nearly every man whose circumstances will permit—and a very little money is regarded as an independence there—takes a wife before he is five-and-twenty, and he is usually engaged ere he is out of his teens. An engagement, though it often continues for a great while, is very seldom, if ever, broken, for the Hollanders are temperamentally disposed to keep promises, especially those of a connubial nature. They seem incapable of any kind of disloyalty, and flirtation, either before or after marriage, is hardly known to them. Their selection for life partners once made, they have no shadow of turning, but remain really as true as

the needle to the pole. Domestic troubles arising from overgallantry on the part of the man, or from inconstancy in the woman, are very rarely heard of, and the dockets of the courts are almost entirely free from suits for divorce. The Dutch heart, like the Dutch mind, is somewhat sluggish, and extremely slow to receive new impressions. What it has once accepted it keeps closely and firmly, without desire for variety, and without thought of change. The passional and emotional element is omitted in the national character, which is steadfast to stubbornness, and faithful to pledges and convictions under every variation of fortune and every shadow of adversity.

A bachelor is esteemed a sort of social monstrosity in the land of dikes and ditches, and a deep-rooted prejudice exists against celibacy. Philosophers of Malthus's school do not flourish there. On the contrary, the Hollanders practically respect and obey the Scriptural injunction, "Be ye fruitful, and multiply, and replenish the earth." The Alpha and Omega of a Dutchman's life are competence and family; and the smallness of one is often accompanied by the largeness of the other; showing, even in that region of exceptions, that, while necessity may be the mother of invention, poverty is still the father of many children. It is not uncommon for persons of middle age to be the parents of eight, ten, and twelve lusty boys and girls, who give rich promise that in due

season they will, in turn, contribute largely to the census of the kingdom. The private history of young persons patiently waiting until they can gather enough of this world's goods to justify them in beginning wedlock is often touching in its eloquent simplicity and earnest purpose. I have been told of numerous pairs, betrothed in their youth, who were forced by stern circumstance to delay their nuptials until their locks were thin and gray with age, and even of those who went loving and toiling, but still united, down the hill of life until, near the bottom, one was left alone, mourning, with a widowed but unwedded heart.

The preparations on the part of the expectant wife for her new condition are as many as with us, but with this difference—theirs are needful and substantial, while ours are chiefly luxurious and superfluous. An indispensable requirement to a Dutch bride is a vast quantity of personal and household linen, which the prospective husband must purchase, and she must make up. Such piles of sheets and pillow-cases, of towels and napkins, of table-cloths and esoteric raiment, are hardly known even to our munificence of outlay. Enough is purchased and fashioned into form to last, not for one or two years, but for the greater part of an ordinary lifetime. Cheap as such goods are in the Netherlands, money is so hard to get that their purchase, for persons in humble circumstances, demands much time and more toil. A romantic woman or an intense man, pricked by passion's burning spur, would be indifferent to such tedious collections. But romance, intensity, and passion, in our sense, are foreign to the Dutch, who cleave to custom and to precedent with unwavering zeal. Their ancestors, for many generations, have been unwilling to wed unless authorized by the possession of heaps of spotless linen, and they would be recreant to their country and themselves if they were satisfied with the smallest abatement of the prodigious supply. The washing of all this linen is a spectacle. It converts the homeliest dwelling into a spacious laundry, and renders water and soap, starch and flat-irons, the solemn and sacred agencies of an ablutionary providence. Day and night the process of rubbing, boiling, rinsing, drying, and all the rest goes on; the grateful but severe labor of the kitchen queen distracting her from every other consideration. She has her reward, thrice told, when the radiant linen is folded carefully away, and she wearily presses the snowy pillow her own red hands have made so spotlessly white.

After one has seen Amsterdam fully, the first of the suburbs he visits is the village of Broek. From my childhood I had heard it mentioned as the cleanest town in the world, and so many remarkable stories had been told me of its peculiarities and curious

customs that I took advantage of my earliest leisure to go thither. Broek has a population of hardly fifteen hundred, is only six miles from the metropolis, and is reached by the ferry-boat to Buiksloot, one mile distant, whence I walked to this most unique of civilized settlements. As I passed through the harbor of Amsterdam I observed that it was fenced in, so to speak, with long lines of piles driven into the mud, and having open spaces at intervals to allow the ingress and egress of vessels. At night these openings are closed with booms—large trees covered with iron spikes—which are drawn across and firmly fastened with chains. I noticed also upon the wooden piers, stretching out from the shores and above the water, rows of small pavilions or summer-houses. To these the owners are in the habit of going in small boats during the warm weather, and whiling away a few hours in chatting, smoking, and drinking beer, coffee, or wine, each and all of which are grateful to the Dutch palate. As I moved along over the sluggish waters I had an admirable view of the city through a net-work of shrouds and sails, spars and masts, above which rose quaint steeples and curious towers without number. The story I had frequently heard that Fénelon had borrowed his description of Tyre from his knowledge of Amsterdam then appeared probable enough. From no other point is that great commercial centre seen to such advantage. It is a picture of prosperity and industry, illustrating the variety and extent of its trade with every quarter of the globe.

The road from Buiksloot to Broek is dull and monotonous even for Holland. It runs by the side of a canal, and I saw, for the first time, men and women harnessed to and dragging boats along what we should call the tow-path, after the manner of horses in this country. The boats, or rather barges, were freighted with fruit and vegetables intended for the city market. The labor of drawing them was not so great as it seemed; but still the sight of human beings employed in the place of beasts of burden shocked not a little, I must confess, my sense of fitness and my liberal ideas. The men and women, however, did not mind their degrading occupation: they were only concerned about reaching their journey's end, and disposing of the contents of the vessels, in which they probably had at least a partial interest. They were coarse and stout to the last degree, and, but for the difference in their garments, it would have been difficult to determine sex. The voice of the women was heavy and harsh, and their half-bare arms were as large and brawny as those of the men. I could not perceive a ray of intellect in the countenances of either, or any thing about them indicating genuine humanity. They merely gave me an impression of physical strength

and stolidity, of being self-acting machines set in motion by a power superior to and independent of themselves.

I passed on the way a number of the peculiar habitations scattered all over Holland, and remarkable for their low walls and very high roofs, serving as store-rooms for winter stocks of hay. These are the cottages of the peasants and rural working classes, who, in such dreary but entirely cleanly abodes, rear large families, and are wholly content with earning two or three hundred guilders a year.

After lounging along nearly three hours, I reached Broek, built on the border of a small lake, reminding me at first of some of the toy villages I had seen in the shops of Nuremberg. Many of the inhabitants are landed proprietors, retired merchants, and wealthy tradesmen, with numerous thrifty manufacturers of those small, round Edam cheeses, which are shipped from North Holland to every part of Europe and America. Neither horse nor vehicle is allowed to enter the town—a regulation of the place with which I had long been familiar; but if they were allowed, it would be of no benefit, as the streets are too narrow to admit the passage of any ordinary vehicle. The streets deserve the name of lanes, and are paved either with bricks or with small stones set in patterns after the fashion of our tiled floors. The stories so rife about mosaic pavements in Broek, like many other tales of a similar character, have no foundation in fact. Every thing, however, shows neatness in the greatest excess. All the walks and by-ways are strewn with sand, or shells arranged in exact and regular form; while the houses, mostly of wood, are painted in bright colors, chiefly white and green. The roofs are covered with polished tiles of different hues, which, with the apparently ever-fresh paint of the other parts of the buildings, reflect so much light, when the sun shines, as to dazzle and pain the eye.

The dwellings of the poor are, as usual, of one story and extremely plain; but the abodes of the rich are of a style not to be

HUMAN DRAUGHT-HORSES.

described by any ordinary terms of architecture. The Dutch idea of form and proportion must either be entirely deranged, or so fantastic as to be incapable of any other expression than the grotesque. The Broek houses are, on the whole, the absurdest I have seen. They look as if Grecian temples, Chinese pagodas, Saracenic palaces, Italian villas, Eastern mosques, and Persian bazars had had a common ague fit, and, after shaking themselves to pieces, had gathered up the fragments lying nearest, and, reconstructed in the most miscellaneous and chaotic fashion, had had the assurance to call themselves houses. Such are the habitations of Broek, illustrating a latent comic element in their occupants which they themselves never suspect. So far from this, they believe in all seriousness their homes perfectly charming, and can not admire them enough. The omnipresent canal exhales its fragrance under the windows of these whimsical retreats, which are frequently approached by rudely improvised bridges over the stagnant water. The front-doors are usually barred, and the shutters to the lower windows tightly closed, as if the inmates were prepared to stand a siege. If they were trying to keep out the odors pervading the entire kingdom, their caution would be natural enough; but they so delight in and are so accustomed to unsavory smells they could not, I believe, retain their health in a perfectly pure atmosphere.

The Prussians have named one of their towns Frankfort-on-the-Oder. The Dutch

ENTERING A HOUSE IN BROEK.

might add "on the Od(o)r" to any of their cities or villages with the fullest propriety, for the entire kingdom is on the odor in the highest and strongest degree.

Singular as is the outside of the Broek houses, the inside is still more singular; and I was resolved not to go away without inspecting one of these quaint interiors. I should have been glad to enter one of the larger and more pretentious dwellings; but not wishing to ask for such an impertinent privilege, I satisfied myself with a residence of the humbler sort. The front-door, as is the custom there, was not to be invaded—it is never opened except at a marriage, funeral, christening, or on some other important occasion—so I went round to the side-door, where several children, nearly all of the same size, laid down a wet cloth that I might wipe my feet upon it before entering. The general habit there is the Turkish one of removing the boots or shoes at the door, and walking in either in stockings or in the slippers or sabots always conveniently at hand.

At almost every door in the village I had observed these pedal relays, not to use which would be regarded not only as a gross breach of decorum, but an inexcusable offense against neatness. Even the Czar Alexander, it is said, was obliged, when he visited Broek, to conform to this ridiculous usage.

The floor of the dwelling was of Dutch tiles regularly set, and the walls of deal boards, clean as any dining-table, and highly polished from constant scrub-

bing and rubbing. Every article of furniture, every utensil or vessel for culinary or other purpose, was without speck or spot. Not a thing was out of place, and the precision and order of the household were so conspicuous and rigid as to be positively oppressive. Each house has at least one apartment seldom opened or entered, which is forbidden generally to all the members of the family except the housewife. She enters this sanctum once a week, unfastens and opens the shutters, takes down all the china deposited on tiers of shelves, carefully rubs it, scours the walls and floor, polishes the stoves, and scrubs the furniture till she can see her face reflected all around her. Then she shuts up the apartment again until another week demands her toilsome and conscientious service.

Examining several of the stables in the village, I found them as faultlessly neat as the human habitations. In these the cows are kept, out of whose milk admirable butter and the Edam cheese are made. During the summer the cattle graze in the fields, but during the cold weather they remain in the stables. From one end to the other runs a gutter, above which and over each stall I observed a hook fastened to the ceiling. I suspected the object of this, and inquiry confirmed my conjecture, that the hook was used to tie up the tails of the cattle to prevent their dragging in the dirt and soiling their cleanly coats. Neither the peasantry of any other country of Europe nor the poor people of America live in the midst of any such neatness as the Dutch cattle.

I entered some of the dairies, and saw butter and cheese in different stages of preparation. That in press, soaking in water, and undergoing the salting process, was alike equally clean. The makers are so squeamish they seldom touch butter or cheese with bare hands, lest manual contact impart to it a shadow of sully.

A STABLE IN BROEK.

One of the largest gardens of one of the most conspicuous houses in Broek is accessible, and is shown to all strangers, who are expected to remember the custodian in a financial way. This garden is unmistakably a curiosity. It is ten times more artificial than Isola Bella, or the grounds of the Pallavicini Villa, near Genoa, but very different in its artificiality. Such a collection and confusion of bridges, grottoes, arbors, summer-houses, rustic retreats, and pavilions, pagodas and temples, has rarely been made. It out-Broeks Broek. Various queer contrivances and designs confronted me wherever I turned. The ponds are full of ducks, swans, dolphins, naiads, and mermaids made of wood or pasteboard, and painted in bright colors. Some of the arbors and miniature temples contain figures large as, and made to represent, men and women, who (or which) by ingenious machinery smoke pipes, drink beer, gesticulate, go through military evolutions, and even sing, though candor compels me to confess that the voices I heard were not quite natural, and considerably out of tune.

I asked my chaperon the names of the songs and the language in which they were sung, as I failed to recognize either. He informed me that one of the puppets executed a national hymn, and another a popular love-song of Van Hooft. No doubt he was sincere (I should never accuse a Hollander of the slightest intention to jest); but I am confident that a national hymn or a love-song, rendered precisely in that way, would never rouse the Dutch to heroic deeds, or melt the heart of the most amatory swain. The singing of those lay figures may as well be acknowledged a failure. The sounds they emitted brought to mind the droning of a spinning-wheel, the grinding of a coffee-mill, the wheezing of an asthmatic engine, and the broken wail of a suffocating infant, all combined in one series of discordant notes.

Some of the residents of Broek, I have been told, go so far as to paint the smooth ends of the kindling-wood which they store in their outhouses for future use. I have even heard that the most rigid of the Calvinistic families have two handles to their pumps, one for what they call week-days, and the other for the Sabbath, believing, in their conscientious narrow-mindedness, that to use one handle all the time would violate the strict meaning of the Scriptures.

Clearly, Broek and its inhabitants are foolish and perverted enough without any such additions to their large stock of absurdity. They do not, however, as many suppose, typify Holland or the Hollanders. In the large cities they are thought ridiculous extremists, and their regulations and customs would not and could not be kept up, except in a small village whose people have a mistaken pride

in adhering to antecedents, and treading in the narrow circle of their forefathers. The Broekites are simply lunatics on the subject of washing, scrubbing, and rubbing. They have no mind for any thing else. Soap and water is their deity, and they worship it most zealously. Household hydropathists they will be likely to remain until Amsterdam closes around them, and takes the nonsense out of their much-muddled brains.

Touching the reputation of the Hollanders for cleanliness, I must say that travel and attentive observation in that country have taught me that it is very materially overrated. Their cleanliness is excessive and preposterous in one direction, but defective and inadequate in another. Their passion for neatness extends almost altogether to external objects—to their houses, shops, gardens, and whatever implements or instruments they have constant need of. It does not satisfy any instinct of purity, or answer to any chastity of feeling. It is based on a certain necessity, and springs from a compulsory economy and the acquired thrift of the people. The climate of Holland is always damp, and its atmosphere precipitates soot and dirt of every kind; dampness and dirt make mould, decay, and waste. The Dutch, conscious of this, are forced, by the need of saving their stivers, to remove dirt and arrest pervading dampness wherever found. Consequently they must rub and scrub during the greater part of their natural existence to preserve themselves from monetary loss. With their earliest years they begin this battle against dampness and dirt, and the struggle lasts to the grave. What was an obligation soon becomes a habit, and the habit in due time becomes a tyranny. Every spot or speck or soil presents itself to them as something imperiling their earnings or their income; and so they attack it with the same spirit and energy with which they resisted the encroachments and exactions of Alva's armies.

To personal tidiness the Hollanders of the lower class are wholly indifferent. Their cottages and farm-houses will be models of order and cleanliness, while they themselves will be the opposite. They are by no means infatuated in respect to bathing or frequent change of linen, even when they might be pure and sweet without any actual expense. Those who are independent in circumstances, or who have made comfortable fortunes, very frequently fail to carry their notions of neatness into their privacy and personality. Physically and in their attire they can hardly claim precedence of the Latin nations, and are unequivocally inferior in this respect to the English and the Americans. There is no association or stimulus of economy with daily bathing and fresh linen; and so they are free from ecstasies in that regard.

He would be a bold man who should charge the Dutch with any special delicacy of taste or appetite. Their food is often of the coarsest and strongest. They are fond of dishes we could not touch, and they dwell in atmospheres that would stifle us. Their cheese is potent beyond calculation, their pipes so ancient and puissant that no other mouth could hold them, and their stews and pickles too aromatic for common palate or ordinary digestion. At Rotterdam, Amsterdam, Leyden, Gorkum, Nimeguen, in fact, at every city and town I have visited, I have noticed practices and habits among the people which were positively repulsive. Again and again I have seen women washing fish and culinary vessels in the stagnant and noisome ditches and canals, and have been surprised to perceive these ablutions going on with the paddling of feet and throwing of offal in a most unpleasantly contiguous neighborhood.

One cause of the wide-spread fame of the Dutch for neatness is that they were neat before other nations in Europe had become so. Their habits of cleanliness are nearly the same now that they were generations since, while the remainder of the Old World people have greatly improved therein. Their fame has remained in spite of many reasons for their not deserving it, and the public has accepted what originally rested on very substantial grounds. Comparatively few travelers go to Holland, and still fewer see with their own eyes. Therefore, be the departures of the Dutch from universal cleanliness what they may, their reputation for it will continue to be proverbial through generations yet to come.

It has occurred to me sometimes that most tourists enter the towns of Holland early of a Saturday morning, when a most extraordinary cleaning (*schoonmaking*) invariably takes place. Then the front of every dwelling presents a most active scene. Scrubbing, scraping, brushing, rubbing, and mopping are pursued with superhuman energy by at least half a dozen persons on the steps, at the windows, on the sidewalks, and in the gutter. Hands, brooms, and mops are deemed insufficient, and small hose are employed (we have borrowed these from Holland) to deluge the dwelling and the entire neighborhood, including every passer-by.

Having had the misfortune to be abroad at a very unseemly hour on several Saturday mornings, I was so often splashed and wet by preoccupied servants and frenzied housewives, incurred such imminent risk of having my eyes put out by broom-handles, and of being knocked down with dripping mops, that I registered a solemn oath, in a blank leaf of Balzac, that I would never more set foot out-of-doors in Holland on Saturday morning until after ten o'clock.

Zaandam is one of the attractions in the vicinity of Amsterdam. In going there I

retraced most of my steps from Broek to Buiksloot, whence the road runs along the ridge of a vast dike, following the indentations of the shore, and keeping out the sea from a region already excellently supplied with water by reason of its numerous canals.

Zaandam, at the junction of the little river Zaan with the IJ, is remarkable for its wind-mills, of which it has some four hundred, many of them of gigantic size. They are very efficient in various ways—grinding corn, pumping up water for drainage, sawing timber, converting tobacco into snuff, crushing rape-seed into oil, pulverizing sandstone for floors, and powdering trass. Trass is a soft rock-stone brought from the borders of the Rhine near Andernach, and when finely ground, and mixed with sand and lime, furnishes an invaluable cement for constructing locks, sluices, and dikes, because it has the property of hardening under water.

To the dikes Holland owes its existence. They are immense ramparts of earth and stone raised all along the coast, and sufficiently strong to prevent the sea from forcing its way through them, and high enough to defy inundation. They are also required to restrain the channels of the rivers, which are nearly as perilous to the kingdom as the ocean itself. The first thing necessary to the dikes is a solid foundation, obtained by ramming down the soil, and by laying a substratum of clay, or, when that is not possible, by driving piles. The dike is formed of such earth as will cohere most readily, and its face is protected by the interweaving of willow twigs, whose interstices are filled with puddled clay. This wicker-work, being renewed every three or four years, makes such an active demand for willow boughs that the trees are extensively cultivated in Holland for that purpose. Not infrequently the dikes are planted with trees, because their spreading roots aid greatly in holding the earth together. Sometimes their base is faced with masonry, and strengthened by huge heaps of stones brought from other countries, while the upper part of the dikes, rising in some places as high as forty feet, is thickly covered with turf. The vastest of these artificial protections are at the Helder, and at the western end of the island of Walcheren. The annual expense of keeping in repair each of those stupendous dikes is not less than 90,000 guilders—about \$36,000 of our money; and taking care of all the dikes of the kingdom and regulating the water levels cost from 6,000,000 to 8,000,000 guilders—\$2,400,000 to \$3,200,000. A special corps of engineers (*waterstaat*), numbering many men of science, receive regular salaries for guarding the country from all danger of inundation. During the winter, when great storms are common, these engineers are stationed at the points where an irruption of

the waters is most to be feared, and ample supplies are at hand to resist old Neptune in case of need. Watchmen are posted day and night along the line threatened with attack to give instantaneous warning of approaching peril, and to summon from the neighboring villages workmen appointed by the authorities to the scene of danger. The rising tide at such times is watched with intense anxiety; and when the calamity is anticipated an alarm-bell is rung, and every man hurries to his duty. If the sea still rises, a new rampart is built on the top of the dike, and so rapidly that the water is almost always kept out. Should the strength of the dike be doubted, or a breach be made, sheets of sail-cloth or mats of rushes are placed on the outside to resist the action of the sea. In the event of all these precautions failing, a semicircular rampart is thrown up behind that part of the sea-wall which has shown signs of weakness, thus presenting an inner barrier to the remorseless foe. There have been numerous instances in which all these efforts have been ineffectual, and entire districts have been overwhelmed and lost, with thousands of lives, in the great rivers or in the ocean. What is now the Zuyder-Zee was dry land up to the thirteenth century, and the Gulf of Dollart, in the province of Groningen, was made in 1277 by an inundation which destroyed not less than forty-five villages. The average height of the Holland dikes is about thirty feet, and their breadth at the base seventy feet, with room enough at the top for a roadway. Their total cost is estimated at \$1,700,000,000.

Zaandam is noted for the cottage in which Peter the Great of Russia resided in 1696, while working as a common mechanic in the ship-yards of Mynheer Calf, that he might instruct his subjects in the art of building vessels. The name he bore there was Pieter Bass. He is said to have been very popular with his fellow-laborers, because he wore the same common dress with themselves, and associated with them on the most democratic terms. When the Duke of Marlborough went there to see Peter, he could not distinguish the czar from any of the other mechanics, and Peter, as the story goes, was too much interested in his work to pay any attention to or even notice the duke.

The imperial cottage, which is of rough planks, and very far from straight on one side (whether from the giving way of the

DOOR-WAY OF PETER'S HOUSE.

foundation, or out of compliment to the buildings in Amsterdam, I am not prepared to say), is carefully preserved there, and shown to every visitor. It has only two small rooms, and in one of them is Peter's bed, which closes in front with drawers, and bears a very striking resemblance to a cupboard. The czar was an original and a humorist, otherwise I could never be induced to believe he slept in such a thing, which reminds me more of an extemporized corn crib in the far West than the couch of an emperor. The walls of the small apartments are as thickly covered with names, cut with knives and in ink and pencil, as the walls of Shakspeare's house at Stratford, or the very questionable prison of Tasso at Ferrara. Above is a loft, only to be reached by a ladder, up which, I imagine, Peter climbed for exercise when he found that old corn-crib cupboard too luxurious a resting-place. This venerable relic, as it is styled, has been inclosed in a case, which can be covered with shutters to protect it from the weather. If I owned Peter's cottage, I think I should tow it out to the Zuyder-Zee and sink it; but as it is one of the sights of Zaandam, and brings in a number of guilders a year, it will remain there until it crumbles to decay. And when it does, I suppose some enterprising Dutchman will construct a new cottage, make it look ancient, and continue to draw upon the purse-strings of the curious. A marble tablet is let into the wall, with these words engraved thereon:

"PETRO MAGNO—ALEXANDER."

Whether the Emperor Alexander, who caused the tablet to be placed there with the inscription, thought that Peter's name added honor to his, or his name added honor to Peter's, can hardly be determined; but as

"Alexander" is in larger letters than "Petro Magno," it is fair to presume he held the latter opinion.

The general belief is that Peter the Great passed a number of months at Zaandam; and though I do not like to destroy illusions, the integrity of history forces me to state that he remained there only three days. He was so much annoyed by the crowds who came to stare at him that he went to Amsterdam, and served his apprenticeship in comparative privacy within the walls of the dock-yard of the East India Company.

While you are at Zaandam, you should go to the Otter and get a fish dinner. That inn has as much reputation in Amsterdam for its piscatorial specialty as the Ship, at Greenwich, has in London. If you do not preserve a grateful memory of the excellence of the fish, you will probably retain, as others do, some recollection of the extravagance of the price.

The pauper colonies of Frederiksoord contain much that is interesting both to the philanthropic and the students of political economy. They are about three miles from the little town of Steenwyk, and were established by the Society of Charity (*Maatschappij van Weldadigheid*) at the Hague. The ground belonging to the colony is principally situated in Drenthe, but lies between that province and the provinces of Overijssel and Friesland. The establishment has two divisions—a free colony of voluntary settlers and a colony for the suppression of vagrancy and mendicity. The Society, an association of private gentlemen of fortune, bought, in 1818, some thirteen hundred acres of barren land, producing nothing save heath and turf, for the purpose of trying a philanthropic experiment. They settled upon this sterile soil a number of families who had long been beggars and paupers, and by inducing them to labor, and by managing them with great tact and skill, have made the land yield support to its tillers. That the colonists might have communication with the sea and other parts of the country, the little river *As* was rendered navigable.

I had been informed that the experiment had proved a lamentable failure, and I was therefore agreeably surprised to find the colonists comfortably lodged in houses built of bricks burned from the clay dug on the spot, and laid with mortar made from lime out of shells brought from the sea-shore, and burned with turf procured from the immediate neighborhood. And all this work has been done by themselves. The settlers, having nothing of their own, were fed, clothed, and furnished with such implements as they needed during the first year. The means so expended were gradually repaid; and for thirty-five years nearly all the colonists have supported themselves, and some of them have laid by considerable money. Upon inquiry I learned

that a portion of land is given to each person (or family) on arrival. This he is to cultivate, and his labor and management are carefully supervised. Those who are unwilling to work are compelled to do so; for one of the first rules of the settlement is that nobody shall be idle. As many of the settlers come from cities, and are consequently ignorant of agriculture, they receive daily instruction until they are fully acquainted with whatever is needful for them to learn. The children are sent to schools established there, and for which teachers are procured by the Society; while the women are set to spinning, weaving, and sewing. Every body is kept busy, and at the close of each day's work the laborer receives a card with a statement of his earnings, for which he gets an equivalent in food and clothing out of the public stores. Whatever he earns above his daily necessities and his obligations to the Society belongs to him personally. Though each and all are under severe discipline, and subject to strict rules, they are fully at liberty to leave the colony if they like, after the annual harvest has been gathered. Those who stay, and prove to be steady, industrious, and trustworthy, have the land they cultivate placed at their own disposal, occupying toward the Society the position of tenants as soon as they have discharged their indebtedness.

Within the last ten years the colony has enjoyed more prosperity than at any time since its organization. All the travelers who have gone to Frederiksoord seem to have been agreeably disappointed, as I was, in the health and contentment of the people, and their generally flourishing condition. The paupers were certainly an almost hopeless class; for a Dutchman unwilling and determined not to work is far more indolent, and, as we should say, demoralized, than the representative of any other civilized nation. He inherits an industrious temperament; the atmosphere he breathes impels to labor; all his surroundings are constant rebukes to inactivity. The founders of the benevolent enterprise had the gravest doubts of its success, and the improvident men and women sent from the cities to Frederiksoord appeared to be of the lazily courageous kind who would rather die than work. When they were placed, however, in their new situation, and environed by new social agencies, they underwent a most favorable change. Not a few of them, after twelve months' experience, returned to their old vagabondage; but by far the larger part remained, and were greatly benefited; while many have really prospered, and could not be induced to quit the settlement. From not having a stiver, and from being wholly dependent upon alms, they have grown into large self-respect and proper pride through their remarkable reformation.

The crops, as I was informed, had for several seasons past been large and remunerative. The residences of many of the colonists are inclosed with neat though small gardens of fruit and flowers, to which attention is given during leisure hours. Their houses are tidy and comfortable, their food wholesome and abundant, and their raiment neat and well adapted to the season and the nature of their labor. The effect of good and plentiful diet and of desirable surroundings is there shown to have improved very perceptibly not only the mental and moral, but the physical man. Those who have been members of the community for fifteen or twenty, or even ten years, I was told, looked altogether unlike the men and women they were on their arrival; and the children born in the colony clearly illustrate the theory of advancement under favorable conditions.

There are at present, I believe, some fifteen hundred persons in all—men, women, and children—at Frederiksoord. There have been, I understood, many more, and I have heard the number estimated as high as three thousand; but the former figures, so far as I can learn, are nearly if not quite correct. The expenses of the colony are necessarily very large, but they are, I am told, fully defrayed by its income. Some years, when the crops fail to turn out well, the revenue declines, and is not enough to meet the obligations of the Society, but on an average it proves sufficient. Whether the undertaking has “paid,” considered merely in the light of a financial investment or a commercial speculation, I was unable to learn to my complete satisfaction. Some persons in Amsterdam declared it had, and others at the Hague asserted that it had not; but, judging from observation and from all sources at hand, I am of opinion that it must yield at the present time a fair percentage on the invested capital. The colony can hardly be considered any longer an experiment, having been established more than half a century. It has attracted wide attention, and elicited much interest in Holland—so much that the government, more than thirty years since, sent commissioners to Frederiksoord to investigate the plan of operations. After remaining there several weeks, and making themselves fully acquainted with all the details, they returned with a highly favorable report. This induced the large Dutch cities to transfer to the colony all the able-bodied inmates of the work-houses, the cities paying for their maintenance until they became self-supporting.

The founder of the colony was General Van der Bosch, who died some thirty-five years ago. While serving his country in the East he bought an estate in Java, with the intention of applying to it all the then known improvements in agriculture. He

did not succeed at first according to his expectations; but discovering that a native and neighboring planter produced splendid crops, he acquainted himself with the system of the latter, and profited greatly thereby. This system consisted in the main in carefully and richly manuring the land, and cultivating it almost entirely with the spade and hoe instead of the plow. He introduced this plan into Europe, and practiced it at Frederiksoord (it is now general in Holland) with such success as we have seen. The soil there was extremely poor, but fifty years of hard labor and intelligent cultivation have supplied most of the short-comings of nature.

In wandering over Holland, as I have done, on foot, in trekschuits, and by rail, one is vividly impressed with many of the peculiar customs of the country and habits of the people. He deems them remarkable, and often absurd, merely because they differ from those he has been familiar with. What the Dutch do to-day we did, at least in part, a century or two since. Walking or driving through the streets of Arnheim, Utrecht, Alkmaar, or Haarlem, I have imagined myself on the island of Manhattan two hundred and thirty years ago, when the Dutch governors, instead of Tammany, ruled the city. What a blissful time that must have been when Peter Minuits bought this entire island from the Indians for twenty-four dollars, and no doubt thought it a high price too!

I have frequently seen oleaginous tradesmen and plethoric burghers drinking their beer and smoking their pipes in Holland in front of their shops or on the borders of a canal, who might have been friends of Wouter Van Twiller, and the immediate ancestors of the Van Rensselaers, Schermerhorns, Van Schaicks, and Van Runkels. To push back time for two centuries, and to have their early history reproduced, natives of Manhattan should journey in the Netherlands.

The Dutchwoman still uses the small stove (*vuurstoof*) which our mothers and grandmothers were wont to carry to church. The stove is a square box, open on one side to admit a pan filled with hot embers, and perforated at the top, so that the heat emitted will warm the feet. It is her inseparable companion, without regard to weather, not only at home, but is borne by or after her to the church, the theatre, or the houses of her friends. She employs it as a footstool, concealing it under her gown; and its perpetual presence has given rise to the indelicate fable concerning the sooterkin, of which Swift and Butler have made such lavish use.

Sickness in a house is signified by a paper fastened upon the door, with the physician's daily statement of the sick person's health, which prevents the need of knocking or

DUTCHWOMAN CARRYING STOVE.

ringing to inquire after the patient's condition. In some of the towns of North Holland, where or whenever the feminine head of the household has become a mother, this paper is bordered with lace, and the great frequency of births in that, as in every other province, brings lace into active demand. The appearance of an infant in that land, so prolific of large families, is regarded by all the relatives and friends as a very joyous event. Any dwelling which a little stranger has thus mysteriously entered possesses, by an old law and by long custom, peculiar privileges and immunities. The residence to which a son or daughter has been added no outward disturbance is permitted to trouble for a fortnight. It is secure from legal executions, from duns and bailiffs; and soldiers, even in time of war, can not be quartered on the premises. All persons passing the house move lightly, and processions with bands of music interrupt their playing until they have gone by.

The *Aanspreeker*, as he is styled, can still be met in Holland, though he is disappearing before the steadily growing homogeneity of national customs. This person is regularly and professionally employed to announce the death of any member of a family to the friends, kinsmen, and acquaintances of the deceased. To symbolize his lugubrious office, he is clad in deep black, wears a shocking-looking wig, a superannuated cocked hat, covered with flowing crape, and frequently a short cloak. To me there is something very droll about this ambulatory obituary character. He always suggests the Mantuan apothecary, when well made up, in "*Romeo and Juliet*." The poor devil looks nearly as shabby, and quite as woe-begone; and I was under the belief that familiarity with his melancholy calling had eclipsed any cheerfulness of spirit he might originally have had, until I observed him on several occasions, out of his masquerade, imbibing beer, and laughing im-

moderately over a Dutch journal designed to be humorous. Then I knew his sorrow, like his inky cloak, must be professional; that he must be a genuine Mark Tapley, who would indulge in guffaws at his mother's funeral, provided he had not been engaged to convey the mournful intelligence to the other members of the family.

A custom prevalent, I understand, in Gotham, something more than thirty years ago, is still followed in many of the cities of Holland—that of the night watchmen winding their rattles, and making such an infernal noise strangers are very likely to be awakened with the drowsy fancy that Philip II.'s savage soldiers have risen from their graves, and are fighting their battles over again. Here the guardians of the peace used their rattles to call their brother minions of the moon to their aid; but there they create the racket to warn all thieves and robbers to fly before their lawful approach. This unique method suggests Dogberry at once; and, indeed, I have never seen a human creature off the stage who appeared so much like Dogberry as the Dutch watchman. He looks the character to perfection, with his heavy figure and protuberant abdomen, his dull eye and his solemn inanity of face. I am convinced, albeit we have no evidence that the poet was ever on the Continent, that Shakspeare must have seen a Holland watchman before he drew his incomparable oaf of Messina. There is too much fidelity to the original in the copy of the momentous old blockhead to make any other hypothesis plausible.

THE AANSPREEKER.

Lounging one evening through the Cingel, I encountered and accosted a veritable Dogberry, in order to persuade him to repeat in his vernacular: "Write down—that they hope they serve God: and write God first; for God defend but God should go before such villains!" etc.

My success was not brilliant, partially from the fact that the harmless idiot could not understand a word of English; nor could he comprehend my classic Leyden Dutch. He made, however, numerous heroic attempts to render the quotation to the best of his ability; and I really fancy that the gibberish he uttered was more expressive of the interior meaning of the bard than the exact language of the play. The unfortunate simpleton was so anxious to deliver the speech that his violent efforts resulted in his falling into the canal. I left him there; knowing he was too corpulent to sink, and too dull to drown.

The first time I visited Leyden was from the Hague. The road is unusually pleasant for Holland, passing, as it does, a number of the châteaux of the nobility, and many country houses and gardens with their winding walks, fantastic bowers, stiffly cut hedges, and prim-looking beds of dahlias, hyacinths, and tulips, of which the Dutch are so extravagantly fond. The undulations of the surface of the soil show that the neighborhood is largely composed of dunes—sand hills one to three miles in breadth, and often forty or fifty feet high, formed by the blowing up of the sand from the sea-shore.

On the coast the dunes are mere loose sand heaps (driven here and there by every blast), which, moving on year after year, would cover the country, were they not restrained by artificial means. The loftiest dunes are at Camperdown, memorable for its naval battle, where the sand has reached an altitude of nearly sixty feet. To prevent the scattering of the sand and the inland progress of the dunes, they are sowed annually with reed-grass, whose roots spread so rapidly as to hold the sand together, covering the surface in a short time with a singular species of vegetation. This growth and decay form, before long, a layer of earth, on which good potatoes, and even plantations of firs, are raised.

Thus it is that the Dutch always turn the natural enemies of their prosperity and development to their own signal advantage.

Leyden is on that branch of the Rhine which alone retains its name as far as the North Sea. The branch has the semblance there of a broad canal, for which, indeed, I at first mistook it. I had considerable curiosity to see the mouth of the Rhine, and so went to Katwyk (eight miles from the city), where the mouth of the celebrated river is presumed to be. The mouth remained closed from the beginning of the

ninth century until 1809, when the present sluices were made. Left to itself, the river was lost, before it reached the ocean, in the great beds of sand which obstructed it, and which were either below tide-water, or were so flat that a sluggish stream could not pass through them. With such obstacles, very little, if any, of the Rhine found its way out, but formed into great stagnant pools, and spread over the entire region in a miasmatic morass. To remedy all this, and to make a new outlet to the Haarlemmer Meer, a wide artificial channel was cut, provided with a triple set of sluices having thirteen pairs of gates. When the tide flows the gates are closed to shut out the sea; and when it ebbs they are opened by machinery to give their accumulated waters an opportunity to run back and wash away the sand collected on the outside by the waves. The volume of water passing out is estimated at one hundred thousand cubic feet per second. In spite of the enormous dikes at the entrance of the canals and on the sea-shore, and the size, strength, and ingenious contrivance of the flood-gates, the (merely nominal) emptying of the Rhine into the ocean, which I had fancied would be very interesting, proved a sad disappointment. As Sir Charles Coldstream says, "There is nothing in it."

Leyden, which at one time had a population of nearly one hundred thousand, has now less than forty thousand. It is a quiet, sleepy, university town—a sort of Dutch Oxford—and, like most of the cities of Holland, is intersected by canals, studded with windmills, surrounded by gardens, country-seats, and fertile meadows. Breede Straat is considered a wonderful street by the Hollanders, who do not hesitate to declare it the most beautiful in Europe. The Town-hall, in that thoroughfare, is a quaint and picturesque old building, whose lower story is occupied by butchers' stalls. The ancient castle De Burg, a very noticeable structure, is now an inn, and the grounds about it are converted into tea-gardens—a favorite resort both with the citizens and with strangers. In the Council Chambers of the Town-hall, among other pictures, is a portrait of the heroic and historic burgomaster, Pieter Adrianzoon Van der Werf. For nearly four months he held the city against the Spaniards; and when the starving garrison demanded that he should surrender, he replied: "I have sworn to defend the town; and, by God's help, I will keep my oath. Bread I have none; but if my body will sustain you, tear it to pieces, and let the hungriest devour it first." These brave words and his noble devotion shamed the clamorous and roused the faint-hearted. Leyden resisted until the flotilla of provision-laden boats, sent by the Prince of Orange, who had, some time before, cut the dikes of the Maas and Yssel, were carried by a tremendous and almost miraculous

storm to the gates of the famishing city. The Spaniards were drowned by the swelling tides in great numbers, and in a desperate engagement by land and water were finally driven from their palisades and intrenchments, and a glorious and immortal victory was secured to the gallant Dutch.

The palmy days of the university are no more; but it still ranks high as a seat of learning, and its Museum of Natural History is one of the richest and largest in Europe.

I like Leyden for its quaintness and quietness, as I do other cities and towns of Hol-

land, though I should deem it a misfortune to be compelled to live in any one of them. The entire country is so original and entirely unique that to travel through it fills the eye with strange pictures, and furnishes the mind with new ideas. Marvell, Goldsmith, and Beckford may ridicule it, and Voltaire may scoff at it in such parting words as "Adieu, canaux, canards, canaille;" but no one who becomes acquainted with Holland or the Hollanders can fail to admire a land so nobly gained and so bravely retained, or a people so determined and heroic, so conscientious and so true.

A GOOD INVESTMENT.

CHAPTER VII.

A LITTLE later—it was in the early days of May—a steamboat stopped at "Damarin's Landing," just after dawn, to put on shore a passenger; and the long hoped for pet and pride of the family was received into the arms of his mother, father, and sister.

The wonderful transformation which youths undergo in a collegiate course of learning and dissipation has been a common theme for novelists, though the plowboy-poet says they only

"Gang in stirks and come out asses;

but here was a change worthy to be contemplated. Four years before, the subject of it had left Stone House as much of a plowboy as Burns himself, with only a good school education and only farm-house manners. He returned, at the age of twenty-four, with every aspect of a thorough-bred soldier, used to command, and tutored in self-reliance and self-respect. He had seen something, too, of the social world, and though he could not claim the polite distinction of being a man of the world, was yet very far from being the boy of the farm he was when, at the fall of Sumter, he buckled to his side the first sword he had ever beheld in his life. His face was decidedly handsome, with large blue eyes, a Roman nose, a mouth whose well-defined shape the full wavy beard he wore could not hide, dark chestnut hair, and a complexion naturally fair.

Tall, full chested, well proportioned, and well jointed, he was of that Northwestern pattern of man upon which nature, working under free conditions and on a virginal soil, has modeled ten millions of people, who sufficiently prove that the human race need not degenerate in America. Men of such a type can never be clownish, nor can any thing short of positively bad bringing up render one of them awkward. Having no idea of social inequality among neighbors, their manners are based on a sense of justice, and

like the maple and walnut trees of their forests, though rough in bark, they are fine in grain, and capable of receiving any degree of polish.

When Bella, hearing of the arrival, rose and dressed herself to go down and do obeisance to her captor, she made her little toilet with some care; for to say that she was indifferent to the impression she would make on him were to say what has never been true of any female captive since Cleopatra captivated Cæsar.

But, for all that, she hated him—persistently, and on principle—and conceived her duty to South Carolina also required of her to despise him and his family for their low birth and inferior breeding, though her own superior breeding taught her to keep this last sentiment to herself. She was glad he was come, for now she hoped to be allowed to go directly to her home, and yet dreaded the awkwardness of meeting him; and for that reason did not make her appearance until all the family were seated at breakfast. He rose, however, as soon as she entered the room—rose like a real gentleman, as it struck her—and went and took her hand as if it were that of an old friend, though he had evident difficulty to restrain a smile at her excessive dignity and reserve. There was no going to school that day for Polly, and one girl never went without the other. But Bella could bear no part in the family holiday, so wandered into the garden, and through it into the old orchard on the river's bank, where, seating herself on the canoe-bench that has been named, she flung off the sun-bonnet which her head was becoming too hot to bear, and remained moodily regarding the opposite Kentucky shore, while her thoughts, following the direction of her eyes, went southward too; but while her eyes lingered on the great hill-side, where the opening flowers of the rebud and dogwood flecked with pink and white the young green surface of awakening vegetation, her thoughts traveled far beyond, to the land

"AND SO REMAINED, SAYING NOT A WORD."

where the ilex and magnolia waited for no spring to renew their evergreen robes, to the land where violets and roses had bloomed months before, and to her home of long ago, made beautiful by them all. Southward, southward she looked for deliverance, and southward went her hopes, her prayers, and complaints. Where was her father, that he came not for his child? or her brothers, that they came not for their sister? And those in the house heard her calling aloud the names of her brothers, and hushed their conversation to listen and sympathize.

The general asked his sister to go to her friend; but Polly waited till the outcry ceased to be audible—for she well knew how Bella should be treated—and then went and sat down beside her, glided an arm round her waist, laid the drooping head against her own, and so remained, saying not a word.

A skiff, crossing from the Kentucky shore, and which the five-mile current had carried far down stream, now approached near enough to where the girls sat for the persons in it to be observed. The passenger who

was being ferried over was a young man of medium size, dressed in a Confederate uniform, from which the gilt cord and other insignia had been removed. His hat was slouched and somewhat torn, and his boots were of reddish cowhide, into the tops of which the pantaloons were tucked. As the boat touched land, the stranger, taking a small valise in his hand, stepped on shore, turned and looked about, asked a few questions of the boatman as the latter was rowing away, and then began to ascend the bank. But he did not take the path which would have led up to the house: he took a road which, sloping round into a ravine that came to the river some little distance to the right of the house, conducted by a wide circuit to the avenue behind it, and in that way to the highway beyond, the road in question being the public way to the ferry, of which Mr. Damarin was proprietor.

He had not gone many steps, however, when Bella, who had started to her feet and been watching him with increasing agitation from the moment he came near enough for

her to discern the color of his clothes, flew down the pathway, and flung herself on his breast, crying, "Brother! brother! brother!" and, as if unable to utter any other than that dear word, continued to repeat it in every possible intonation of affection and joy.

The brother—for such, indeed, he was—as soon as he could disengage himself so as to see her face, exclaimed, with equal delight, and greater surprise: "Bella! My God! is it you, safe and alive? My poor, sweet, dear little sister, alive and safe—and here?"

"I knew you would come for me, Charles," she said, with her arms still about him, and her cheek pressed to his shoulder. "I knew some of you would—you, or Edward, or father. And where are they? Where is father? Have they killed him, as they did mother?"

"You knew of mother's death, then? But—yes," he added, evasively, "Ned is well now. He was badly hurt twice; but he's well now."

"And father?" broke in Bella, impetuously.

He renewed his kisses, while thinking on what he should say; then resumed:

"Bella, my darling, you are a true Carolina girl, are you not? We of the South have got hardened in suffering and disaster, have we not? Tidings of death have been our daily news for so long—"

"When did he die?" said the girl, as, drawing away from her brother, she stood and regarded him with apparent calmness.

"Father soon followed mother," was the reply.

She remained for a few moments still as a statue, save for the violent heaving of her bosom, as if exerting a powerful will to master a powerful emotion. At length, flinging up her arms and eyes, and exclaiming, hoarsely, "An orphan!" she cast herself on the ground, and clutched her fingers deep into the sand. And there she lay, breathing heavily, but without uttering word or moan. Her brother would have raised her up, but while he stooped to do so, Polly, who had remained aloof till she saw Bella fall, and had then swiftly but quietly approached, laid a gentle hand on his arm, saying, as he turned toward her, "Please, Sir, let her be as she is; it's the best way to do when she has such a turn. We always leave her to herself. You are her brother, Sir?"

"I am, miss; and may I ask how my sister happened to find protection where they know how to treat her so kindly and considerately?"

And while Bella lay with her face to the earth, Polly told, in simple terms, the story the reader already knows, and told it with such effect that her listener, when it was done, realized how happy a refuge the orphan and exile had found—far better than she herself seemed to realize it.

"And we all love her," the farmer's daughter continued; "yes, indeed, every one of us; and now we shall be so glad you have come, for she did long for you so much. And you'll take her back to Multiflora, to her own beautiful, grand home she has told me all about. I know it's ever so much better than the one we have been able to give her here. And she'll be so happy to be with you all there; but"—and here the sobs came—"it will break our hearts to part with her. I'm sure it will mine."

And seating herself on the ground by her friend, she, contrary to her own prescription, put both arms about her waist and raised her up. Bella turned and stared at Polly as if she had never known her. After a little while, however, she appeared to come to herself, and approaching her burning lips to those of her comforter, kissed them; then looking in her eyes, found there the best medicine for her own tearless distress—namely, love and sympathy and weeping; and seated on the shore, they both wept together.

For many minutes Charles Johnston walked back and forth on the shore by the water's edge, with folded arms and fixed look, as if in anxious consultation with himself. Suddenly he stopped, as if he had decided what course to pursue, and, taking his valise in his hand, mounted by the path to the top of the bank, and opening the garden gate, approached the house. He was received at the door by Mr. Damarin, to whom he made himself known as Captain Johnston, of the Confederate army, and who invited him to enter the parlor, where he was presented to Mrs. Damarin and the general. Addressing himself more particularly to Mrs. Damarin, he proceeded to thank them all in the most appropriate manner for their goodness to his sister. "You have been a mother, madam," he concluded, "to an orphan girl—to a creature more needing protection than the most helpless infant; you have filled the part of the protector the most needed of all others; and may God Almighty bless you for it!" He then explained that himself and brother had just returned from the only visit to their home they had been able to make since the death of their father, in 1863.

"Your father is, then, no longer living?" interrupted Mr. Damarin.

"No, Sir; he died not far from here, as I will explain." The young man then went on to say that they had found the plantation in such a condition—its mills and barns burned, and the house at Multiflora stripped of every thing, even to books and papers, and occupied by about fifty of the late slaves—that nothing could be done to reclaim the property without a considerable capital, whereas they had none at all. He had therefore come to the North to search for the proceeds of the cargo of rice (which must have

sold for more than thirty thousand dollars in gold), and which he knew it was his father's intention to place in safe hands somewhere outside of the Confederacy, to remain as a resource in case of the very disaster that had occurred. It was at the time when Morgan's raid was being turned into a retreat that Mr. Johnston had surprised his son, who held command in the raiding forces, by joining them, and asking permission to accompany the march, which he expected would escort him safely through the Federal lines on his way home.

From this down to the time of his death, which took place on the day following, the exigencies of the movement had permitted little conversation between him and them. He was shot by a bush-whacker, and died soon after, without recovering consciousness. No paper or memorandum had been found to give any clew to the disposition made of the funds, and the only filament of one they possessed was the surname merely of a friend of their father with whom he had sometimes corresponded. His name was Richardson, and his residence was then, or formerly, in Chicago; he was a banker, they thought. The captain's brother, Major Edward Johnston, had come with him as far as the new oil-fields in West Virginia, where he had remained to look for employment.

Most appropriately to the story would have come a request for Bella to be permitted to remain where she was until her brother returned from his errand of search; but this was prevented by Mr. and Mrs. Damarin both speaking at once, and begging she might be left with them, not merely till then, but until such time as a better home could be provided for her elsewhere, to which he was only too glad to consent.

"Where are the girls?" exclaimed the general, rather abruptly. "Shall we not go, captain, and look them up?" And he led the way into the garden, where, walking slowly, and speaking in a low tone, he continued: "I know very well how hard the fortunes of war bear upon gentlemen of the Confederate service. You will need money, perhaps, to make your journey. How much shall I lend you?"

With some difficulty the Confederate was made to accept fifty dollars, acknowledging the favor in phrases intended to conceal how pressing was his need, but in tones that quite sufficiently revealed it.

At the further gate of the garden they were met by those whom they sought. Bella ran up to her brother with almost a smile and many kisses, and then entwining both her arms round one of his, asked, "And when shall we go back to dear old Multi-flora? To-day? Right now, shall we not? Oh yes, yes; this minute, this very minute!"

"Not immediately, my dear," was the reply. "It is important for us all I should

make a long journey first; and should I happen to fail in the business I go upon, it may be necessary for you to remain some little time longer with your excellent friends, to whom you already owe more than your utmost gratitude can ever repay. Mrs. and Mr. Damarin have most kindly invited me to leave you with them, and I have consented."

Bella, who had hardly waited for him to be done, here burst forth:

"Leave me here—in yon stone prison-house, where I have borne a bitter captivity of nearly three years' duration—where I have been able to endure life only because of my daily hope that you would come, beneath the triumphant banners of the South, and reclaim me by force, as by force I was captured—where I never prayed for your coming without uttering a curse longer than my prayer against your enemies and mine? And now—now that you come to me—come to your sister, with every badge of a soldier stripped from your coat, I think the least you can do is to lead quickly away the poor emancipated captive, and not conspire with her enemies to prolong her imprisonment—"

"Bella! Bella!" interrupted her brother, astonished and alarmed. "Do you forget peace has been proclaimed?"

"Peace!" she replied. "There can never be peace between us and them, except the peace of death. If they will only exterminate us all, we will promise to be quiet. Will you—will the men of the South consent to remain under subjugation, not to the cowardly Yankees, but the more cowardly negroes, whom they have raised up to insult and degrade us more effectually than they could do it themselves? No! Southerners will not submit! They will take to the swamps and the mountains, with arms in their hands, and fight while they live! Charles, if ever again you would have me call you brother, rally to the fastnesses nature has made as refuges for desperate men, and there raise anew the flag of the palmetto and rattlesnake, and this time let the ground they are painted on be black. Raise that flag, and I will go with you and carry it—I will, so help me God!"

Her brother, who seemed to have given up all thought of reasoning with the infuriate little wretch—who, by-the-way, looked furiously beautiful the while—let her run on at will; and the two soldiers listened and looked, the one with mingled admiration, amusement, and concern, the other with feelings of a sadder shade. When at length she paused from exhaustion, the brother quietly remarked, "Such talk as this, general, may be pleasant to indulge in as a parlor amusement. Southern women have been very fond of it, but Southern men—those who survive—have had enough of it. Bella!" he exclaimed, as she was beginning

afresh, "be done! Not another word! I'm ashamed of you; you, a lady born, the daughter of a South Carolina gentleman—how dare you requite the hospitality of this family, which you have so long enjoyed, with such vile nonsense, such vulgar rant as this?" As he said this he approached his face to hers with a severe expression, and looked sternly in her eye, as if it were that of a wild beast he would quell with a glance.

Bella quailed. Perhaps the emotions of the day had exhausted her nervous power; or maybe the idea of her language, which to her seemed magnificent, being thought nonsensical and, what was worse, vulgar, struck her with such astonishment as to arrest the flow of her wormwood and gall; or else it was because she had at length met her match, and her brother's terrible eye had done its work. But she was cowed—stood silent; astonished and alarmed, perhaps, but certainly sulky, until, for the second time since morning, that sedative water of heaven called tears descended to bless her.

"Brother," said Polly, approaching the general, "don't mind the poor thing's raving. She's half crazed with her troubles; she don't mean a bit of what she says—she don't indeed. She gets over it right away, and when she isn't angry you don't know how good and sweet she is!"

The general smiled, and merely remarked, aside to his sister, "It's well the fits don't last long, or she would be apt to die of them."

But the present fit, in its sulky stage at least, was not so quickly got over. It lasted a week or more. And though she now permitted her apologist to lead her into the house, yet no sooner had they entered it than she broke away, flew up to the chamber occupied by them both, and turned the key of the door against the swiftly pursuing Polly, as she did that of her heart against all entreaties for admission. And there she remained all day, except when, at the rather peremptory summons of Mrs. Damarin, she appeared for a minute to bid her brother a gloomy farewell as he was about to go on board the Cincinnati packet, which stopped at the landing on its way down the river about the middle of the afternoon.

At the twelve-o'clock dinner Captain Johnston was not a little surprised, considering the evidence of competence, if not wealth, he witnessed, to see the farm people make their appearance. The general, too, was surprised to find how much the same circumstance annoyed himself. But Robert Hagan was more affected than either when a timid glance up the table informed him Bella's seat was vacant. He never dared look that way more than once during a meal, but the knowledge that she was there was something to him—how much he could not reckon or imagine; but it was something.

CHAPTER VIII.

THE further northward the ex-Confederate traveled, the less respect was accorded him. Throughout the South, in Kentucky, and even in the lower portions of the Northern Border States, it is possible for one with clean person, good morals, and inoffensive deportment to go in threadbare jeans and battered hat and boots, and yet receive such tolerable degree of deference as will permit him to retain his own self-respect. But when such a one journeys into the more civilized regions of further North, and looks for even the least consideration at the hands of the bureaucracy of boats, trains, and hotels, he will find that not the front of Jove, nor the grace of D'Orsay, nor the air and port of a crown prince, can avail to save him from contempt. It wore terribly on the spirit of the young Carolinian, representing, as he did, a family sprung from baronial stock, and connected with the Alstons, Middletons, Haynes, and Hegers—accustomed to condemn and not be condemned—to find himself taken by the elbow and pushed about, addressed, and "snubbed," not by any means as if all men were equal, but as if, on the contrary, they were very unequal indeed, and he one of the most inconsiderable. He was not philosophic enough to find consolation in the thought that a gentleman disguised by misfortune can be discerned at first sight only by such as are themselves gentlemen, or connoisseurs of gentlemen; and he was galled to the very tissue of his nerves, and arrived at Chicago fuming with more hostility toward his late enemies than he had felt

even in the heat of warfare, and was half sorry it was impracticable to follow Bella's advice, and find refuge in Pedee swamps or Appalachian gorges from a vulgarity so brutal. Thus, when he set out next morning in pursuit of his father's correspondent, his condition was far from what should be that of one who goes about a difficult search. He was discouraged in advance.

From the City Directory he made a list of the addresses of persons of the name of Richardson, which, judging from the occupations affixed, might include the address of the Mr. Richardson he wanted to find; then set out to call upon them in turn. The first on the list was a pork merchant, a pleasant enough person, who received him kindly, being used to deal with hog-drovers, but who soon satisfied him he could not be the object of his search. The next visit was to an old grizzly lawyer, lately come to Chicago, who in reply to one question popped off a dozen, which explored the case to the bottom, and then in a few words showed clearly that he could not be the man. The next was a railroad secretary, who left his desk and approached the person who, from the outside of the office railing, requested the favor of a few words with, "Well, what's wanted?" and on the business being opened to him, returned again to his desk, saying, as he went, "I know nothing of any such person; you will have to look further." Another Richardson was evidently too young; while another still, who was absent from the city, was a Scotchman, and very old, and therefore could not be the person wanted. And so the last name on the list was reached, which was also that of the Richardson whom some of the others thought might be the depositary of the funds. He was a banker, which circumstance, and that of his initials sounding rather familiarly to Johnston's ear, led him to entertain something like a hope. But each of the three times he called at the office of the banker the latter was either absent or too busy to be seen, and a fourth attempt had to be deferred till evening, and made at his residence.

As early as seven o'clock Johnston was pulling the bell at the door of an elegant mansion, such as bankers are able to dwell in. Yes, Mr. Richardson was at home, and the flunky would learn if he could be seen, if the visitor would wait in the hall. Presently a man, sixty years old, of heavy aspect, with white hair but black eyebrows, came out of the parlor, and on hearing the name of Captain Johnston, of the late Confederate army, seemed rather surprised, though not displeased, and conducted him into a magnificent parlor, where he asked him to be seated. "Well," remarked the banker, as they sat down, at the same time surveying the visitor from head to foot, and smiling strangely, "I suppose you are pretty

effectually used up down South about these days?"

"Very much so," replied Johnston, whom something in the other's manner repelled, and made him resolve to go cautiously about his inquiries. "May I ask, Sir, if you ever corresponded with my father, Mr. James Johnston, of Georgetown District, South Carolina?"

"Johnston? Johnston?" repeated the banker. "When I was in the pork-packing business I used to deal with planters in all parts of the South, and I think I do remember making shipments to one of that name in South Carolina; but"—looking keenly at his questioner—"why do you want to know?"

"Another question, Sir, if you please: did you ever meet my father in person?"

"Very likely I have; but why do you ask?"

"Please permit me one single inquiry further: did he call upon you when he came to the North in 1863?"

"I don't think, my friend, you will make much further progress with me until I know your reasons for putting these questions."

This extreme caution made the young man feel sure he had found at last the depositary of the rice money, while at the same time that depositary, from some motives, good or bad, would be very slow to admit himself such.

"I had supposed, Sir," said Johnston, so much agitated as he felt himself nearing the hidden treasure he could hardly command his utterance, "that as the war was closed there would no longer be any occasion for further secrecy concerning the transactions between you and my father; but, in order that you may be frank with me, I will mention that my father is no longer living, and that I, as his representative, am come to ask you, if perfectly convenient, to give me a statement of the account he kept with you. I allude more particularly to the moneys he placed in your hands when he visited you in 1863."

"Hum!" grimly interjected the banker, his covetous under-lip pushing up and overlapping the upper one. "What did you say the amount was?"

"That, Sir," returned Johnston, feeling the importance of concealing that he had no proofs of the deposit, "depends on the price of gold at the time. I have not the memorandum in my pocket at this moment, but think the cargo must have sold for as much as thirty thousand dollars in specie; must it not?"

"Thirty thousand in specie," was repeated in the same tone; and a suspicious nose moved downward to meet the covetous lip. "And if your father had placed that sum with me, do you know what I would have done with it?" Here the eyes snapped out sparks of fire. "I would have had it confiscated before the sun went down! Thirty thousand dollars is less than a third of what

your Southern gentlemen swindled me out of before they rebelled. They were brave enough to steal long before they found the courage to fight, and months before they dared fire a shot they repudiated their honest debts. The swindling, scoundrelly traitors! And now you have done your worst, and been whipped, cowed, and beggared, you have the impudence to come and demand payment of debts which you pretend Northern men owe you! Yes, with your hands hardly washed clean of the blood of loyal men, and the butternut rags still hanging about you, you are traveling through the loyal States on a collecting tour. If I had my way, every mother's son of you should hang for a traitor, and every acre of your land, and every horse, mule, cow, hog, sheep, and chicken that runs over it should be given to your slaves."

"So you deny the debt, then?" interrupted his hearer, white as a sheet.

"Deny the debt! Ha! ha! It so happens there's no debt to deny in the present case. No, no; if any bloody traitor ever brought money to Chicago, he gave it to some Copperheads to keep, and not to John Richardson, the rebel-hater."

The rebel-hater's visitor knocked him down, and rushed from the house.

"When does the first train leave for the South?" inquired Johnston of the clerk at the Sherman House.

"It is too late for the Cairo train, but one leaves for Cincinnati in twenty minutes. The omnibus is at the door now."

"Have my baggage brought down, if you please."

And he was soon speeding southward over the moon-lit prairie. Of course all idea of further continuing the search was abandoned—abandoned in disgust and self-contempt that he could ever have been fool enough to look for honesty, or honor, or generosity to a fallen foe from a race he had always known to be vile, though he had never personally known them at all.

He reached the steamboat landing at Cincinnati next day too late for any of the up-river packets except one bound for Wheeling, on which he embarked, being assured by the clerk he would be put off at Damarin's Landing about nine o'clock the same evening. His head was busy with forming plans for the future, but as yet he had decided on none of these, and his mind was in a condition to be drifted away easily by any side current that might come.

Soon after the cabin lamps were lit, a passenger approached him with a proposition to make up a game of euchre. "Only for amusement," said the man; "I never play in any other way." Johnston accepted, though quite aware that two or more of the players would be professed gamblers; for he had acquired remarkable skill at cards, and

was not so wholly innocent of the various tricks of the profession but that he could meet and foil them. He won—won repeatedly, and pocketed considerable sums. The excitement about the table was high, for the company appreciated and enjoyed the state of things. Thus, when the bell rung for Damarin's Landing, and the clerk informed Johnston of it, he was not disposed to quit his winning game, and declined to go on shore. Late in the night he rose from the cards several hundred dollars richer than when he sat down.

In the morning his enticer approached him with a proposition to be his confederate in a gambling expedition to the oil regions of West Virginia, where vast sums were being lost and won by the in-gathering adventurers from all quarters of the land. The captain's skill at cards was such, he said, that if it were associated with some of his own professional experience and knowledge of men, there would be no doubt of their making "a big thing," as he expressed it. Johnston did not consent to the disgraceful proposal, but he did not absolutely refuse, and when the two left the boat at Parkersburg they stopped at the same hotel for the night, and the next day were seen traveling together in the direction of the new oil wells.

CHAPTER IX.

It was about a fortnight after the departure of Captain Johnston from Stone House that Robert Hagan received orders that he should, early in the morning, take a skiff-load of wheat down to the mill at Concord, and get it ground. Pleased with the expedition, he was up betimes, and, after loading the little boat with as many well-filled sacks as it could carry and keep dry, he pushed off and pulled for the middle of the stream, intending to take advantage of the current in its full strength, since the morning fog, which filled the valley from the surface of the water to the level of the banks, and from thence up to the tops of the hills, was so dense that no steamboat would dare be moving to run him down. Thus, though he could but dimly see the stern of his own skiff, he felt absolute safety on the bosom of the mighty river.

O man! O boy! how little can you know where beneath the skies is safety or danger for boy or man! Robert had already turned the bow of the little craft down stream, and was pulling cheerily away, mentally defying the biggest steamboat on the river to touch or hurt him, though one of them, from her mooring close by, just then began to blow off steam with a roar so loud and so long it almost stunned his every sense, when—what's that? who goes there? As he sits at his oars, looking toward the stern, there

glides noiselessly across the wake a boat formed of mist and shadow, bolt upright in whose stern seat, with folded arms and scowling front, was the spectre of the man he had killed! The next instant a blow between the eyes knocked the beholder backward into the bottom of his skiff.

The only condition upon which the presence of ghosts is tolerable is that they do not strike. One sense may support the perception of them, two hardly; and if the victim in the present case had possessed imagination, he would scarcely have survived the double shock received. As it was, pure and unadulterate horror thrilled him to the tip end of every uplifting hair of his head, and long he lay without nerve or will. When he was strong enough to sit up and look and listen, the din of rushing steam had ceased, and nothing was to be seen, nor any sound heard, except dimly and doubtfully far away what might be the noise of oars. Then the poor boy, drifting at the will of the deep, impetuous flood, enveloped with the white darkness of the terrestrial cloud, got upon his knees and prayed—prayed till his white visage grew purple, and the cold sweat that was upon him became hot, while his unpiloted boat was borne miles beyond its destination. He prayed that the vision of his victim—often before seen in dreams, never till now with waking eyes—might fade out of sight and mind, might go to its rest, might be received into heaven, or cast down into hell, or in some other way disposed of effectually and finally. He prayed directly to the spirit of the dead man to forgive him for the act of war, or murder, or homicide, in the first, second, or third degree, whichever it might be, and urgently recommended him to submit quietly to death, since return to life must be impracticable; begged that his tender years at the time he did the deed might be taken into account, as well as his ignorance of reading and writing, and that the provocation might be charitably considered, as it was in the celebrated Sickles case. He prayed finally that the Great Judge would pardon his soul when he himself should die, and admit him into that heaven, at least, where the murderer went whom he saw die on the gallows after singing a cheerful hymn on the scaffold. He promised never again to shoot any human being so long as he should live, and, above all, never to make war again—neither “on his own hook,” nor on government account—no, not to save the life of a dozen nations.

Very foolish stuff indeed; but how much foolish stuff is uttered in prayer by people not near so much in earnest as poor Robert was!

His uncouth religious exercise did him good, and, what was more, his uncouth petition was granted; for the spectre never appeared unto him any more from that day

forward, neither to his sleeping nor waking senses.

Having come out of his agony, he resumed the oars, which, being adjusted with swivels, had not gone adrift, and without knowing that it was one of them had “caught the crab” and struck the blow attributed to the ghost, rowed toward shore till the dead-water was reached, and then finding himself three miles below Concord, made every exertion to recover lost ground and time. But, do his best, he was unable to get back with his flour to Stone House until the close of the day. In the evening the gossip among the loungers under the apple-trees informed Robert that General Damarin had that day gone back to his command, to remain until he should be mustered out, and also that another brother of “the gal rebel,” as Bella was unpopularly called, had been to see her. He was described as being taller than the other and much better dressed. The rumor also ran that he had brought bad news, whose tenor being unknown its quality had been guessed at by those who saw the serious faces worn by the major and Mr. Damarin during the long walk they took back and forth in the avenue, and observed the absence of Bella from the supper-table.

The true story was that Major Johnston had come as well for the purpose of seeing a sister from whom he had so long been separated, as to explain to her and her protectors why she could not yet be removed to her own home. He brought a letter from his brother Charles, communicating his ill success at Chicago, and apologizing for not calling at Stone House while on his way up the river. It seems the two brothers had met with some pecuniary success in the oil regions, and were then engaged in an enterprise from which brilliant results would come if it turned out well. The major gave his sister a one hundred dollar bill, and left twice as large a sum with Mr. Damarin to be given her as it should be needed; any indemnity for what he had already expended on her account being peremptorily declined by the large-hearted farmer, though he who offered it consoled his pride by resolving to renew the offer in more pressing form whenever he should be better supplied with the means of carrying it out. He remained nearly the whole day at Stone House, and, like his brother Charles, made friends of all its inmates, the general included, before he left.

The family supposed very naturally that the enterprise alluded to was digging a well for oil, or speculating in “oil lands;” but they were mistaken. It was something a good deal safer; it consisted in conducting a faro bank, and doing a general gambling business. Hardly an easier and surer road to wealth, if not respectability, exists than professional gambling well followed; that

is to say, followed with cool head, steady nerve, and a close adherence to the principles which should govern it. But it seldom is well followed, and where attempted by young gentlemen like the Johnstons, who feel it to be a degradation, is almost sure to be pushed to hazardous extremes, and become associated with other vices incompatible with cool head and steady nerve, and especially incompatible with a thrifty care and disposition of the profits.

And thus, of course, it fell out with the two young Carolinians. For the first six months their success was most brilliant; for the six which followed, their course was down hill and among the rocks. The worthy object of saving a parental estate from decay, and reclaiming a sister from exile and dependence, which in the beginning they held up to themselves as a justification for using unworthy means, was lost sight of equally in the excitement of success and the despondency of failure. And before the end of a year they had gone many a mile on the road to ruin—and to crime. Now let the curtain drop, hardly again to be lifted, lest the reader, by following their career in its details of adventure, have his interest painfully abstracted from the true thread of this story, which he may hope will be spun of a brighter floss.

Wherefore, when another four seasons had come and gone, and the redbud and dogwood blossoms had again appeared and vanished on the Kentucky hills that frowned or smiled, according as their humor was, upon the Stone House and its people, Bella Johnston still found herself a prisoner there, with the day of her redemption more than ever uncertain.

On the second day following the visit of Major Johnston and the general's departure Mrs. Damarin, with the two girls, went on the boat to Portsmouth. And why did they go? Because Bella, despite her despondency, and through all her hatred and disgust toward her surroundings, both animate and inanimate, felt her pocket to be in peril of flames and combustion from the presence there of the one hundred dollar bill. Mrs. Damarin, who was invited to act as counselor, found it hard to keep the girl from buying every pretty thing she saw, in the order in which they met her eye, and quite impossible to restrain her from making all her purchases in double, so that Polly could have the same as herself; for Bella was as generous as she was inconsiderate. The bundles with which the tired shoppers returned home in the evening contained two black silk dress patterns, and numerous articles of flummery of the flimsier sort. But flummery and flimsiness had their use, and in the occupation of making up the materials purchased, with its difficulties, dilemmas, and deliberations, Bella found a solace, one

of the best possible to a woman in grief. And here let it be said that whoever would defend the apparently barbarous custom of hanging our bodies in black when our souls are afflicted might best do so by taking the ground that it compels a widow, that chief mourner of all, to occupy herself in the dreary blank that comes in between death-bed and grave with selecting and arranging crape and bombazine, muslin and cambric, jet jewelry and japanned pins, handkerchiefs and gloves, collars and caps, frilling and quilling, piping and fluting—an occupation so distracting that it amounts to a sort of diversion, and becomes, in spite of her, pleasanter than she knows.

Thus Bella, who was not a widow, but a young maiden with a rich nature, responsive to all that gave interest or enjoyment, before the end of the fortnight required to make and fit the dresses and accessories, had become almost cheerful, and when her dress was finally tried on, seemed as happy as Polly; and though when taking it off she heaved a deep sigh, was careful not to do so until all the hooks and eyes had been unfastened.

After this the girls resumed their daily visits to the house of their instructor; and Robert was again happy in his daily duty of starting them off and receiving them on their return. Polly was happy that she was not yet bereft of her friend; and the friend, say what she might to the contrary, was at least comfortable.

CHAPTER X.

THREE months after he returned to duty General Damarin was mustered out of service, and came home again. Something had meanwhile happened to the young man that greatly altered him. A residence of three months with the family of a rich creole planter, whose elegant mansion he had during the owner's absence protected by making it his head-quarters, and in which afterward, on pressing invitation, he remained as a guest, had quite turned Damarin's head. He had seen pictures and statuary, and read guide-books, and listened to the conversation of his entertainers, who had spent a third of their lives in Europe, till he got fascinated with the Old World, and resolved on spending two years of his time and all of the savings from his pay in seeing, studying, and enjoying it.

Besides the desire to travel, the planter had inspired his guest with sentiments and purposes such as might worthily guide a young American favored by fortune with means and opportunity for making the precious but perilous exploration this one was about to undertake.

It was not until he had enjoyed a happy

month of idleness with his family that he ventured to make known his intention of leaving them. The farmer, looking toward the future, had already begun to puzzle himself with the question what to do with a brevet general on a farm, for he could hardly expect him to fling off the uniform and take to the plow and reaper as of old; but the proposed solution of the problem was one that astonished him. "Travel!" he exclaimed; "travel for two years! Why, isn't that what you've been doing these last four years? Where on earth do you want to travel now? Isn't your own country good enough for you?"

"No, it isn't," broke in the weeping mother; "his own country ain't good enough for him, nor his own home, nor his own folks neither. I see how it is. Those great folks he's been with have done all this. They've spoiled my boy. He isn't my own Willy any more." Repeating herself in this last remark, and employing her old formula of reproof that used to be all-powerful to subdue the willfulness of the Willy of six years old.

And Willy had trouble enough to satisfy them he was, and would ever be, the same loving son he had been, and reconcile them to his executing what he failed to persuade them was any thing but a boyish whim.

During the two months he remained at Stone House, before departing on his travels, the young general and his young prisoner were of necessity thrown much in the way of each other. And as each of them expected this to be their last intercourse, it was more free and more truthful than otherwise it might have been. He, on his part, found the study of her real character and disposition as interesting as her strange, intractable conduct had formerly been amusing—found in it much that needed to be excused, but more to admire. But what required no study to unveil it, what rendered investigation into mental and moral qualifications, and all those matters so important in the case of an ugly woman, of but small consequence to a man vulnerable through the eyes, as most men are, was Bella's rich Grecian type of beauty; not as yet developed in its fullness, to be sure, but every now and then announcing with a flash of expression that it was coming—rising like water in the fountain, swelling like the bud in its calyx, kindling and coloring like the sky before sunrise.

And Bella, on her part, patterning her deportment after that of her brothers, as she felt bound to do, treated him with respect and outward amiability, though without abating any of her hatred, which she privately indulged in more than ever, now he was near enough to be hated intimately; for we know the true enjoyment of hatred, as well as of love, requires proximity of the object; and her enemy, having come within

easy hating range, got thoroughly detested daily by the gentle companion of Polly and himself in their frequent rides along the ridge roads of the neighboring hills. And even while alone she would call up his image repeatedly to her mind's eye, to be hated again and again. After he had gone, too, she would call up the same image, though not to hate it; for what would be the use of hating one she could never see again?

"I do declare, Polly," said Bella, the day after the general's departure, "if my new black silk isn't half wore out already, while yours is as good as new!"

"No wonder," replied Polly, "for you've worn yours every day of the last fortnight."

"Have I?" said Bella.

ENGLISH IN SCHOOL.

NOT long ago I visited a gentleman with whom I am somewhat acquainted, though I have never learned to know him thoroughly, a professor of English in an institution of learning not a thousand miles away, and found him busily engaged in examining a large number of candidates for admission to his school. I have always felt an interest in the subject of English instruction, and have my own notions in regard to its dignity and importance as a branch of school and college learning, and I was therefore curious to know whether the professor's opinions tallied with my own, and what had been the result of his experience with the large number of young men whom he had had the opportunity to examine. In reply to a question on this latter point, he answered:

"Sir, it is lamentable. I am sometimes puzzled to know what boys in school do nowadays. The few who go to college, we know, study Latin and Greek after a certain fashion, and must, in order to obtain admission, give evidence that they have been over—of their real knowledge it might not be well, perhaps, to inquire too curiously—a certain number of books in those languages. But what are the rest of the boys about? Of one thing I am sure—they do *not* learn to use their mother-tongue correctly. Look at these papers." And he passed me a handful of examination papers, which, though the work of young men of sixteen to eighteen, seemed to be the productions of ill-trained boys of twelve. The writing, spelling, punctuation, and expression were all equally bad.

"I do not mean," continued the professor, "that they are all quite as bad as those. I have shown you the worst half. But I do mean that it is the rarest thing to find evidence in these papers of thought, of reading, or of real mental growth, such as you ought reasonably to expect in a young man of seventeen, the graduate of a high school. And yet I know they come from schools where the teachers are diligent, and the

scholars not altogether idle. There can, it seems to me, be but one explanation of the astonishing fact that school life seems to pass over these boys and make next to no impression as regards improving their taste, gives them next to no real knowledge of English literature, and fails to make them in any degree masters of their mother-tongue. That explanation is that the *methods of teaching* are bad."

"Why," said I, "they study English grammar, don't they?"

"Yes," he answered, gravely; "but on the present system it is not begun early enough, nor pursued with sufficient thoroughness. If we were thoroughly consistent in our present method of teaching English, we should begin with the babies, and instead of teaching them, as the first words they utter, to say *papa, mamma, moo*, and all the rest of the infantile vocabulary—a foolish system, based upon that absurd doctrine which the learned Professor Max Müller so justly stigmatizes, you know, as the 'bow-wow theory'—we should be thoroughly logical and philosophical, and teach them, as their very first utterances, to say *noun, participle, preposition, objective, subjunctive*, and the like. These words, it is true, would be found to be slightly more difficult for the vocal organs at that tender age; but with our improved systems of vocal gymnastics, we might confidently expect to overcome the difficulty; and think what a firm foundation we should be laying! Why, 'Greene's Analysis' might be begun with clever children in the primary school, and the whole philosophy of linguistics completed at the earliest possible moment. There is, to be sure, a certain appearance of putting the cart before the horse in this method, because a caviler might object that you can not profitably analyze a thing till you possess it, and in all this philosophizing *about* language no provision seems to be made for acquiring the language itself; but then you know what treasure of pure English the children gather in the street, and what models of idiomatic style are set before them in the newspapers: so that seems to be provided for. And, on the other hand, the parents would be perfectly satisfied that their children were getting 'learning;' for the popular notion of learning is that it consists in hard words, and is something as far removed as possible from common-sense."

I laughed, and had to acknowledge that there was some truth in that. "But," I said, "you surely would not go so far as to exclude the teaching of English grammar from our schools?"

"I would exclude the teaching of our present English grammars," said he. "If I could have my way, I would gather them all into one huge pile, and, making a bonfire of them, offer them as a sacrifice to the wronged

genius of our noble mother-tongue. The original pattern on which they are all constructed was made before the science of comparative philology was known, and by a classical scholar who took for his model a Latin grammar as Latin grammar was then understood. And as the Latin language is radically different in its structure from the English, being a simple and an inflected, while the English is a composite and an uninflected language, the consequence has been that a parcel of absurd forms and unmeaning rules have been foisted into our English grammars which represent nothing real in the language. And, worse than this, as our school-book makers of the present day are sure to be innocent of any sound knowledge even of classical, much more of comparative philology, and are in Egyptian darkness in regard to the general structure of the Teutonic family of languages, to which the English belongs, the result is that the handiwork of our booksellers' compilers as it increases in bulk diminishes in value; and the superstition that it is necessary to master the empty jargon and verbiage of these books is what kills the life out of English instruction in schools. All that they contain that is of the least value to children might be put into ten pages."

"I am curious to know," said I, "if you are going to take away one of the main pillars on which our public-school education rests, what you propose to substitute in its place?"

"I would substitute, for one thing," said he, "the real study of English. Grammar is metaphysics in disguise, though in the attempt to adapt the study to the youthful mind our school grammars become what Professor De Morgan very justly said that most school arithmetics were—ships of war with their guns thrown overboard. Grammar being properly the philosophical analysis of the structure of language, and language being the instrument and obedient servant of thought, grammar, properly studied, becomes the analysis of the mental operations, than which no study can be worse fitted for the youthful mind before its powers of abstraction and reflection are developed. What can be more preposterous than for children to attempt to master all the profound and subtle movements of a fully developed mind, as they display themselves in thought transformed into language—movements which tax the abilities of the maturest metaphysician to follow? We cover up all these real difficulties with a set of dry and empty rules and formulas, and then impose this abracadabra on the mere memories of children. What wonder they don't know their mother-tongue! If you would know what the real difficulties of grammar are, read Burggraaf's '*Grammaire Générale*,' or the paper on the nature and

analysis of the verb in the Rev. Mr. Garnett's 'Philological Essays,' or the discussion on the nature of the parts of speech in the new edition of Mr. James Mill's 'Analysis of the Human Mind'—though I would not have you suppose that I agree to his philosophy—and then see what sort of a study this makes for children, even with its guns thrown overboard.*

"But what do you mean," I asked, "by the real study of English?"

"I will answer your question by another," said he. "How do your Cambridge College crews prepare themselves—for I suppose you know—for that great event, the college boat-race? Do they all put themselves into the anatomical class, and study minutely and microscopically the anatomy of the biceps and other muscles?"

"I never heard that they did," said I; "I think, as a general thing, they know very little of the anatomy of the biceps. I believe they put themselves into their boats and practice rowing every day."

"Exactly," said he; "and they thereby gain skill in the use of the oar, and strengthen their biceps, though they may know nothing of its anatomy. Do they not?"

"They certainly do."

"And of two crews, one of which had spent two-thirds of its practicing time in studying anatomy, while the other had spent the whole in rowing, which do you think would be most likely to win the race?"

"Clearly the latter," I answered.

"And do they sometimes even win the race without so much as knowing which the biceps is?"

"I think, in the present state of college anatomical instruction, that may safely be predicated of prize crews."

"Well," said he, "then I think we may safely affirm that though, other things being equal, such knowledge would not hurt them, yet it is clearly superfluous and unnecessary, so far as regards winning the race. Now the instruction which I would give to children in their mother-tongue is of a precisely similar kind. I would have them learn it first by using it, and in no other way. I am finding no further fault with grammar, which is a very noble study, and should by all means be cherished, in its proper place and time, than that it is utterly unsuited to be the chief instrument for the mental discipline of children, and, beyond the barest rudiments, should not be taught them at all.

"What should you think," he continued, "of the wisdom of those who, having in charge the bodily health of these children,

should set them down day by day to a table spread with the bones of the meat, the chaff of the wheat, and the husks and rind of the fruit provided for them? Would not the youngsters present a somewhat thin and meagre bodily appearance? and would not their healthy youthful appetites rebel against such a diet, and call for something a little more juicy and nutritious? What would seem preposterous treatment of their stomachs is our orthodox school method of treating their brains. Instead, for instance, of making them love and appreciate Shakespeare, we teach them to *parse* him—a process which results in dime novels and other literature of that sort as their actual reading, though possibly some may attain the height of Mr. Tupper."

"You would, then, if I understand you," said I, "have the children learn English, even in school, by reading good authors, and by writing down their thoughts the best way they could, without regard to rules?"

"Yes," said he, "under the guidance of teachers who, having been taught to think and feel themselves, know how to make the children feel and think. How do you write yourself? Do you square your elbows and say, Now I will illustrate my subject by a metaphor? or, Now I will be sublime according to the rules of the much-to-be-discommended Mr. Quackenbos? Do you keep that vast abortion, Mr. Gould Brown's 'Grammar of English Grammars,' constantly by your side, and search painfully through his 1102 pages to see whether by chance you may not have violated one of his, say, 40,000 rules? I think you do no such thing. You know well enough that the two conditions of good writing are, first, clear thinking, and second, the command of a copious vocabulary, gained through a loving familiarity with good authors. Now I would have that sort of training begin in the primary school, just as I would have the children's training in science begin there."

"Training in science begin in the primary school!" exclaimed I. "Is it not enough to begin rhetoric there? You surely would not bring in all those formidable ologies besides?"

"Indeed I would," said he; "zoology, ornithology, entomology, ichthyology, paleontology, and all the rest of them. They contain the very objects the Creator has provided as the stimulants of childish curiosity, and—what is not so often observed—they are the main and proper subjects on which to begin the exercise of the child's faculty of language.* Which would you prefer as a

* Abundant evidence might be adduced to prove that the best and most idiomatic among English writers have paid small attention to the study of philology, and that very bad writers may be found among the grammarians; but nothing is more long-lived than an educational superstition.

* That the only possible instrument the human mind can employ in its abstract thinking is the symbol-language furnished by the phenomena of the material world was long ago observed, and is a principle in the philosophy of language which every new research only more fully confirms. The dry juiceless-

school composition—a boy's description of his last shooting excursion, or a girl's faint reminiscence of last Sunday's sermon on the virtuousness of virtue? Are you going to be taken in by pedantic Greek names? What is entomology but catching and examining bugs? And can't a baby catch a bug, and wonder at its curious form and ways? And does not all science grow out of that very wonder?* What is the youthful mind curious about—at least till we deaden it with our preposterous schools—but about these very marvels of creation which we do our best to spoil for him with our learned jargon and our grammar rules? Why, every village school should be an Agassiz museum in miniature, and the children should be continually writing learned memoirs upon its contents—learned to them, though not, perhaps, to the American Academy of Arts and Sciences."

"There is certainly something in what you say," said I; "and I suppose, as you would have natural history begun in the primary school, you would have physical and, perhaps, chemical science begun there too; for there seems to be no limit to the number of studies you would introduce into this brave primary school of yours?"

"Indeed I would," said he, "and in one sense there is no limit, save the possible subjects of human knowledge. Children are even philosophers and metaphysicians in their own childish fashion, and ask questions sometimes which it puzzles their elders to answer. I would therefore include philosophy among my primary-school studies. And surely the unspoiled minds of children are 'of imagination all compact,' and a first and foremost primary study should be poetry. Our schools ought to be represented by a series of concentric circles, which should have the primary school for a centre, and then the little human soul should take its first feeble steps in all directions out into the vast domains of knowledge, and no further in one direction than into every other. But do you think a diagram of concentric circles would represent our school course now, so long as a dead grammar and an equally dead

arithmetic monopolize the lower classes, while the upper are crammed with a farrago of undigested misinformation?"

"I am afraid our diagram would turn out a much more irregular figure," I answered. "There is certainly a deal of mere cramming now in the upper schools on subjects which can not be properly learned, because the foundation was not laid in the lower ones; and, on the other hand, a habit in the elementary schools of carrying the few subjects which make up the meagre course of study far beyond the real capacity of the children to understand them. But I anticipate one objection. How about providing philosophical apparatus for so many schools? Would not that prove altogether too expensive?"

"You mean the brass and mahogany gim-cracks," said he. "They are nuisances in this stage of proceedings, for they lead the child to think of science as something different from the real investigation of the quiet forces in the midst of which he lives. If the teacher knows her business, she will know how to use the school pump for apparatus, and the pulleys in the window-sash, and will find lessons in the carpenter's shop and the grist-mill, and know how to teach chemical affinity with a tumbler and an old tin pan and a pinch of chemicals from the apothecary's. Then the boys will whittle out apparatus with their jackknives, instead of hacking the school desks to pieces—for Yankee boys must whittle—and will set up their mill-wheels in the brook, and thus we shall get the raw material to make engineers of."

"The part," he continued, "which grammar plays in cutting the throat of real English instruction is played by arithmetic in cutting the throat of real scientific instruction. After children begin to cipher, why should they not have something to cipher about besides everlasting bushels of wheat and barrels of molasses? Because there is nothing else provided for them to study, we carry on their study of arithmetic much too far and too fast, and, loyal to all the absurdities of our educational philosophy, entangle their minds in the metaphysical abstractions of the theory of numbers before we have provided them with any thing (except the molasses barrels) to employ these numbers upon. If arithmetical instruction were carried on slowly, and side by side with physical instruction, and as its instrument, the higher parts which are now learned by rote would come in at a point where they would be really understood. School instruction in arithmetic has been degenerating since the days of Warren Colburn. I declare to you, if I could have my way, I would throw our school arithmetics into the same bonfire with the school grammars. The sensible teacher does not need them, and to the child they are a mere darkening

ness of much of our theology arises from the fact that our modern scholastics, profoundly ignorant of modern science, will persist in looking upon it as an enemy rather than a friend. You might as well look for an inside without an outside as for a true theology or a true metaphysic without true science; and we shall never succeed in teaching children language effectively till we begin the process as nature meant we should, by furnishing them first with the material out of which language is created—namely, a knowledge of material things.

* "I see, my dear Thætetus, that Theodorus had a true insight into your nature when he said that you were a philosopher; for wonder is the feeling of a philosopher, and philosophy begins in wonder. He was not a bad genealogist who said that Iris, the messenger of Heaven, is the child of Thæumas" (Wonder). —*Plato, Theæt.*, 155, *Jowett's translation.*

of knowledge. The school arithmetic should be no larger than the school grammar. Then why, I should like to know, is not the science of form begun with children as early as the science of numbers, except that nobody knows how to write an elementary geometry, and fill it with real practical illustrations? I grant that something has of late years been done for art by the introduction of music, and sometimes when I hear the sweet singing of our school children I am tempted to pardon all the short-comings of our schools in consideration of its beautiful influence."

"You are a terrible Utopian," said I. "Why, I don't see but if you had your way school would be actually a pleasant place, and children would be absolutely interested in learning."

"Perhaps that would prove the remedy for several evils," said he; "truancy, for instance, and tardiness, and the dire necessity for the continuance of that relic of barbarism, corporal punishment, and the indifference of parents. But I am sure that one result would be that children would learn two things they do not learn now—namely, how to think, and how to use their mother-tongue correctly."

And I left him, pondering much over his Utopian ideas, but, on the whole, rather agreeing with them.

KING MIDAS'S GRANDDAUGHTER.

MISS MARLEY, the great heiress! It really seemed that she must be descended from somebody whose touch turned every thing into gold; and the name some spiteful wit coined on her appearance in the world—counting that between Washington Place and Forty-second Street, careful not to go too far east or west—fitted so perfectly that she would never get rid of it.

Yet, two years before, I suppose it would have been said that she had no ancestors to descend from, for she lived then up among the Berkshire hills with her step-mother, and the thrifty woman, like a genuine daughter of New England, made the most possible out of her stony little farm, and added to her means by receiving lodgers from town into her quaint old brown house during the summer months. But she died one rainy day, and Lydia sat down to meditate whether school-teaching, plain sewing, or following her step-mother's plan was likely to afford the most satisfactory livelihood.

She was interrupted in her meditation by the arrival of a letter from California, and the puzzling reflections were never resumed. Her uncle John, who had gone out to the Pacific shore twenty years previous, and had scarcely written a line since to the relatives who considered him the ne'er-do-well of the family, was dead, and Lydia became possessed of his precious ingots.

She kept herself quiet all that spring and summer, but the next autumn she wrote a clear, matter-of-fact letter to Mrs. Phillips Saymore, whose blood, as every body knew, was nearly as blue as a Spanish hidalgo's, and whose verdict made or unmade people, though she had not been able to put new carpets on her floors for the last ten years. The summer before Lydia's mother died Mrs. Saymore had spent several months at their house, and the granddaughter of Midas understood her thoroughly—pride, debts, limited means, and all. She announced a straightforward proposal; she wanted to live in Mrs. Saymore's house, and be introduced by her into the pomps and vanities of a wicked world. There was still a year to elapse before she would reach her majority; she had a right to choose a guardian to assist her trustees; if Mrs. Saymore would accept the position, and so many thousands that I will not excite your envy by setting them down, the opportunity was open to her.

Mrs. Saymore, like most azure-blooded people of this era, knew better than magnificoes in old times did, that pride has limits. She was willing to be guardian to an heiress, and to accept the reasonable emoluments accruing therefrom. It was useless to invent a romance about Miss Lydia, or attempt to shroud her antecedents in pleasing mystery; too many New Yorkers were familiar with Berkshire and her mother's house for that; so Mrs. Saymore followed her ward's advice, and told the simple truth; it was enough.

Miss Marley arrived, and her guardian, looking at her with critical gaze, said, inwardly,

"She's better than a beauty—thoroughbred in appearance as a duchess! I remember her perfectly now; she was an uncommon girl. She can write English too, her letter showed, and that's more than Madame Chonfleur's pupils can."

Miss Marley bore the scrutiny with beautiful unconsciousness, and read her hostess's verdict in her face.

"My dear," said Mrs. Saymore that evening, after they had grown comfortable and confidential, "the season has hardly begun; you will have plenty of time on your hands; would you like a few French lessons? You know every body must speak it nowadays."

Miss Marley did not even smile; she answered fluently in the angelic language itself, and fully satisfied her companion.

"Where did you find masters?" she asked.

"Oh, an old French lady has lived near us all my life," replied Miss Marley, carelessly. "The homeopathic doctor taught me German, and I used to get through the winters by prosing over algebra and Latin with him."

"Never mind those," shivered her guardian. "Your French is beautiful; I don't

speak German. Well, suppose you were to find out if you had a voice."

Miss Marley went to the piano, and sang an old English ballad so charmingly that Mrs. Saymore felt something damp back of her eyelids.

"Perfect!" was all she could say in her surprise.

"It ought to be tolerable," returned the heiress, coolly. "Miss —— used to come to our house summer after summer, and she taught me."

She mentioned the name of an opera singer as well known for her generous heart as her beautiful voice, and Mrs. Saymore was dumb; she had expected a parvenue, and found a prodigy. But a little lecture on the habits of society was necessary. Her ward listened to the end.

"Three winters ago," she said, "I staid a month with the Geddis girls; you were in Europe. They couldn't pay us their bill, and invited me to visit them, and very rude they were. But I went to three balls and two dinners; as nobody spoke to me, I had plenty of leisure to watch people. I dare say I sha'n't do any thing very outrageous."

Mrs. Saymore did not pursue the conversation: there was an odd smile on the heiress's lip which made her unwilling to offer further suggestions.

In due time Mrs. Saymore gave a ball to usher her ward into the world—a ceremony as important as a christening and the dinner after. The venerable lady never made mistakes in matters of taste, so there were no new carpets on the floors; every thing was heavy, ancient, and faded as ever. That fresh *tapisseries* should brighten her stately rooms Mrs. Saymore fully intended, but only gradually; she did not choose people to whisper that the heiress had refurnished her house.

Miss Marley wore white silk, and crimson roses in her hair, and disappointed the Geddis girls and feminines of their ilk, who had prophesied that she would display all the colors of the rainbow, and more jewels than a Hindoo idol. She behaved like any other reasonable young woman; only there was an entire lack of self-consciousness, apparently, which few could emulate.

So Lydia Marley floated easily up to the lofty height to which fate had called her, and found herself often more bored and solitary than she had been in the farm-house mending pillow-cases and feeding chickens, varying her occupations by studying big Latin books of an evening when the household duties were disposed of. The round of balls, dinners, operas, amused her for a little, but this was not what she had expected. She wanted something to fill up her life, and she no more reached a realization of her dreams than she had done while trying not to rebel at the narrowness of her old existence.

Sitting in her opera-box one night—the box she was careful to call Mrs. Saymore's—and watching the brilliant throng listlessly from the shadow of the amber curtains, she saw a face which carried her back to her girlish fancies, and she knew—for she never attempted to deceive herself—that from that time to this they had not ceased to influence her actions and plans.

"There's Lasley Payne," Mrs. Saymore said to a lady who had come with them. "I heard he was back from Europe. I declare, he is handsomer than ever."

The summer before her mother died Lydia had seen the young man daily for weeks—he was staying for a time near them. She had never exchanged a word with him—could not have told that he had ever looked at her—but somehow the recollection of that tired face, with its melancholy gray eyes, had remained photographed on her memory with a vividness which surprised herself. I am not telling you that she had been idiot enough to love him, or fancy that she did; but the thought of him came up afresh as her new life opened before her, and it was a disappointment, as if missing a friend, when she learned that he was across seas.

On the way home that night Mrs. Saymore wondered why Payne had not come up to speak to her, as she had known him since he was a boy. They met him out the next evening; but he was not introduced to Lydia. The next morning she encountered him in the street. When she returned home he had just left the house. Had he chosen the opportunity when he knew that she was absent? It looked like it; for more than a week went by, and though they met each other night after night, he never found his way into the adoring circle which surrounded her.

"The first person who has not rushed up to pay court to my money," thought the heiress; and it meant a great deal to her.

Mrs. Saymore gave a musical party one evening—the new carpets were down—and Lasley Payne condescended to appear; but he was devoted to an ugly little Frenchwoman, famous for her wit, and Lydia was busy trying to keep the dandies from talking to her during the music. At last Mrs. Saymore was beside her, saying:

"My dear, Lasley tells me he has never been introduced to you. Miss Marley, Mr. Payne. My ward and my old friend's son ought to know each other."

Lydia looked up into the handsome face, and read in it plainly enough the fact that he by no means agreed with his mother's friend in her opinion. Miss Marley was neither angry nor hurt. This sort of indifference was rather agreeable after the surfeit of devotion she had undergone. Somebody called Mrs. Saymore away while he was saying something about the music in a tired fashion.

"You needn't victimize yourself further, Mr. Payne," she said, good-naturedly; "Mrs. Saymore has gone."

"And Signor Rubelli is going to do something wonderful on the piano. I always notice you never let people talk to you when there's music," he answered.

He had observed her, then, unconscious as he had hitherto appeared of her presence! He stood by her until the signor had finished his musical calisthenics; then he said a few more civil words, and went off and hung over Alice Gray, as he was in the habit of doing frequently, Lydia had remarked.

That was the beginning of an acquaintance, however; and the next day but one he called to inquire if Mrs. Saymore had recovered from her fatigues. On Lydia's return the old lady told her that he had been there, and was coming back to dine, and see them safe into their opera-box.

When Lydia went down stairs after the dressing process, which cost her much more trouble and thought than it did in general, much to her maid's secret wonderment, she found old Beau Courtenay as well as Lasley Payne; so, naturally, the younger man fell to her share. Mrs. Saymore and her contemporary were deep in a discussion about matters and people connected with their youthful days; and Miss Marley marveled if Payne would act bored, and rather made up her mind, if he did, she would go quietly to sleep before dinner was announced. But he was lively and agreeable, on the contrary, and looking as handsome as only a blonde man with violet eyes can manage to do. They were turning over a volume of rare old prints on the table, tracing resemblances in the faces to people they knew, when he said, abruptly:

"I have never been able to decide whom you reminded me of. The first night I saw you at the opera I fancied that I had met you before."

"You had," she replied, coolly; "I recollect it perfectly."

"In Europe?" he asked.

"In Berkshire, two years ago; over that."

He looked up inquiringly.

"I was driving the cow home," said she, playing with her bracelet, and showing a pair of slender white hands which a countess might have envied. "The boy proved false that night; so I went after Cherry myself, and Cherry was obstinate, and didn't want to go home."

"Very wicked of Cherry," returned he, laughing.

"I stepped in the mud, and you came along and turned Cherry on the straight road," continued she. "I was so dreadfully ashamed that I forgot to thank you: let me make amends for my rudeness now."

"I should like to see those old hills again," he said.

"Some time, when I have been every where, and am tired of the world, I shall go back there to rest," Lydia said.

"Do you find the world so very interesting?" he asked.

"No; but I shall like to travel. After all, I think the real want is for something to do."

"I should think you had enough. Not satisfied with being a fashionable woman, one hears of your charities, your hospitals, and your good works generally."

"One hears too much of them; but it is not always my fault, though you do sneer, Mr. Payne."

"I did not mean—"

"Me to see it," she interrupted, smiling still.

But dinner was on the table, and this talk ended for the time, because Beau Courtenay always waxed amusing over his wine—fortunately for him, else I am afraid he would sometimes have gone fasting to bed.

It was a pleasant evening to Miss Marley. She was sorry when she met Payne the next day at somebody's breakfast that the ice had congealed anew, and they seemed as far off from acquaintance as ever. But Mrs. Saymore had him at the house again, and again the evening passed delightfully to Lydia. As more than a fortnight of these alternations ensued, she found herself puzzled, and was thinking a great deal more about the man than she was aware of. Then Alice Gray went to Washington, and Mr. Payne had plenty of leisure time on his hands; and Mrs. Saymore was always begging him to go here or there with them, or keeping him to dinner, and tyrannizing over him in a friendly way, so that the two young people were constantly thrown together; and when he chose not to be moody or distant, he was very agreeable.

"It is not my fault that I come so often," he said, frankly, during the first week. "You must blame Mrs. Saymore."

"I don't think I feel inclined to blame any body," Lydia answered. "Am I so very formidable a person?"

"Formidable is not exactly the epithet I should have chosen," he said, with a quick glance from under his long eyelashes that made her heart throb.

But he straightway waxed moody and satirical, as if vexed with himself for showing any earnestness, and was bent upon going away. In the end he was persuaded to remain, and talked of all sorts of things which other men did not, as if an old woman were worth attention and a young one not exactly a pretty puppet, with only a capacity for understanding flattery.

That was the beginning of three beautiful weeks to Lydia Marley—the sort of enchanted episode during which one neither thinks nor reasons, is content to float on through the charmed atmosphere like some dreaming

night in a fairy legend. It would be useless to elaborate the record; it could not fail to sound commonplace, with its account of balls and breakfasts, of operas, and the few hours of solitude, which only increased the potency of the spell that was upon her. But you know the story. When you lived it you did not find it tame or old; it was fresh and new, as when it first descended in its glory upon Eden. Three blessed weeks, then she wakened, and found herself in no elf-land bordered by the Greek poet's purple ocean, but cast, faint and wounded, upon a barren shore, where the black rocks cut her feet, and only brambles grew, that tore at her like living hands.

She had been driving and to see some pictures with Blanche Osgood, and came home so tired that the bare idea of mounting the stairs was not to be endured. Mrs. Saymore was out, so she went into a little snugger, off one of the parlors, which appertained especially to herself, and where she was supposed to read novels and write the letters in which her sex are fond of indulging, or look over her trustees' accounts, but where, of late, she had done more castle-building than became a young woman with too many millions to have a right to be visionary and romantic.

She lay down on a sofa, and went as sound asleep as if she had been a new Perdita among her flowers, instead of one of the family of Midas. She was roused suddenly by the sound of voices in the room beyond—heard them, as she lay there between sleeping and waking, and one of them was a voice which so often mingled with her dreams that at first she could not tell whether it was real or only the fancy which had haunted her during her slumber. It was the voice that had piqued her often with its languor and indifference—had touched her by some pathetic thrill—made her heart beat by sudden intonations of passion and tenderness; but it possessed neither of these now.

"My dear old friend," it said, "there never is any use in arguing about such matters. I love Alice Gray, and I fairly detest your heiress. But I mean to be wise in my day. I think I may assert, without vanity, that I can marry Midas's granddaughter, and I suppose I shall do it; but I hate myself for a mean, miserable whelp, all the same."

"Alice Gray is a baby, and always will be; Lydia has brains, and is one of the most elegant women I know, and—"

"Granted—I beg your pardon for interrupting—but I've said all that over and over to myself. But it's just her elegance I don't like, and the cool way she has of talking of her old poverty; in fact, she is *antipatica* to me."

"You talk like a goose, Lasley."

"Don't I know it? You will have to be

content with my not behaving like one, if I can help it."

So much Lydia Marley heard before she could collect her senses sufficiently to stir—to remember that she had no right to listen. She got off the sofa. If she were dead, she remembered thinking, it could not be more difficult to move, or she colder. She wanted to go out of the room—away from the sound of those voices by which destiny had so cruelly forced its fiat upon her. She was feeling about blindly among the curtains for a door which led into a side passage, but some domestic, animated by a diabolical spirit of duty, had locked it on the other side, and she was a prisoner.

The pitiless ring of that man's voice came up afresh. She would have sprung down a precipice, leaped into a cataract of fire, to escape hearing the words, but they forced themselves upon her.

"Oh yes; of course there's nothing for it but marrying money—turn shark and devour the heiress; but I know how contemptible it is all the time. I have run through two respectable fortunes since I was eighteen, and am as interesting as laziness and sins of every sort can make me."

"Your family and position are an ample share for you to bring," returned Mrs. Saymore; "the woman you marry ought, at least, to supply the money."

"If I had a decent sum to begin with, I'd go into business. Other men make their own fortunes, and I don't suppose I'm a much greater idiot than fellows in general."

"Go into trade, perhaps," exclaimed the old lady, contemptuously. "For mercy's sake, Lasley, let a few descendants of our old families remember their blood and their traditions, and keep aloof from such vulgar influences."

Payne laughed bitterly at the speech, which sounded so much like one out of an old-fashioned novel, and made some reply, which was not audible.

"But you do mean to be sensible?" Mrs. Saymore said.

"Bless me, haven't I said so? I'll propose to Midas's granddaughter, and have it done with. You needn't send for her just now; I couldn't make my speech properly this morning."

The unwilling listener in the room beyond crouched low on the floor, and gathered the folds of her dress about her head to shut out those miserable revelations. She was conscious only of uttering the impious prayer, which comes so easily to our lips when trouble assails our undisciplined youth, that she might die—die and be done! Hope and youth and life had been suddenly crushed in this fearful earthquake. If she could only die there in the gloom, and get away from the ruins of the world which had fallen at her feet!

After a while she caught the murmur of their voices anew, then Lasley Payne's step—heard the door close; he was gone. Presently the door jarred again. Mrs. Saymore had retired to her room for her daily nap, and the coast was clear.

King Midas's granddaughter raised herself wearily from the floor, gathered up her bonnet and cloak, stopping to hunt for a glove as intently as if its recovery was a matter of the utmost importance; then she went away through the lofty halls, and hid herself in her bedroom, where every object of luxury, from the silken hangings to the jewels on the dressing-table, reminded her of the gold which had brought a curse so terrible.

May Spencer gave her fancy ball that night, and the heiress was queen somebody or other—for the life of her she could not recollect whom she was supposed to represent. Alice Gray had come back from Washington to be present, and had turned herself into such a pretty little shepherdess that she looked as if she had just stepped off a Watteau fan. People are so commonly attracted by their opposites that it was not surprising she had an admiration for the heiress, and she cooed at her and said pleasant things, leaning on Lasley Payne's arm. And the heiress was neither tragic nor ridiculous; she behaved just as she ought, and the gossips decided she looked remarkably well—only her dress was not rich enough; they believed she was stingy.

Hours after, when she was fighting out her battle in the grim dawn in the stillness of her chamber, Lydia could hear the echo of Alice Gray's girlish laugh, see the smile in Payne's eyes as he glanced down into the innocent face. If you know what jealousy and pain are, you can understand the full meaning there is in those simple words. She recollected the words that Payne had spoken the morning before—his willingness to go into business if he only had sufficient available capital. She could help him—it would be easy enough—and yet never let him discover the quarter from which aid came. In that case he would marry Alice Gray, and they would have their happiness. But what right had they to be happy at her expense? She would not lift her finger if it would save her soul from destruction, not if it were the only way to preserve it! Not a penny! Let them suffer! Was she not young too? Was it any harder for them than for her?

It would be more poetical to tell you that as soon as the thought occurred to her she determined secretly to place a million at his disposal—was ready to give up peace, every thing, to purchase his happiness. But it would not be true, any more than it would in your case or mine. Her fiercest prompter bade her marry him, and repay his treachery as she could do. For a while she thought

she meant to do that. At least, assist him toward a better and freer existence she never would—never!

She fought her battle, made her moan, upbraided Heaven—went mad, poor soul, as each of us has done in our time; but daylight came, brought its dull, prosaic round, and the Heavenly Father we are all so ready to accuse sent the strength that he sends to all of us, and for a season she was just as regardless and unbelieving as we are that it came from Him.

Two weeks after, Lasley Payne learned that some capitalist, ambitious to build a city, wanted to buy a tract of Western land which he owned, and Lasley discovered that the barren waste had a value he had never dreamed it would possess. The price offered was much more than the sum he had said he needed to start him in business, and make a man of him after all his failures.

The news came just as he was wondering how he stood with the heiress, trying to make up his mind to be utterly mean and worthless, and astonished to find that he doubted whether the chance was so open to him as he had believed. He could not have told in what it consisted—she was more friendly and frank than ever—but there was an indefinable change in Miss Marley's manner: he felt a whole world away from her and her real feelings.

The news came, the bargain was settled, the price paid, and Lasley Payne took himself and his competency down into Wall Street to his former guardian, and became a growling grizzly without loss of time.

The very evening of the day that he was enrolled among the busy bees of the world he met Miss Marley at a stupid reception, and she made room for him on the sofa beside her, scattering the dandies without scruple.

"I have been watching for you," said she, with that frank friendliness of speech to which she had lately treated him. "I congratulate you heartily. You see, I have heard all about it."

"One always does hear all about every thing," returned he; "and very tired one gets usually of other people's affairs; but I thank you for being good-natured in my case."

"Of course I appreciate your good luck more than your stately friends who were born to greatness would," she went on. "And you are going to add to it by cultivating business. I expect to see you disgustingly rich before you are done."

"I don't know that I am ambitious for more than a reasonable fortune," he said.

"It's a very nice thing to be rich," pursued she, in a rather hard voice. "Naturally, these pretty creatures about us, to whom wealth comes like their purple blood, by inheritance, wouldn't talk so; but you'll not

be surprised at such sentiments from King Midas's granddaughter."

Those were the last lying words she spoke: she was sorry as soon as she had uttered them. She need not be false to herself, and talk like this, in order to hide her real feelings. He was not thinking enough about her for there to be any fear of his discovering how difficult she found it to talk at all, or to behave with the languid decorum suitable to the situation. She began to speak seriously, and to encourage him, not by the idea of the money he was to gain, but by congratulations on the fact that he could have occupation, and be of use in his day and generation.

"I shall be very glad to work," Payne answered; but all the while he thought her somewhat intrusive and free with her opinions. He was waiting eagerly for Alice Gray's appearance; and it vexed him that this woman should have been first with her congratulatory speeches, and her air of patronizing interest. What was it to her? he impatiently asked himself. What did she expect to gain? Was she looking for a declaration, now that he was free to choose? He forgot that for a fortnight past he had felt it very doubtful whether a tender outburst on his part would not meet with a rebuff; but he remembered it in a moment, and these inward interrogations were the last unworthy thoughts he ever had where she was concerned. By the next words she spoke she made him heartily ashamed of his petty fancies—made him feel, too, that he had been a blind, conceited ass during the past weeks.

"I have been very impertinent," she was saying, "but I can't resist carrying my rudeness a step further. I congratulate you most of all on the happiness that has come within your reach."

He looked at her in surprise; man-like, he was ostrich enough to suppose his secret feelings an utter mystery, and with the usual instinct of humanity was ready to prevaricate.

"I don't—"

"Want to fib, ought to end your sentence," she interrupted. "Mr. Payne, I am only a looker-on in Venice, and see things that other people don't. I have no business to guess your secret, but I do."

"How could you have found out?" he began, awkwardly enough.

"As if I hadn't seen your face! Now don't be vexed—ah, you can forget it without loss of time. There comes Alice now."

She motioned him away, smiling full upon him, and for the first time he discovered that she was a beautiful woman when she allowed her soul to show in her face. Thinking thus, glad too that he had been kept from degrading himself in her eyes, he obeyed her playful gesture and went away to Alice.

Lydia Marley watched him go, and sat smiling still for the benefit of the troop of men who again gathered about her, bearing her martyrdom bravely as ever woman did in the olden time; and it was harder to endure than the fagots and the stake.

Two days later, Society was busy with the rumor of his engagement to pretty Miss Gray; and Mrs. Saymore sat in her room pondering on the best method of breaking the news to the heiress, and wishing that she were permitted to box Lasley Payne's ears soundly for his folly, because the old lady was wise enough to appreciate the difference between the two young women.

There came a quick tap at the door, and Miss Marley, beaming with life and joyful spirits, entered, saying:

"You must forgive me for disturbing you. I want to tell you my news. Now don't be aggravating, and say you knew it!"

"Is there any news?" asked the dowager, uneasily.

"Splendid news! Mr. Payne is engaged to that bewitching little Alice Gray."

"It is not acknowledged," the old lady began, unable for the life of her to help trying prevarication, useless as it was; but her ward did not allow her to finish.

"It will be at once," she broke in, with graceful eagerness. "She told me the whole story herself—with his consent. It was nice of them to be friendly, and let one have the news in advance of other people; one always likes that."

"Alice Gray is an affected little butterfly!" exclaimed Mrs. Saymore, more spitefully than was judicious.

"She is charming. You are in a bad humor."

"About as fit a wife for Lasley Payne as a pigeon would be for a Newfoundland dog," continued the old lady, wrathfully.

"I'm sorry I told you," laughed the heiress; "you are not in a mood for hearing pretty secrets."

"I hate to see a man make a fool of himself; but they always will," snapped the dowager, ungrammatical, but terribly truthful all the same.

Miss Marley showed the opposite side of the question, and she did it well; not a word too much did she say; and Mrs. Saymore owned to herself that she had been mistaken—the heiress did not care for Lasley Payne. It was very lucky, and Mrs. Saymore offered inward thanks that she had been prudent enough to hold her peace during the winter. Straightway she began to weave fresh visions for her ward; she must take her to Europe and find her a German duke. Lasley was right; she only cared for worldly advancement and success—was a very sensible girl, in fact. The old woman felt more attached to her than ever, now that she discovered there were to be no tears or crooked

temper, or any other sign of disappointment or approach to a vulgar scene.

So Lydia Marley had at least the satisfaction of feeling that no human being suspected her secret; she was saved from the horrible cross of having to endure pity. I might fill pages with the details of all that she suffered during the ensuing weeks, but there would be nothing new in the recital, alas for poor burdened humanity! Besides, she had done right in helping two human beings to what they believed their happiness, and I cling fast to the old-fashioned belief that God gives us strength to bear when we try to forget ourselves and strive after duty.

Lasley Payne had a few very happy weeks, like a dream or a poem, or any thing else pretty and unsubstantial; but it was heaven while it endured. Summer came, business was prospering, but he was not so engrossed that he could not allow himself a holiday. He was able to follow Alice to Newport and the other gay places in which her butterfly of a soul delighted. He was thrown constantly into Miss Marley's society, for Alice would never be out of her sight if she could help it; and Lydia felt irresistibly drawn toward the girl, as a mother feels toward the child that has brought her most pain.

Autumn appeared; people flew away from summer resorts like so many leaves before the wind; the roll of carriages parkward began anew; and Society commenced diligently painting its face for another winter season.

Lasley Payne was so far on the high-road toward success that it was decided now that his marriage was to take place before Lent. The glory had a good deal faded from his dream. He was making the mournful discovery that he had given his heart to a creature between whom and himself there were so few meeting points, so far as tastes and intellect were concerned, that it required all his love to keep the experiment of the future from proving a very dangerous one. But he loved her, more with the remembrance of youthful romance than the rapidly developing judgment of the present; and he would make her happy. She must always be a child—something to be watched over and petted, lying like a blossom on the outer leaves of his heart—utterly incapable of sharing the higher life for which he began to look—to be carefully shielded from trouble—never allowed to suspect his cares. Well, he loved her, and she was beautiful. No man could have every thing. He was an ungrateful cub not to be content!

Lovely she was, and charming. She was not consciously selfish, and that made the case more hopeless. Willful, capricious, wearily exacting after the novelty wore off; but she did not mean to be either one or the other. There was nothing of her—a pretty flower which had blossomed, but would

bring no after-fruit. Not character enough to have strong virtues or faults; and the worst thing was a dread of displeasing any body that made her full of artifices and petty duplicity, which the weak are almost certain to possess, and which are harder for a broad-headed person to endure than downright wickedness. Of course he lectured often, and she wept; they quarreled and made up; he tried to remember that she was a child, and to be patient, doing his best to keep under the spell of her beauty and her elfin fascinations.

Lydia Marley was a good friend to them both, and helped them as much as any human being could, though never obtrusively; for to attempt argument or real alteration in a character like Alice Gray's is about as hopeful a task as bumping a feather-bed—it slips out of your hands from sheer lack of solidity.

And Miss Marley was to marry very soon, people said, though the hero in the drama changed as often as the colors in a kaleidoscope; and with each new aspirant to whom she showed civility, whether a fop indigent to the soil of Manhattan, a stately Senator from the capital, or a scion of foreign nobility, Lasley Payne caught himself wondering she could for an instant endure that particular animal's dullness or imbecility.

But one dreary morning Dame Fortune woke in a bad humor, and, looking down upon Gotham, she decided that it was time she pinched the fingers of hitherto favored brokers and heiresses under her wheel. Gold went up or down—I forget which, nor does it matter—Wall Street went off into one of its spasms of fear and recklessness, and the whole country shook under the crash. Banks failed, railway schemes exploded like rockets, trust companies vanished into thin air, and the moral pestilence swept like a whirlwind over the length and breadth of the land.

But no matter how evil disposed a tempest, it can not overwhelm every body, and Lasley Payne was one of the lucky mortals not exposed to its fury. I imagine few people would have minded much if he had been—he was engaged; but Society contorted its face until the paint cracked when the rumor rose and spread that King Midas's granddaughter had gone down in the shock. The report rapidly grew into positive certainty. A California bank which her money supported had stopped payment; the Nevada silver company had struck a vein of sand; and presently the story was added that the treasurer of some company which held nearly a million belonging to her had fled with her gold to some far-off southern isle. She was ruined! Foreign nobles retreated; dandies groaned, and yet exulted that they had not been precipitate. The news was no mere society gossip; it reached Wall Street, and as-

sailed Lasley Payne in his office, as he sat poring over ledgers and watching eagerly that the storm passed at a safe distance. That night King Midas's granddaughter did not appear at the opera; she was seen at no ball; and every body imagined her at home shrieking in hysterics, with poor dear Mrs. Saymore administering *sal volatile*. They were so sorry for Mrs. Saymore!

The morning following Lydia Marley sat in the very room where sorrow had first overtaken her, with business letters piled about her, and she writing away as rapidly as if the chance of dinner depended on her diligence. Presently the door opened, and the deferential English servant, who was Miss Marley's horror, appeared with his inevitable silver tray and a card on it—Mr. Payne's.

"Certainly; show Mr. Payne in," Miss Marley said, as cheerfully as if she enjoyed having her grandeur swept away as suddenly as Aladdin's palace.

So Mr. Payne was ushered in, looking more pale and agitated than if he were on the road to the stake. He hurried toward Lydia Marley, and, grasping her hand, he said:

"I'm sorry for you, but glad for myself! I love you, and I can ask you to marry me, for you will know it is not the money I want."

Miss Marley held her pen in the hand that was free; she laid it quietly down, and asked,

"Did Alice send you?"

"She sent me away from her, at all events. That all came to an end three days ago. Charley Mayne has got money, and is a butterfly too, and I have turned into a grub, and she was tired of me."

"And your fancy can go from one extreme to the other so quickly, Mr. Payne?"

"You must know—you must have seen! I have loved you for months—ever since I really knew you, though I tried to do right. I did not own it to myself."

She attempted feebly to draw her hand from him, but he held it fast. She had grown very pale, and her head was averted, but she listened still.

"I have no right to speak," he continued, "no reason to think that you care for me; only I can't believe that I have a second time deceived myself. This stifled cry of my heart must have found some echo in yours."

Still she did not speak.

"I want you to know the whole truth—just how unworthy I am. Once I meant to marry you if I could for your fortune. I didn't know you. I was selfish and full of myself, but I was mercifully kept from the meanness of trying. Oh, since then—how could I have been so blind! Won't you speak to me? Won't you tell me if there is any hope?"

She turned her face toward him for one fleeting instant. He read his answer there.

"But," said Lydia, a long hour after, during which they could not have told whether they talked or were silent, "I must undeceive you."

"What do you mean?" he asked, kissing the hands—for he had possession of both now.

"You came here, animated by a sense of heroic duty, to help me in my trouble, and keep me from going out as a washer-woman or dairy-maid, and you have been swindled; I haven't lost a penny! I'm very sorry; I beg your pardon and Mrs. Grundy's, but I'm as dreadfully rich as ever."

He actually was disappointed for a moment, and she saw it. She thought she had loved him before, but she told herself she had never really known the feeling in its fullness till now.

"We'll try to bear it," she said, smiling through a few happy tears.

"And to be worthy," he answered. "You have taught me many things during the past weeks. What that means is the blessed lesson of them all."

DAME NATURE.

MEN say she is a priestess, stern and fair,
Perfect in beauty, and ensphered with calm;
Her rapt eyes lifted heavenward, unaware
Of discord in Creation's happy psalm.

I know her as a kindly, ancient dame,
Benign and garrulous through all the year;
Full of content, amid all change the same,
Gladdening the seasons with her great good cheer.

No goddess, lofty in fidelity,
But busy, happy, friendly with all men;
Wise and loquacious, innocently free,
Telling of what shall be and what has been.

She has unnumbered secrets in her care;
She screens her mysteries with sound and sight;
Yet half reveals their meaning every where,
And hints it in the sunsets every night.

She is a tender mother in the spring:
She pets each little leaf and blade of grass;
She teaches brooks and rivers how to sing,
And loads the winds with blessing as they pass.

And not less tender when the weary year
Lies down and dies amid the withered leaves;
She hath no more the treasures held so dear,
Yet keeps her quiet patience, while she grieves.

Daily, in trustful, kind simplicity,
She shows to men her beauty's excellence,
Willing that every human soul should see
Upon her happy face God's evidence.

Alike to poor and rich, to dull and wise,
She gives her flowers, her sunshine, and her breeze;
In every nook she hides some fair surprise,
And leaves no spot unloved on lands or seas.

Would that we all, like her, in rare good-will,
Made room for all things in our sympathy;
Content to labor patiently until
God's message, through our lives, is full and free.

OLD BOOKS IN NEW YORK.

MELANCHTHON, BY LUCAS CRANACH.—[FROM THE FULL-LENGTH WOOD-CUT.]

FEW of the many readers of this Magazine noticed in November, 1870, the statement in daily journals of the sudden death of William Gowans, a bookseller, in New York. In this city there were many who knew him and his remarkable store of books, and to them the announcement of his death brought an emotion of regret. For it is not likely that we shall soon see such a man or such a store again. He had been for many years in the business, and conducted it on principles quite different from any other of the numerous dealers in old books. His stock always grew, never diminished. He confined his purchases to no one department of literature. Hence it resulted that his gatherings were immense, and included works of

every description; and shortly before his death, when he had, as well as was possible under the circumstances, taken an account of his stock, he estimated that he had about two hundred and fifty thousand bound volumes on hand, and pamphlets by myriads.

Such a merchant deserves to be remembered on more accounts than one. He commenced life a poor boy, was always renowned for his strict integrity and unimpeachable veracity, and by honest and steadfast labor had acquired a respectable fortune in addition to his vast accumulation of books. He had peculiar ways of his own, was esteemed by many a gruff and not overpolite dealer; while, on the other hand, he had favorites among the numerous seekers after old books,

and with them was always genial, communicative, fond of anecdote, and very cheery. He did not like to have men come in merely to see his stock and hunt it over without an object. The customer he was always delighted to see was that one who wanted a particular book, and knew what he wanted. To such a visitor, so soon as the fact of his sincere search was made plain, Mr. Gowans was always attentive; and if he had the book, produced it, with a running commentary on it, on the author, on different editions of the work, and on kindred subjects suggested by it. He abounded in literary anecdote; and it is to be regretted that his personal memories of American books, authors, engravers, and literary men and things have not been more fully preserved.

But it is not so much the purpose of this article to speak of Mr. Gowans as of his vast collection, which is now scattered under the hammer of the auctioneer.

The stock was probably the largest of the kind in the world. We do not know of any such accumulation elsewhere, although we have examined many of the great collections in the hands of booksellers. There were many more valuable collections, but none so large, and probably none so wholly without arrangement. The stock was contained in a Nassau Street building, on the first floor, the basement, and a sub-cellar. The floors were nearly two hundred feet in depth from front to rear. Originally the sides were shelved to the ceiling, and two rows of tables ran down the length of the first floor. But as the stock increased it was piled, first on tables, then on the floors, until the mass of books was every where impenetrable, except by narrow alleys running here and there, and at length the piles began to topple over and fall into the alleys, so that the careless investigator was likely to tread on books at every step. The basement was a wonder. There was no gas, and the trusted customer who was permitted to search in its gloomy recesses was furnished with a kerosene lamp having no chimney, and casting a dim, flaring light on vast piles lying in confusion every where, and which, in several parts of the long room, were not less than ten or fifteen feet in thickness. Of course thousands of books were buried out of sight in these masses, and the owner himself knew little of what he possessed in his great catacombs.

The contrast between such a place and the old bookstores of Europe was very great. Colbacchini, in Venice, has a long row of rooms in an ancient palace, and the rooms look almost like a palace library. Weigel, in Leipsic, has his splendid collections arranged on shelves in stalls, so that each book can be found by catalogue in a moment. Most of the European dealers keep their old books invisible to customers, expecting to

sell by catalogue exclusively, or to bring out and show all the books of a particular class which may be asked for. And the dealers of Europe are generally careful in their purchases, so that their stock contains but little that is trash. Our old friend in New York had grown up from selling in the street-stall, where second-hand school-books and all kinds of cheap literature had their value, and he had never lost the habits of trade in which he began life. So he had an immense amount of print on hand, which damaged instead of adding to the salable value of the white paper. For every book which was worth keeping there were five or ten that should have been sold to the paper-dealers.

But, for all that, there were treasures in that Nassau Street cellar which were worth hunting after, though it was work to hunt for them. It was like excavating in old ruins. One could never tell what would turn up, and now and then it was startling to see the jewels that came out of the heap.

Like all lovers of old books, we had a special line of collection; and it happened to be one in which no catalogue could aid us. Until the late publication of the South Kensington Museum "Universal Catalogue," there had been no attempt to make a complete list of books of the sort we desired; and let it be noted, in passing, that this catalogue is worse than none at all, and may be set down as the greatest waste of paper and printing-ink which has hitherto been made in the line of catalogues. For years past we have devoted considerable time to searching through the stock of Mr. Gowans for early works of art, and we found not a few.

There are a great many old articles of value in America. For in the seventeenth and eighteenth centuries among the emigrants to these shores were many families who had been wealthy, and who brought with them a few old treasures, in books, or pictures, or articles of virtue. These treasures remain here, scattered about, and sometimes they come to the auction-room, or are brought to the dealers. The accumulations of a New York dealer in a long life devoted to the business may well happen to contain rare gems. During the last twenty years many libraries have been brought to America, and very many books for American collectors. It is a somewhat curious fact that many Americans, especially young collectors, enjoy the plan of selling their collections and beginning again. So, too, it happens that in our fast and changing life, full of ups and downs, the wealthy man of to-day may send his treasures to the auction sale next month, and they vanish into all sorts of old shops and out-of-the-way places. Many modern emigrants, too, bring articles of no small value. We have before us now a pencil sketch, which, if indeed genuine, is of the highest interest, since it is a head of old Michael

EXTRACT (REDUCED) FROM DÜRER'S TRIUMPHAL ARCH.—[SEE PAGE 393.]

Wohlgemuth, on very ancient paper, with the monogram of Dürer, and the date 1489. It belongs to the collection of a gentleman in this city, and was obtained by him from an old German house-decorator, who stated that his father found it pasted on the wall of a room in Nuremberg among many other drawings and engravings, which were torn off in repairing the house.

Few persons imagined, and perhaps still fewer cared, what a mine of value and interest was in the Nassau Street cellar, or what great thoughts of great men, poets, theologians, reformers, artists, lay concealed in the heaps of books.

Many collectors and many learned men remember the library of Dr. Kloss, of Frankfurt, which was sold at auction in London so long ago as 1835. It somehow occurred that a large part of this library came to New York, and was resold here, and enriched numerous collections. A considerable number

of the books were bought by Mr. Gowans. In excavating the heaps in the basement we came on not a few of the books of Dr. Kloss, each having his book plate. They were honorable books, not in their own age and character alone, but for their associations and old companionship. They were once part of a great collection, and stood on shelves by books that were priceless for their histories. Dr. Kloss was a great collector of early typography, and became, apparently without knowing it himself, possessor of the books of Philip Melancthon, a large number of which were crowded with marginal notes in the reformer's autograph. The library of Melancthon probably descended to his son-in-law, Peucer, who afterward edited his works. Peucer was imprisoned for eleven years, on some charge, and when liberated found that his wife was dead, and his library and property gone. The books remained mostly together somewhere, no one knows

where, until they fell into the hands of Dr. Kloss. He had also, as he states in a letter published in the sale catalogue of his library, purchased many other great libraries. He had bought all the books of John von Dalburg, Bishop of Worms, of Bernard Adelman, and of the cathedral of Esslingen. Out of which of these collections came the volumes in the Nassau Street store it is now impossible to say, for it is too late to inspect them. We have several of them before us as we write, but these contain only the book plate of Dr. Kloss. One is a very beautiful and perfect specimen of the typography of Herman Bongart, of Cologne. It is without date, but Bongart printed in Cologne at the close of the fifteenth century, and printed well, too, for the type of this book is clear cut old black-letter, and the red and black ink shines as bright and pure in color to-day as when it was impressed nearly four hundred years ago. The book is a Flemish translation of Thomas à Kempis, "*De Imitatione Christi*"—a rare edition, and probably the first in this dialect. The pious printer, at the end of the register, or table of contents, says, "*Orate pro impressore unum Ave Maria,*" and doubtless secured by this means the prayer of many a devout reader of the book, which has always been highly esteemed by good Christians of every denomination. It is in a peculiar dialect. The title commences thus: *Dyt is eyn kostlich devoit boecken*, and it is said to be translated *us dem latin in guden dutsschen*. Early editions of the "*Imitatione*" are always prized; but we have not been able to find this described in any of the numerous works which profess to give lists of the various editions.

We have, however, one interesting volume, which, although found in Mr. Gowans's collection, and not coming from the Kloss library, seems to have belonged to Melanchthon, and to be enriched with his notes. It is a Theophylactus, the Basle edition of 1524; interesting on other accounts also. It is well known that Melanchthon was in the habit of making numerous notes on the margins of his books, and that his friends, who were enthusiastic in love and admiration for him, would often persuade him to give his annotated copy in exchange for a new one, which in its turn would soon become rich with his autograph. The present volume is thickly annotated in red ink on the first sixteen folios, after which occurs only here and there a note in black ink, as if the latter had been made in a first cursory reading of the volume, and then the red-ink notes, full and frequent, in careful study; but the book was probably given away when he had gone in this study only so far as the tenth chapter of Matthew.

This edition of Theophylactus is otherwise interesting for its typography. It contains some of the same ornaments and initial

letters which Dibdin and others have made famous—found by them in the Polydore Virgil of 1534—and among them the celebrated group of the farmer's family chasing the fox which has stolen the goose. This cut, which forms part of a title-page border in some books, is used in the Theophylactus as the head-piece to a chapter. The book is worth the special attention of lovers of old woodcuts on account of the title-page, composed of four blocks, each marked with the letters I. F., and the other illustrations from the same hand. This I. F. was one of the best artists on wood of that period; and from the presence of these cuts (some of which are unknown to any writers on art) in a book of Cratander's, in 1524, it would seem hardly possible that he could have been, as sometimes supposed, John Froben.

We found Peucer's edition of Melanchthon, a superb set of old folios, in Nassau Street, each volume containing the fine full-length portrait by Lucas Cranach, and the small half-length portrait, also by Cranach, on each title-page. There was a warm personal friendship existing between the artist-burgomaster of Wittenberg and the two great reformers, Luther and Melanchthon. Cranach painted and engraved their portraits repeatedly, and there is no extant likeness of Melanchthon more speaking than this full-length wood-cut. What an age that was when the Reformation was shaking Germany! All ages have their arts and inventions; but no age had more to boast of, and, curiously enough, no city more than old Nuremberg, when Melanchthon went down there and contracted his warm friendship with Albert Dürer. There was much that was congenial in the characters of the two men. Little as we know of it, there was a very brilliant circle in the old Bavarian city just about that time, and the whole world feels their influence to-day. Recall the exquisite iron-work of Peter Visscher and the sculpture of Adam Kraft, and Peter Hemlein inventing the Nuremberg eggs (the first pocket watches), and John Schoner making the first globe of the world, and Hartman discovering the variations of the compass, and a score of others, all living and working in the first half of the sixteenth century in one city. Above all, think of Albert Dürer, the man who made the first epic pictures, who reformed art, and gave birth to the glory of the German school.

We found him in the Nassau Street shop; for we found a copy of "*Alberti Dureri clarissimi pictoris et geometræ: De symmetria partium in rectis formis humanorum corporum; Libri in Latinum conversi.*" This is the work on which Dürer was engaged, and which he had ready for the press when he died, in 1528. The first edition, containing four books, in German, was published for his widow in that same year; but this second edition, in

Latin, containing only two of the four books, was not issued until 1532, and it possesses a certain peculiar interest in connection with Dürer's married life. As we opened it by the flaring light of a kerosene lamp, among the heaps in the Nassau Street basement, we were carried back to a history which has as much of emotion as any that the lives of the great artists have ever furnished us; for this edition was published at Nuremberg in 1532, *in ædibus viduæ Durerianæ*. So it seems that Agnes continued the publishing business in the old house at least four years after Albert had been carried along Adam Kraft's Via Dolorosa to the cemetery of St. John.

Writers on Dürer have generally been content to accept an old story, from a worthless source, as the account of Agnes Dürer's life with her husband, and drop all mention of her after his death. So we seldom find any account of her after-life beyond the fact that she inherited all that had been the property of the artist.

No woman has been more vilified in history than Agnes Dürer, and none, we are persuaded, more wrongfully. She may have been worse than she is represented, but there is no evidence of it; and until we have a better witness against her than Bilibald Pirkheimer she should be regarded as a loved and lovely woman. It is strange that so many admirers of the great master who have written concerning his life have been content to follow this old story, told by a man notoriously unfit to express an opinion about a virtuous woman, and do not seem ever to have entertained a notion that his accusations were unworthy credit. If he were otherwise credible, it would tell much against him that he should volunteer to a stranger a sharp tirade against the character of a woman with whom he confesses his relations have been always unfriendly. What business had this fat egotist to write such a letter about a woman at all? If he would be guilty of such a letter about the wife of his friend, we can well believe that he would not stop at falsehood.

Let us gather all the testimony which exists on the subject of Agnes Dürer's character, and we shall find that Bilibald Pirkheimer is the solitary witness against her. Upon analyzing his evidence, we find this to be the state of facts. After Dürer was dead, Pirkheimer had occasion to write a long letter to one Tcherte, in Vienna; and, alluding to Dürer's death and his own relations to him, he breaks out into a tirade against Dürer's widow. He says, in substance, that she had always regarded him as her enemy, and that since Dürer's death she would not see him nor have any thing to do with him; he ascribes Dürer's death to her, says that she worried him always, and the specific effect which he charges her with producing was that Dürer was dried up, and did not dare

to go into society or indulge in gayety. He had often expostulated with her, and told her that she would kill her husband by keeping him so closely at work. But he only met with her ingratitude; for whoever was a friend of her husband's she regarded as an enemy. In this same letter he complains that Agnes had disposed of a pair of stag's antlers, and many other fine things of Dürer's, which he had wanted, but she sold them for a mere trifle, and did not let him know.

Here comes in a suspicion. If Agnes loved money so much, why throw away these fine things? And, again, what is Pirkheimer's motive in writing all this tirade about his friend's wife and himself to a stranger? for Tcherte appears by this very letter to be a new correspondent, not an old friend. Above all, who was this Pirkheimer, and what his character, that we may weigh his testimony against a woman, a widow, and the widow of his friend? In this same letter he tells Tcherte that she and her sister are pious and honorable women, but that he would prefer to have business with a loose woman rather than with such a scolding, fault-finding, pious woman. Now Pirkheimer, as we know from abundant evidence, had much familiarity with loose women. Beyond dispute, he was a fat, sensual man, given to free life, denying himself nothing on the score of morality, and both in his correspondence and his intercourse with Dürer seeking to make him the confidant of his adventures, and receiving always admonitions in return, given sometimes sharply and sometimes in ridicule. His character was such that we are fully justified in regarding him as unfit to express an opinion in regard to a pure woman. We will take his testimony, therefore, only for what it is worth, and out of his own story of his relations to Agnes Dürer construct a history which seems far more likely to be the true one than this which has generally been accepted from his tirade.

Dürer and Pirkheimer were friends in boyhood. The latter was rich, and of high rank in the old city; the former was poor, the son of an honest goldsmith, who had counted no less than eighteen children in his family, most of whom, indeed, had died in very early life. As they grew up the friendship continued; but while the artist was driven to hard work for his bread, the rich man devoted his life to luxury. Dürer married a young girl of good family and of great beauty. He needed just such a wife as she proved. Her influence on his life was all for good. Pirkheimer grew to be a dissolute man, and Dürer had hard work to resist his constant desire to carry him off from his wife and his studio to join in "gayety." Then commenced the differences between the artist's wife and his friend. We can plainly see what he means when he writes to Tcherte

BILIBALD PIRKHEIMER.—[FAC-SIMILE OF CUT BY TOBIAS STILMMER, AFTER DÜRER.]

that she prevented Albert from going into society or indulging in gayety. The sort of society and gayety which Pirkheimer desired him to enjoy is abundantly evident from his correspondence when the artist was in Venice. The young wife had a more powerful influence on the artist than his old friend and all his alluring temptations. The result which came about is just what we often see in modern life. The friend of the man takes a strong dislike to the woman who wins the greater influence, and the woman never can forgive the man who wishes to draw her husband from her to low and vile associations.

There is a story, founded on Pirkheimer's tirade aforesaid, that Agnes used to sit above her husband's working-room, and keep him at his work by speaking through a hole in the ceiling. Absurd as this is, we can imagine its origin. If such a hole there was, we have little doubt that sometimes, when Albert was bored to the last extreme by such lazy loungers as Pirkheimer, stupid from last night's excesses, and not able to see that his friend wanted to be at work, Agnes would come to his help by calling out, "Albrecht, are you alone? I am coming down to see you." We would take our affidavit that through that hole in the ceiling a thou-

sand kind words went up and down, and never one either way that was not loving.

Dismiss Pirkheimer and his libels from our minds, and we may construct for Dürer a home full of all that was beautiful and lovely. He had his mother, and it was the delight of his life to care for her in the lonesome years of coming age; his young brother, whom he watched and guided with tender anxiety; above all, his gentle, beautiful, and faithful wife, whose face is the Madonna that he best liked of all his works, always with him, always enjoying with him those wonderful conceptions of the beauty and grandeur of the unseen world, those exquisite home ideas of the life of the Virgin mother of the Lord, sharing constantly his every thought of earth and heaven.

But we are not disposed to deal with imaginations now. We prefer a plain discussion of known facts.

There is a great error, and succession of errors, in which writers have followed one another like a flock of sheep, concerning Dürer's letters to Pirkheimer written from Venice in 1506. The first mistake is made in regarding it as strange that he so seldom mentions his wife, and that his few messages to her are so cold. Enough, in reply to this, that he knew his wife's opinion of Pirkheimer, and their established dislike, and he therefore exercised discretion and judgment in his correspondence.

In substance, he is to be understood as saying, "You and I are friends, but let my wife alone." Curious blunders are made by all translators of the queer old Bavarian dialect in which he writes. One serious blunder occurs in the latest English book—a very good book, too—Mrs. Heaton's—where the meaning of a sentence is wholly changed. Pirkheimer had spoken in his coarse way of many persons and things, and, among others, had for once ventured to speak of the artist's wife. His remark was, in effect, that, if Dürer did not hasten home, "I will make love to your wife." The word which we translate "make love" is capable of several translations, conveying a coarse idea, or a more common signification—tease, annoy, torment. Dürer's reply is short, sharp, and

distinct, but strangely mistranslated by Mrs. Heaton, by Scott, and by others. He does not say, "You may keep her till death." He never wrote such a brutal sentence. But he replies, simply, "This is wrong; you will bring her to her death." The only meaning properly to be extracted from this is a reproof as sharp as he could use to his creditor, to whom he was then under heavy obligations, and unable to pay. Neither is Agnes the "reckon-mistress" named in these letters. On the contrary, coupled as this "reckon-mistress" is with women of loose character of Pirkheimer's acquaintance, she is clearly one of them, and no one should have dreamed that Dürer joined his wife and such persons in one sentence.

Her reputation as a saving person is to her credit, since we have abundant evidence that she was not niggardly, Pirkheimer to the contrary notwithstanding; for she never seems to have restrained Dürer in his free purchases of curiosities and objects of taste in art, and the furniture of their home was luxurious and elegant for the period. Many a money-lender has found an artist's wife much more careful to compel exact and honest dealing than the free and careless artist, and has thence taken deep offense.

We know so little of Dürer's private life, have such very brief extracts from his journals and correspondence, and possess so little on which to construct his home life, that every one seems to have seized on Pirkheimer's letter to Tcherte, and thereon founded the current theory about Agnes, interpreting every possible suggestion by this false light.

We know absolutely nothing about the family life in the old Nuremberg house, save only that Dürer lived at home and found his pleasures there. And from that old home at length Dürer "emigravit," as saith the record on his tomb—went away to another and fairer country, where many of his dreams became realities of glory. No record is left us of the later hours of his life, in the gloom that was settling in the artist's chamber. We may believe, if this miserable libeler, Pirkheimer, can be kept silent while we imagine the scene, that those last hours were full of tender and holy conversation, not unmingled with lookings forward to a reunion. It was doubtless agreed that they two would rest together until the resurrection, for he was laid in her father's tomb.

Then she was left to the world and her memories of the man who, more than all other men, had taught Germany to love the beautiful, and filled it with that exceeding splendor of light which to this day characterizes German art.

As soon as they had laid the artist in the grave, Pirkheimer sought to possess himself of the treasures of art with which he had been surrounded. They were many and

valuable. The incident of the stag's horns is but one. There were other beautiful things, as we know, and as Pirkheimer says to Tcherte, and Agnes did not let him have them. Why should she? He had always been her traducer, had long sought in vain to sow discord between her and her husband, and she had good right to have done with him thenceforth forever. Doubtless she very plainly gave him so to understand, and distributed the memorials of the artist among those who could share with her the memories of an affection that had always been offensive to the man who had so much and so long vilified her. Then the ire of the fat patrician arose, and he went storming around Nuremberg, telling all men that if Dürer had only drank more wine and eaten more suppers and lived a gayer life with him, he would have lived longer. And this being his prominent sensation at the time, he can not resist the temptation to put it in a letter to Tcherte, a stranger to whom he had occasion to write; and the letter survives to darken the memory of Agnes. Thus the evil that this man did lives after him.

This book, which came from the *adibus* of the Dürer widow, carries one directly to the old house at the corner of the street as you come in at the gate-way from the cemetery. It was not the same place when the book was printed that it used to be: the same, indeed, in stone and plaster and timber, and, for that matter, it is the same now. But the men were gone that used to be there, and, above all, the gentle and noble soul of the artist was gone. That expression, "published in the house of the Dürer widow," may indicate that this same old house was used for the mechanical processes of printing as well as publishing. This is little more than a surmise, but it seems highly probable that Dürer himself had supervised the printing of his engravings, both on copper and wood, in his own house, in which there was ample room for it. Whether this be so or not, there is abundant evidence that there were collections of men of note in the art world gathered in Dürer's house during his lifetime, and his pupils who worked there under his supervision became, in after-days, men of renown as painters and engravers. The Kaiser Maximilian was accustomed, doubtless, to visit him in his working-room, and perhaps sat by while he drew the splendid designs of the triumphal arch in honor of the good but vain old emperor, or the few blocks of the "Triumph" which are from his pencil, among the many by Burgmair. What, when you come to think of it, could be more striking than this—to find in a New York heap of old books a copy of one of Dürer's works, with designs printed from his own blocks, and the book itself sold once by the fair and much-abused Agnes in that old house to which all the world now makes a pilgrimage?

THE EMPEROR MAXIMILIAN.—[EXTRACT FROM DÜRER'S "TRIUMPHAL CAR."]

And then, at another time, we found there the best edition of Pirkheimer's own works (folio, Frankfort, 1610). He has long been forgotten, except as the friend of the great artist. He took care himself to keep alive this relation. This edition of his works contains a description of the triumphal car of the Emperor Maximilian, "invented" by Pirkheimer and published by Dürer, with a copper-plate illustration which was probably engraved by Henry Ulrich. There is a well-known painting in the hall of the town-house in Nuremberg, attributed to Dürer, representing this car. The wood-cut, on

several sheets, which is from the pencil of Dürer, has become rare, though several editions were published. It appears that Pirkheimer made a formal presentation of his invention to the emperor, and received a formal acceptance, dated March 29, 1518. It is probable that the wood-cuts were thus presented, and the painting in the town-hall was afterward executed by Dürer, or his pupils under his direction.

It represents the emperor in a small way, surrounded by the conceptions of the designer in a large way. Maximilian is seated in a gorgeous car, attended by all the vir-

tues. Reason holds the reins of twelve horses, each horse being attended and led by a genius, such as Prudence, Moderation, Alacrity, Firmness, etc. The work is not one of the best of Dürer's, but it has some great features. The copper-plate of Ulrich is feeble, and gives an inadequate idea of the original wood-cut, or of the painting.

In this same collection of Pirkheimer's writings we have a description of a much more important work by Dürer, "The Triumphal Arch of Maximilian." This gigantic work, as published, was, or was to have been, on ninety-two blocks, making, when the impressions were gathered in order, a picture ten feet and a half high by nine feet broad. The execution is in Dürer's boldest and best style of drawing. The history of the work is somewhat confused and uncertain. But it is here described as a "*Porta honoris*," erected in 1515. It is followed by descriptions of other arches, to Charles V. and Maximilian II., erected in Nuremberg. It is, therefore, not impossible that there was actually erected such an ornamental arch on some occasion in 1515 in a street or square of Nuremberg, and that Dürer afterward made drawings, and published them, representing this arch. The title is susceptible of two translations, either that the description is by Stabius, or that the arch was erected by Stabius. We have not space here to discuss the origin of the design, but the work as published is probably the grandest extant triumph of the art of wood-engraving. When we reflect that twenty-five years before its appearance the world had no higher conceptions or examples of the art than were furnished by Schedel's "Nuremberg Chronicles," we may well call this the triumph of Dürer rather than the arch of the emperor.

We found this edition of Pirkheimer bound in the same covers with the works of Marcus Welser, the two making an enormously thick folio, containing in all about fifteen hundred pages. At first we did not observe the second book, occupied naturally with the thoughts of Dürer which the first had suggested, and it was some time before we had even read the title, "*Marci Velseri, etc., Opera*," printed at Nuremberg, 1682. Marcus Velser, or Welser, as the name is commonly printed in English, belonged to the wealthy family of that name in Augsburg, who, with the Fugger family, exercised immense power by means of their great wealth, both in Germany and throughout the world. Bartholomew Welser fitted out an expedition to take possession of Venezuela, which Charles V. had pledged to him for a debt. Marcus, born in 1558, was one of the most learned and accomplished men of his day. He was wealthy, was a senator and pretor of Augsburg, and a great patron of literature and literary men. This volume recalls, by the name and by one of

the engravings, the most memorable event in the annals of the Welser family, and one of the most romantic incidents in royal history. In 1547, when the imperial diet was in session at Augsburg, Ferdinand of Tyrol, son of the emperor, a boy of only nineteen, saw Philippina Welser, then seventeen, the young daughter of the merchant and banker, and loved her at first sight. She was regarded as the most beautiful woman of her time, and her portraits, which abound in the Tyrol and at Vienna, abundantly justify the reputation. They represent her as a girl of very perfect features and clear complexion, with an expression of almost saintly beauty. Ferdinand knew that his father would never consent to a union so beneath his position, and made a secret marriage with the beautiful Augsburg maiden. It proved a happy union, and although it was twelve years before the emperor would see her, she was then so very winning that he yielded at the sight, and acknowledged her as his daughter. If you have ever been at Innsprück, the noble old city in the heart of the Tyrol, you will have visited the church where the bronze statues surround the tomb which Maximilian, by his will, ordered for himself, but has never been brought to occupy, and you will have gone up into the silver chapel and looked at the monument where the beautiful Philippina lies in marble on the tomb which holds her dust. This tomb is represented in the volume of Marcus Welser's works, and the engraving recalls the valley of the Inn, the old castle of Amras, the church, and the statues. It is odd to associate two women like Agnes Dürer and Philippina Welser; but here, in one volume, are the works of Pirkheimer, who made the one to be celebrated for parsimony, and the works of Welser, preceded by his life, in which the editor gives the history of the other, who went from the old city of Augsburg to a throne.

Pirkheimer's works abound in letters to and from Erasmus. There was no author of the sixteenth century whose works appeared in greater luxury of typography than those of Erasmus of Rotterdam. He was intimately associated with his friend Frobenius, the Basle printer, and was, indeed, corrector of the press to that celebrated publishing house. Froben always made superb books out of the works of Erasmus, whatever the subject might be. But Froben scarcely ever equalled an edition of Suetonius and other Latin authors, "*Ex Recognitione Des. Erasmi Rotterodami*," which was published at Cologne by Encharius Cervicornus in 1527. We found it in the Nassau Street collection. It is especially noteworthy on account of the superb series of initial letters, commonly known as "the playing boys," and also for other ornamental letters almost as fine. In the "*Holz-schnitte Berühmter Meister*," etc., of the late

INITIAL LETTER FROM THE "PLAYING BOYS" ALPHABET.

Rudolph Weigel, Leipsic, 1851-54, under the *Deutsche Schule*, Albrecht Dürer, No. 36, we find two letters of this series, A and F, attributed to Dürer; and on the F the well-known monogram of Dürer appears on an apple in the corner. It looks as if there were some error about this, for we have frequently found the F without any such mark, and never with it; nor does the style of work in the letters fully assure us that they were Dürer's. Nevertheless, they are very fine, and serve well to show the splendor of the typography of the period. Ornamental letters and ornaments of pages had been continued in typography from the earliest dates in the art, when they were introduced, because printing was an imitation of manuscript, and printed books were made to look somewhat like the old manuscripts. The ornaments which were engraved on wood were far in advance of the wood-cut illustrations in the early books down to the time of Dürer, and after his reform of the whole art of illustration the advance in the style of these ornaments kept even pace with the improvements in general illustration.

We found also an edition of *Livy*, with a

well-known page by Erasmus, which is interesting on several accounts. It is a magnificent specimen of typography, ornamented with some very fine borders, and especially with curious initial letters of various kinds. Its chief value, however, is derived from the fact that it was printed at Mayence by John Scheffer, the son of Peter Scheffer, who was the partner, and married the granddaughter, of Faust, and whose later descendants claimed that he not only worked with Gutenberg, but was himself the inventor of the art of printing with movable type. The body of the volume was published in 1518, and is followed by an exhaustive index, printed a year later. This index is enriched with a prefatory letter from Ulrich von Hutten, dated 1519, and a page bearing the same date which commences thus: "Erasmus Roterodamus, miso-barbaris atque iisdem philomusis omnibus, S. D." This page is the well-known eulogy of Erasmus on the invention of printing. There is yet another page in the volume, by Nicolaus Carbachius, to the reader, which also contains matter of interest on the subject of the invention of the great art.

There is some little confusion among the modern accounts of the Scheffer family. We have adopted the orthography of the name from the *Livy* before us. It was otherwise printed Schoiffer and Schoeffer. Faust, or Fust, having foreclosed on poor Gutenberg, did well to secure as his working partner in the new art the young Peter Scheffer, who knew more about it than any other man except Gutenberg. Faust had a son Conrad, who had a daughter Dinah, whom in after-years Peter Scheffer married. Our printer of the *Livy* appears, therefore, to have been the son of Peter Scheffer, and the great-grandson of Johan Faust.

Carbachius, in the page to the reader, speaks of John Scheffer: "Calcographus, a cujus avo calcographice in hoc primum urbe inventa exercitaque est." Erasmus, more cautious, and having, doubtless, known personally the elder Scheffer, who did not

ORNAMENTS OF PAGES (REDUCED) FROM BASLE BOOKS.—[ABOUT 1530.]

die until about 1503, speaks of John Faust as the chief among the discoverers. In an earlier edition of Livy, John Scheffer himself, in some German verses, distinctly states that the art was invented by Gutenberg, and carried on to perfection by Faust and Scheffer.

There is, however, a distinct interest in this book, owing to the fact that it has a brief and characteristic preface by that odd, accomplished, reckless, learned, and wild author, poet, and knight, Ulric von Hutten. Just to see a book containing two prefaces, one after the other, by these two men, Erasmus and Hutten, in 1519, calls up at once the days of the *Epistolæ Obscurorum Virorum*, when Hutten's sharp and coarse wit did such service in the Reformation, and when he and Erasmus were friends before the latter had quarreled with him and forbidden him his house. Why will not some one give us a biography of this strange and wonderful

INITIAL L.

man, around whom there lingers so much that might be called the romance of the

ERASMUS.—[BY DEUTSCH, AFTER HOLBEIN.]

Reformation, and also the romance of learning and literature? Even his portraits, existing in contemporary wood-cuts, are very scarce. He was in face and form a contrast to Luther and Erasmus, and as great a contrast to the slender Melancthon. It often-times appears as if there were a certain spiritual look on his countenance, which makes one think it would have been pleasant to pass a summer day with the sometimes gay and sometimes very sad knight in the castle of his friend Franz von Sickingen, which Hutten called "The Bulwark of Righteousness." Many biographies have been given to the world, but few serve to make us acquainted with men as members of the social world. A skillful hand might work out a great book, taking Ulric von Hutten as the central subject, and introducing the men and scenes of the beginning of the sixteenth century, Protestant and Catholic, among which he moved.

That early part of the sixteenth century was a stirring time for Europe, physically as well as morally. While Dürer was at work in his studio, and Marc Antonio was copying his plates in Italy, and Michael Angelo and Raphael were winning immortal renown in Rome; while Erasmus was deep in his studies at Basle, and Luther was fighting the first battles of the Reformation all along the way from Worms to Wittenberg—the last great storm was gathering in the Eastern world, around the island of Rhodes, where the great order of St. John had been established for two centuries, and threatened still to restore by some new crusade the Christian kingdom of Jerusalem, which had been lost on the fatal field of Hattin. The Turks were gathering their energies to drive the Cross from the Levant, and at length the tempest burst over the island, and in the year 1522 the contest, which had not ceased since the days of Saladin, was fought to a conclusion, and the Crescent triumphed.

Books describing events of importance, published at the time of their occurrence, possess a charm fully equal to that of the most fascinating romances. We found in the Nassau Street accumulation an old French book, to read which was like opening the graves of the mighty dead, and talking with them face to face. It was "*La grande Merueilleuse et trescruelle oppugnation de la noble cite de Rhodes*," etc., etc., by Brother Jacques, Bastard de Bourbon, a book which was printed in Paris "pour honneste personne Gilles de gourmont—lan mil cinq cens xxvi. au mois de May;" and bound in the same covers another edition of the same work, "*Augmentee tout selon le vray Imprimee par le commandement dudit Seigneur—lan mil cinq cens vingt et sept, le premier iour Doctobre.*"

The first edition of this book (of 1525) has been catalogued at 400 francs in Paris.

Those of 1526 and 1527 are scarcely less rare. The colophon at the end of the edition of 1526 will convey some idea of the manner in which the events recorded in the book then impressed the mind of the Christian world in Southern Europe. "*Cy finist ce present livre, intitule, le siege, oppugnation et prinse de la jadis honnoree et maintenant povre desolee et captive cite de Rhodes (apres avoir prospere deux cens et quatorze ans en honneur), assiegee par le mauldit et sanguiinaire sultam sellimam a present grand ture enemy de la foy chrestienne.*"

It was in its day the fresh, thrilling history of that siege, and long resistance of the brave knights of the ancient order, which will be forever memorable.

A wonderful siege, and a wonderful defense! Still, in our own day, soldiers study with profound admiration the story of bravery illustrated in that contest, and the lover of romance, when by chance he takes up one of the volumes of Vertot, or, better still, picks out the old French of the Bastard of Bourbon, acknowledges that no fiction contains more brilliant achievements, no work of imagination surpasses in splendor the deeds of the Knights of St. John in the defense of Rhodes against the Turks. Deserted by the Christian world, which had promised to sustain them, after incredible feats of valor, they surrendered when resistance was not only vain but impossible, and on the 1st of January, 1523, abandoned the island to the misrule which curses it even until our day.

These pages, found in the Nassau Street heaps, were exciting enough in their day. Those who read them in France in 1526-27 knew by name the heroes, as we know the men of our own civil war. Turning over the leaves now, we catch the names of Villiers de L'Isle Adam, the brave Grand Master, Pierre de Cluys, the Grand Prior of France, Mery Gombauet, Didier de Toulon, and many others, that sound like the names in old romances which we read years ago; but they had the ring of truth when this ink was fresh, and each one of these heroes was renowned in Europe. It makes them real personages to read in contemporary print how these and "*plusieurs autres commandeurs et chevaliers gens de bien deliberez de viure et mourir tous a la dicte breche.*" It meant something then and there when knights and soldiers of the order resolved to live and die in the breach.

We were not a little surprised one day at the discovery, in the basement heaps, of a wood-cut, published in 1552, representing a boat propelled by oxen turning wheels. Without having looked into the subject, we had always imagined that the idea of driving boats in this way was only a little older than the invention of the steamboat. Here, however, was very clear evidence of the greater antiquity of the notion. It is in a folio

BOAT PROPELLED BY WHEELS.—[FAC-SIMILE OF A WOOD-CUT OF 1552.]

volume entitled, "*Notitia utraque cum orientis tum occidentis ultra Arcadii Honorique Cæsarum Tempora*," etc., published by Froben at Basle in 1552, and the boat is ascribed to ancient Roman times. It is said to be a war vessel, what we call a ram, propelled by oxen turning the wheels, and intended to run down or sink the vessels of an enemy. The projecting prow or ram's head, designed to pierce another vessel, is under water, which has also been thought a modern idea. There is a curious old cut of a vessel with a wheel in the splendid Como edition of Vitruvius, printed by Da Ponte in 1521, which has sometimes been mistaken for a boat propelled by wheels, whereas it is a ship under full sail, and the wheel is placed on her side to measure her velocity and the distance traveled. The book of Froben is curious also on account of many quaint and remarkable engravings, which have a monogram mark ascribed by Brulliot, on the authority of another author, to one George Scharffenburg. But Brulliot, with all his researches, had never seen this book, and it may, therefore, be regarded as somewhat rare. As early as 1482, in a book printed at Verona, in Italy, there is a representation of a boat propelled by wheels, and we have discovered another in a Vitruvius of 1523.

Lying in a mass of books without covers,

we picked up, one day, a small quarto of 530 pages, lacking title-page, which Mr. Gowans, or some former owner, had judiciously marked in pencil, "A medley of wonders." It was easily recognized as the "*Officina Istoria*" of Astolfi, especially as it contained the *Aggiunta*, with the catmark of Sessa, and the date 1605. Here was a volume which, by a series of facts connected with it, took us at once into the great art school of Venice when Titian Vecellio was in his glory, for it contains woodcuts which have been claimed as his original work. Cæsare Vecellio was an engraver in Venice, who published in 1590, and again in 1598, a book of costume prints, entitled, "*Habiti Antichi et Moderni di tutto il Mondo di Cæsare Vecellio*." Another edition of this work was published in 1664, in which it was stated that the cuts were drawn by Tiziano Vecellio for his brother Cæsare. Meantime, between the publication of these editions, many of the cuts were used by Sessa to illustrate the "*Officina*" of Astolfi. Incredulous readers might well be startled at being told that many "original" works of Titian were lying in a New York shop. But it may easily be true, though some doubt has been cast on the story, from the fact that Titian died in 1576, a man of only one year less than a century old, and Cæsare's book

A VIRGINIA LADY.—[BY VECELLIO, 1590.]

was not published until some years later. Nevertheless, the account in the edition of 1664 has many believers, and the cuts have been frequently described as drawn by Titian. Astolfi's book is a curious medley, and would furnish material for a long and amusing article. There were not many men or women known to history or story in his day who did not find places in the book as examples of one or another class. It might be entitled, *Anecdotes illustrating Character of Men and of Women*. Honest men, chaste women, men of great memory, suicides, robbers, pirates, brave men, arrogant persons, witches, and necromancers—these are but specimens of the classification of historical incident, divided into ancient and modern examples, which crowd the book, and which are gathered not only from the Old World, but from what little was then known in Europe of the Western continent.

One of the cuts, which in Vecellio's "Habiti" represents the *Habito delle donne dell' Isola Virginia*, does service in Astolfi to illustrate the *Honori della povertà*. The book seems to contain some other cuts by Vecellio which are not to be found elsewhere. Sessa's cat-mark, in a dozen forms, is well known to all collectors of old books, and it used to be thought safe to purchase any book bearing it, since all his issues had value.

Whether Titian ever drew on wood for engraving was long disputed, but it is now well settled that he executed some drawings on large blocks, impressions from which are highly esteemed. That he amused himself in his extreme old age with some of these costume prints for his brother or relative is not impossible. There was not much originality in some of them, which are copies of older works, but a large portion of them are new in Vecellio's book. It is uncertain whether he copied from Franco, or Franco from him, for this artist produced a set of costume plates on copper, which were gathered in a book, now excessively rare, entitled "*Diversarum Nationum Habitus Centum*, etc., opera Petri Bertelii, Pataviæ, 1589," and another volume, entitled, "*Additio ad duos superiores libros de habitibus diversarum nationum*," which has a preface by Berteli, dated 1591. A comparison of the books, as they lie together before us, leads to the curious question how far the artists on wood and copper may have compared notes while getting out

from presses, not far apart, the two sets of costume pictures in publications which were practically contemporary. They represent

MARK OF THE PRINTER SESSA, OF VENICE.—[FROM ASTOLFI.]

in the main the same costumes, and sometimes with very close resemblance to each other. Both books are now highly prized, and that of Vecellio has been reproduced in France in fac-simile at great expense.

Very many early wood-cut illustrations were turned up among the masses in the Nassau Street basement. We found abundant proof there that Holbein did not design the "Icones" attributed to him, for we found the designs of the "Icones" in Bibles published long before the Lyons cuts, and by subsequent investigations learned that these designs were old in Italy, France, and Germany, and had been growing and developing in the hands of various artists for a long time before their appearance in the little Lyons volume.

The reader, of course, understands that this is not an article on old books in general, but that its object has been to give, by a few examples, a very incomplete idea of the accumulations of one old New York shop. A European collection of the same kind would have furnished many books more rare and curious, but no collection could give us any more interesting subjects of thought in art or history. We have found among the books in this New York collection the issues of some of the most celebrated presses in the world, and the works of many of the most eminent artists. We found there wood-cuts or engravings of Michael Wohlgemuth, Urse Graff, Albert Dürer, Hans Baldung Grun, Hans Burgmair, Hans Brosamer, Hans Holbein, Hans Schauffelein, Springinklee, Solis, Stimmer, Von Sichem, Londerseel, and many others of the German and Dutch early schools; Æneas Vico, Benedetto Mentagna, Cæsare Vecellio, Anibale Caracci, Giacomo Franco, the much disputed Zoan Andrea—where shall we stop in the catalogue of Italian artists, whose engravings adorn old books? The companionship of old artists in such an establishment is something wonderful. There were books which Peter Scheffer himself had handled. There were sermons of Luther, printed at Wittenberg, with title-pages by various artists. There were hundreds of autographs, dated in the sixteenth century, of men who owned and loved the books three hundred years ago. Only looking at such books is like talking with the readers as well as the authors. We can imagine the smiles that stole over faces in those old centuries when they read passages at which we smile now, and some of the stains on old books are tear-drops.

We have only named here and there a curious book, of antique interest, among the thousands in Mr. Gowans's possession. Our own collection has been enriched with many. Others which were not in the line of our pursuit have been sold under the hammer, at prices ridiculously low. Think, for instance, of the works of Justus Lipsius, con-

taining the treatise "De Cruce," with splendid impressions of the engravings, selling, as it did the other day, under the hammer of Messrs. Bangs, Merwin, and Co., for fifty cents; or a fine copy of the old English translation of Eusebius and Socrates and Evagrius, the ecclesiastical histories, Field's edition of 1619, sold for one dollar and some cents!

It has been our purpose in this article to confine our notices strictly to the books we have found in one New York bookstore. We could add to the list a hundred volumes of equal and similar, or superior value and interest found in the same place, but we have only followed from one to another as the suggestion led, and enough has been said to answer our object in showing to American readers what treasures are at hand in New York for those who choose to hunt them up. We could name a few books picked up in Mr. Gowans's store which have no general interest to the public, but which would bring enormous prices in Europe on account of their rarity.

Similar collections, though not on so large a scale, are found in other American cities. We bought a few books some years ago in such a shop in Philadelphia, paying very high prices for them. One of these books needed rebinding, and as the original covers were old, we subjected them to the soaking process. The result showed that the boards were manufactured from the printed sheets, unfolded and uncut, of a rare old book. We obtained, of course, only a portion of the volume, but that portion was valuable. The book is entitled, "Richt way to the Kingdome of Hevine is techit heir in the comandis of God, in the Creed and Paternoster, in the guhilk all Chrissine men sal find," etc., etc. We did not find this title, which we copy from Lowndes, but we rescued one hundred and twenty-eight pages, including the colophon; and forty-eight duplicate pages, also including the colophon, which is "Prentit in Malmw. Be me Jhone Hochstratten the xvi day of October MDXXX." Where and what is *Malmw.* remains unknown, since it is not Malmo, and, probably, not Marlborough, as by some supposed; but the book was sold in the Chalmers sale in 1842 for £10 15s.; and there "supposed unique—no other copy known." So that a Philadelphia book-shop turns up two fragmentary copies of a rare Scotch book by John Gau, of which, heretofore, but one copy was known, and which has been so highly esteemed as to be reproduced in fac-simile in the "Bannatyne Miscellanies."

That this article shall not be wholly thrown away, we venture to suggest a moral to be derived from the subject. The time will come when the books and works of art of to-day will be as much desired for historical purposes as we now desire those of three

centuries ago. Already we miss many such objects, lost out of reach, though published only within the century. The British Museum preserves a copy of every publication made in all the world. America should, at least, collect and keep American books and engravings, and New York should do the work. In turning over American publications we find engravings marked with the names of artists of the latter part of the last and early part of this century, of whom no record exists, but whose works are among our earliest American engravings. Who can show a collection of their works, or give any idea of the extent to which their labors have influenced the minds of young or old in America? It is not too late to gather these scattered memorials of early art in our own country, and the practical way to do it is for some of our societies to appoint committees, and these committees to advertise for donations, and also devote some time to searches in the book-shops. The desired articles have little pecuniary value now, and those who happen to possess them will gladly aid in gathering them into folios or libraries, where they can be arranged, catalogued, and preserved.

In this very connection we recall the fact that there was one class, chiefly of small and apparently valueless books, which we regarded with great interest, and in which Mr. Gowans's stock was very rich. If not now, the time will soon come when American collectors will seek the books to which we allude. There are three periods in the history of wood-engraving which have prominent importance, and to which the attention of collectors will inevitably tend. The first period covers the origin of the art and its advance to the Dürer period; the second covers the sixteenth century, until its decadence. From the year 1600 to the close of the eighteenth century there was hardly an engraver on wood worthy to be called an artist. The revival of the art in England under the influence of such men as Bewick has already attracted the attention of collectors, and the works of Bewick command high prices because of the great demand for them. Up to the present time, however, it seems to have escaped the attention of American collectors that the birth of the art in this country and its rise and progress were largely due to an American, many of whose works rival those of his contemporary Bewick.

It was always a pleasure to find among Mr. Gowans's books any one illustrated by Anderson, and we gathered many out of the Nassau Street heaps. They will be highly valued before many years. Few Americans are aware of how much they owe to Dr. Anderson, who has recently died at a very advanced age. He was an artist of high ability, and for a long period was the only American wood-engraver of merit. No one need hesi-

tate to place some of his works by the side of Bewick's.

The art of illustration owes much more to wood than to copper or steel. While the gems of copper-plate work bring fabulous prices, and are well worth the money paid for them, it must be remembered that they were always works of luxury, for those only who could afford to buy them. The woodcuts, on the other hand, were for all; and when Dürer drew on wood the story of the Passion, or when Titian sketched on wood the capture of Samson, or when such artists as Burgmair, and Virgil Solis, and Jost Amman, and Mentagna, and Vecellio, and scores of others that might be named, drew their designs on wood, to be carved out and printed in fac-simile, they left us clearer ideas of artistic power than we can ever hope to gain from elaborate works with the burin, or often repeated etchings of acid.

BUILDING A HOUSE WITH A TEA-CUP.

By MRS. S. C. HALL.

"LET it alone, Lucy!" exclaimed Granny Grey to her young visitor. "Why did you remove the shade?"

"Well, dear Granny, only because I really wanted to see it."

"See it!" said the very handsome woman, with whom the aspect of youth yet lingered. "Why, darling, surely your eyes are not in the tips of your fingers? You could see it without removing the shade. You mean, I suppose, you wanted to *feel* it?"

Lucy laughed. In common with all the girls in Woolen Reach—the name of the village in which Mrs. Grey resided—she called her "Granny;" "Granny" was the pet name, the name of love, by which all the young people, boys and girls, recognized Mrs. Grey. Lucy Lynne was one of the good woman's especial favorites. There were steadier and wiser girls in Woolen Reach; but there was not one gifted with a gentler heart or a kinder nature than Lucy Lynne.

"I do not know what I wanted," laughed Lucy; "but you all make such a wonderful fuss about that cup that I thought I should like to know why; and just now, when you had done reading, and closed *the Book*, leaving Mr. Grey's spectacle-case in it for a mark, I am sure you sat for quite five minutes looking at that cup—at least your eyes were fixed on it—and yet—" The girl paused.

"And yet what?" questioned Mrs. Grey.

"Why, though your eyes were fixed on the cup, it seemed as if they were somehow looking beyond it; and then—indeed, your cheeks grew red, and your eyes had tears in them, and I thought, without intending it, you clasped your hands; and you got up and looked at the sheet almanac, and I thought you said to yourself, 'Thank God!'"

"Why, Lucy," exclaimed Mrs. Grey, "what an observant puss you are! I little thought you were watching me as a cat would a mouse."

"That won't do, dear Granny," laughed Lucy. "The cat watches the mouse because she wants to catch and eat it. Now you do not believe that I want to eat you?"

"No, dear child, I never thought you wanted to eat me," answered Mrs. Grey, laughing in her turn; "but I did not think you were so observant."

"I am sure," said Lucy, "there are a dozen tea-cups in the house much prettier than that old thing you lay such store by. Some one said here the other day that the 'willow pattern' was considered very old-fashioned, and in 'bad taste;' and you said it was, and that you hated the sight of it, and would have a new dinner service as soon as your ship came home; but," added Lucy, with a little pout, "that ship is a long time on the seas. As long as I can remember I have heard you talk of what was to be done when the ship came home; perhaps, when it does, Granny, it may bring you a pretty cup to put under the shade, instead of that 'willow pattern.'"

"No," said Mrs. Grey; "not all the cups that ever came from China, even if they were filled with gold, would be half as valuable in my eyes as that discolored old tea-cup of the 'willow pattern,' which I have cared for and cherished for thirty years; and Mr. Grey values it as highly as I do."

"Granny, will you not tell me why," inquired Lucy, "that I also may value it? I know you think a great deal of it, for you always dust the shade with your own hands."

"If you can sit still, Lucy, and listen attentively, it will be a pleasure to me to tell you *why* I value that tea-cup. There! bring your favorite stool to my side and sit down, and you shall hear not an imaginary but a true story, which I hope you will remember all the days of your life."

"You know my husband was a carpenter—indeed, I may say is; though he does not work as hard as he used with his hands, I think he does with his head, and I hear that his power of calculation is clear and rapid."

"Oh yes," said Lucy; "I have heard Mr. Grey say that temperance kept his brain clear."

"I married him when I was very young," continued Mrs. Grey—"some said too young to take the cares of the world upon me; but I thought my husband, who was a very well educated man, would teach me how to bear them—at least that was what I thought and believed; but the real truth was, I loved him very dearly, and if there are faults, we are not inclined to see them in those we love."

"Then," said that saucy Lucy, looking archly up into Mrs. Grey's face, "I do not think, Granny, you love *me* very much, for I think you see *all* my faults, ever so big!"

"My dear one!" replied her old friend, "I hope I see them all, because I am anxious my Lucy should be very perfect; and if her faults were not known, how could they be corrected? And she has just displayed one."

"A fault!" repeated Lucy, opening her great gray eyes.

"Yes; you interrupted me at the commencement of a story you said you wished to hear, and I now feel indisposed to tell it."

"Oh," exclaimed the repentant Lucy, "indeed I will not do so again; I will be as silent as ever you could wish, and as attentive; I did not mean to be rude, dear Granny!"

"Where did I leave off?" questioned Mrs. Grey.

"You said we were not inclined to see faults in those we love," replied Lucy.

"Oh, I remember. Well, dear, we had every thing very tidy and comfortable, and my husband had plenty of work. I did not think it then, but I had cause to mourn it afterward, that though I loved my husband, I was not as careful in my early married life as I should have been of his little home comforts. His dinner was not always ready to the moment, as it ought to have been; nor was the hearth swept and the room tidied up, as it is a wife's duty to see that it is when her husband comes home from his day's work. The hour or two of evening, when the toil of the day is ended, should be the happiest of the four-and-twenty, and can not fail to be so if a household, however small, is properly cared for. During the early days of our married life we never omitted reading a portion of the Testament, and sometimes singing the verse of a hymn, before we retired for the night. Mr. Grey had a beautiful voice," said the old lady, with very pardonable pride, "and, as you know, he leads in the church still. After we had been married about a year, it pleased God to make an addition to our family. That should have increased my dexterity, so that my attention to my child should not have been taken from, but added to, the comforts and pleasures of our home; but, instead of that, my new duties rendered me heedless, and often sloppish. My husband liked to see me trim and neat in my person."

"'Katie,' he used to say, 'I only ask to see your hair brushed and shining, and your apron and cotton gown—as they used to be—clean.' He would often take the broom and sweep the hearth, and make up the fire, and put the white cloth on the table for supper; and though I knew that was what I ought to have done before he came home, yet—I don't know how it was—I did not improve. I had grown rather too fond of gossiping with neighbors who were idler than myself, and carrying my child—who certainly was a beauty—about to have it admired. That was our first baby—our

dear blue-eyed boy. I almost seemed fonder of showing him off than looking after my home. When rich married people don't think as much of each other as they ought to do, they have many other things to look to for happiness; but if the lamp which led the poor to the altar grows dim, the house is dark indeed—the light of their life goes out with it!"

Lucy looked at Mrs. Grey with wondering eyes; for she was the neatest and nattiest old lady you could see any where, and was held up as a pattern to all the young girls in the neighborhood.

"I do not know now how it was, or when it began, but we often forgot to read our chapter. My husband did not continue as good-humored as he had been during our early days, and I did not see how much of that was my fault for not making him comfortable, as I had done at first. He was very fond of our baby, but the poor little fellow grew ill and peevish. He could not bear to hear it cry. When it began to cry, he would take up his hat to go out. The very thing which ought to have sent us on our knees in supplication that our infant might be restored to health seemed to break in upon our prayers; and, instead of the hymn—except, indeed, on Sunday evenings—my husband, who had, as I told you, a beautiful voice, would bring home a new song which he wished to learn, so that he might sing it at the Tradesmen's Club at the Blue Lobster.

"Slowly but surely he began, instead of returning home in the evenings, to attend these club meetings. Then I saw my danger, and how foolishly, if not wickedly, I had acted, in not attending to my first earthly duty.

"One morning—I never shall forget it—I rose determined to get my washing over and dried out of the way, as he had promised to return early. There is nothing, except a scolding wife, more miserable to a poor man than finding the fire from which he expected warmth and comfort hung round with steaming or damp clothes that a brisk, good manager would get dried and folded before his return.

"I had made such good resolutions; but, darling," said Granny, after a pause, "I trusted to my own strength. I did not then, as I do now, entreat God's help—ask for God's help to enable me to keep them. I was too fond, in my young, proud days, of trusting entirely to myself—to my own will. Well, dear, I suffered one small matter or another to call me away, and an old gossiping woman and her daughter came and wasted my time; and when I heard the church clock strike, and knew my husband would be in in less than half an hour, and nothing ready to make him comfortable, though he had had a hard day's work at the saw-pit, in wet weather, I could have cried with

shame and vexation. My resolve had been so strong—in what?—in my own poor, weak strength! Well, I hurried; but it is hard racing after misspent time. My husband came in, dripping wet, about five minutes before his usual hour. He looked at me, and at the clothes-line that was stretched in front of the fire, and, with a small chopper that he had in his hand, he cut the line, and down went my half-dried clothes on the not over-clean sanded floor. 'A soft answer turneth away wrath,' saith the proverb; but I did not give the soft answer, and the wrath was not turned away.

"'Very well, Katie,' he said; 'there is no place here for me to sit and rest, and no supper ready; but I can get sitting, resting, and supper at the Blue Lobster, where many a fellow is driven by an ill-managing wife.' And with that he turned out of the door. It was in my heart to follow him, to lock my arms round his neck, and, begging his pardon, bring him back. But I was vexed about the clothes, and forgot the provocation. That was his first night all out at the Blue Lobster, *but it was not his last*. I saw my error, and I prayed then for strength to do my duty; but somehow my husband had got a taste for the popularity that grows out of a good story and a fine voice, and he had felt that woful night what it was to be warmed, when he was cold, by the fire of brandy, instead of sea-coal. Days passed; our little boy, our Willy, grew worse and worse. Time had been when Mr. Grey would walk the night with him on his bosom, to soothe him to sleep; but now, if the poor child wailed ever so heavily, he could not hear it. Another child had been given to us, but she only added to our difficulties. Then, indeed, I labored continuously to recall what I had lost, but drink had got the mastery. We were backward with our rent; my poor husband lost his customers, for he neglected his business; and both clothing and furniture went to satisfy our creditors, and that craving which cries for more the more it gets. I could not bear the sympathy of my neighbors—for they would give me their pity—held me up as a suffering angel—while every hour of my life I recalled the time when neglect of my wifely duties first drove my husband to the public-house.

"When sober, my poor dear was full of sorrow, but he had not the strength to avoid temptation. He never used any violence toward me, though if I attempted to hold any thing back he wished to turn into drink, he would become furious, and tear and rend whatever he could lay his hands on. One terrible night he broke every remnant of glass and china that remained of what once, for a tradesman's wife, I had such a store. Every thing was shattered, every thing trampled on and broken—every thing but *that one cup*."

"And how did that escape?" questioned Lucy.

"It contained the infant's supper," replied Mrs. Grey. "I saw his hand hover over it, and the same moment his poor blood-shot eyes rested on the baby, whose little outstretched arms craved for its food. Some silent message at that moment must have entered his heart; his arms fell down, and without an effort to support himself, he sank into a heap upon the floor in the midst of the destruction he had caused. I tried to get him on to where once a bed had been; we had still a mattress and a couple of blankets."

Lucy did not speak, but her eyes were overflowing, and she stole her hand into that of Mrs. Grey. The good woman soon resumed her story:

"I saw that even there sleep came to subdue and calm him. My poor child ate her supper and fell asleep, and my sick boy was certainly better, and also slept. I crept about, gathering up the broken pieces, and endeavoring to light the fire. A kind lady to whom I had taken home some needle-work that morning—for several weeks I had been the only bread-winner—in addition to the eight-pence I had earned, gave me a small quantity of tea and sugar; and an old pewter teapot that, however battered, would not break, seemed to me a comforter. He would awake, I knew, cold and shivering, but I hoped not until the Blue Lobster and every house of the same description were closed, and then his thirst would compel him to take some tea. I heard the church-clock strike one, and it was a joyful sound; no open doors, even to old customers, then. I knelt down between the children's blankets and my poor shattered husband, and prayed as I never prayed before."

"I had managed sufficient fuel to boil the kettle and create some degree of warmth, and I waited patiently and prayerfully for the waking. It came at last. The anger and the violence that had been almost insanity were all gone; only the poor broken-down man was there. He asked what o'clock it was. I told him the church-clock had gone half past one. He then asked for water. I brought him a cupful, another, and another, and then a cup of tea. After he had taken it, he gathered himself up and took the stool I moved toward him. I poured him out a fresh cup of tea. He looked for some little time vacantly at the table, and not seeing another cup, he pushed that one toward me. I drank, half filled it again, and moved it to his hand."

"My poor Katie," he said, and kept repeating my name, 'has it come to this—only one cup between us all?'

"And enough, too," I answered, smiling as gayly as I could—"enough to build a house and home on, if we trusted to tea."

"What is your meaning?" he inquired.

"I was almost afraid to say what I meant, but I took courage, while trembling. 'I mean, darling,' I answered, 'that if we could both be content with refreshment of tea, we'd soon have a better and blither house than ever we had.'"

"I've been a bad father and a bad husband," he said—for by this time he had nearly come to himself—"but all is gone, and it's too late to mend."

"I made no answer, but just drew down the blanket from the faces of the sleeping children—there never was any thing touched my husband like the little child."

"Is *all* gone?" I asked; and with that he crushed his face down on his clasped hands as they lay on the table, and burst into tears. I knelt down beside him, and thanked God for the tears in my heart, but I was so choked I could not speak; and we staid that way ever so long, neither saying a word. Now it is strange what turns the mind will take. Even while his face was wet with tears, my darling lifted it."

"Katie," he said—and it may seem to you nothing but a fond old woman's fancy, but I've always thought there was no music in the world ever so sweet as the way my husband says 'Katie' unto this day—"Katie," he says, 'let's turn the cup, and see what it reads.' Like all youngsters, I believe, we had tossed many a cup, in our boy and girl days, just for laughter. He took it up quite serious like, and turned it, and as he looked into it he smiled. 'There's a clear road,' he went on, 'and a house at the top, and a wonderful lot of planks; they can't be ours, for there is not a plank in or near the pit now.'"

"But there will be," I answered, eagerly. "It was only yesterday, down where the spinny overhangs the pool, I met Mrs. Groveley. She gave me a blithe good-morning, and asked if my goodman was going to turn his leaf soon. 'Tell him to make haste from me,' she said, laughing like a sunbeam; 'for he's too good a fellow to go on much longer as he's been going. There's goodness in him.'"

"Are you sure she said that?" whispered my husband.

"So I told him indeed she did, and more. 'She said she was waiting until you'd resolve to turn to like a man, and cut down the small lot of timber that's waiting for your hatchet on the corner farm. 'I'm determined,' she continued, 'no one but he shall fell those trees. As I shall want to use the planks in the spring, he has no time to lose.' She said something not pleasant about the public-house, but I could not let that pass; so I up and told her that it was my carelessness and neglect that turned you from your own fireside.'"

"You should not have said that, Katie,"

he answered. 'I've been a bad husband and a bad father, and I did not think there was one in the place now that would trust me with a day's work;' and his voice shook and faltered, but he got it out at last. 'Even if I did take a turn, it's not likely you could forgive me!'

"And then I fell weeping at his feet, and laid bare my heart, and repeated that if I had been what I ought to have been, and kept the house he put over me fresh and clean, as I ought to have kept it, instead of spending the morning of my days in vanity and idleness, we need not have been two shivering sinners at that hour. I repeated again and again that it was my ways that drove him to find by the tap-room fire what he had lost at home; and then I lifted up my voice, and called to my Saviour to look down and help us both. I, with my voice full of tears, promised my husband if he would try me—only try me—he would see what a home I would make for him. He was always one for a little joke, and even then he said, and twirled the cup, 'A well-plenished house in a tea-cup; one tea-cup between us.'

"'Yes,' I said, 'if nothing stronger than tea flows into that cup, or wets our lips out of that cup, *we will build our house.*'

"We both kept long silence, and the break of that blessed day, though it showed me my husband's once glowing and manly face pale and haggard, and his hand trembling—so trembling that he could not carry the tea-cup to his lips without spilling its contents—brought new life into our shattered home.

"Lucy, on that blessed day—this day eighteen years ago—strength was given us both to keep our promise to God and to each other; and somehow this text got stamped upon our hearts:

"'We can do all things through Christ, who strengthens us.'

"My poor darling! he had hard lines at first. Never was there a drunkard who did not cast about to make others as bad as himself. As the day drew on he had not courage to face the street; but I went up to Groveley Manor, and told the good lady that my husband would fell the trees; that he might be trusted, because he no longer trusted in his own strength; that he was a pledged teetotaler, and I was pledged to make his home happy; but that we did not trust in our own pledges, but in faith that we could do all things through Christ, who strengthened us.

"Still the lines *were* hard. He had to bear up against the taunts and the sneers of his boon companions, and I had to struggle hard to give a desolate room the welcome home look that would prevent his wishing for the lights and the warmth and the excitement, and the praise his songs were sure to obtain. But, however scanty

the furniture, a poor man's home can always be sweet and clean; *that* is in the power of the poorest; and though when he returned from his first day's timbering there was but one tea-cup between us, the old darned cloth was clean, the tea-pot and fire bright. No lord's children could be cleaner, and he said it was as good as a nosegay to kiss their sweet cheeks. It was hideous to see how his old companions loomed in upon our poverty, and tempted, or tried to tempt, him back. One terrible drunkard staggered in, and mockingly asked if I would give my husband leave to go for an hour—just half an hour even—and I rose and went into the little bedroom. I knew I could trust him, because he had ceased to trust himself. And I blessed God when I saw the tempter staggering forth, deriding my husband, and prepared to commit violence on any who opposed his progress.

"It is some time before neighbors or once friends can believe in a drunkard's reformation. The dear good lady who took the surest way to insure his lived to see our growing prosperity—'building a house with a tea-cup,' she always called it—and my goodman was not slow to declare the effect the clear high-road pictured forth in the tea-grounds had upon his excited imagination on that memorable night. Our necessities returned to us slowly—very slowly at first—but the neighbors, when they saw how hardily and earnestly my husband worked, offered us credit for what they thought we needed; but we resolved to abstain from all luxuries until we could pay for what we got. Some of our little valuables had been left at the public-house as security for scores, and the landlord thought himself a most injured man when my husband redeemed his one article of finery—a gold shirt-pin that had belonged to his father. We learned the happiness every Saturday night of adding to our comforts; and from that day to this my husband has always found his house swept and garnished—no damp linen hanging about, no buttonless shirts or holey stockings. The children were trained to neatness and good order, and the sound of discord and contradiction has never been heard within our home. The habits of our first months of marriage returned; a few verses of Holy Writ, a prayer, and a hymn refreshed the memory of our bond with God and with each other. We feel those exercises far more impressive now than we did when we practiced them as a cold ceremony rather than as the result of a living faith.

"In less than six years my husband built this cottage, I may say with his own hands. We got the bit of land at a low rate, and over hours he worked at it as only a teetotaler can work. Our Willy has never been a strong lad, and the doctor says if he had been even a trifle wild he would have been

long ago in the church-yard. With all my love for his beautiful infancy, I did not do my duty the first two years of his life. A careless wife is never a careful mother, whatever she may think; but it pleased the Lord to let in his light upon us before the night came. And it was not folly to carry two things first into this house—our Bible and the old tea-cup that attracted your curiosity. It is not too much to say that the cup often reminded us of our duties. And you can understand now, I think, darling, why Goodman and Granny Gray value it before all the gay china that could come from beyond the seas; for I may rightly say that, by God's help and blessing, *this house was built out of that tea-cup.*"

THE DAYS OF QUEEN ANNE.

MOOR PARK, the country home of Sir William Temple, stood not far from London, in a pleasant landscape, surrounded by its trim lawns and productive gardens.¹ The house was plain; its owner was not wealthy; but he was famous for honesty in politics, for his success in cultivating fruits and vegetables, and for some knowledge of the classics. He wrote essays that are scarcely remembered, and produced grapes and peaches that were probably much better appreciated by his friend Charles II. or William III. Moor Park itself, and perhaps its owner, would long since have been forgotten had it not contained within its quiet shelter a dark and turbid genius, slowly struggling upward to renown, and a pale and thoughtful girl, studious at once and beautiful, whose name and fate were never to be separated from that of her modern Abelard.

There had come to Moor Park a poor scholar, the son of a widow, in search of some means of subsistence; and Sir William Temple, upon whom the mother had some claim, either as a distant connection or an early acquaintance, touched by her extreme distress, consented to receive the young man into his house, and give him employment either as a reader or amanuensis. It was the first upward step in the life of the haughty Swift, who seems never to have been able to remember without a burst of rage that in his infancy he had nearly starved from the poverty of his mother, and that in his youth he had been a servant or a dependent in the Temple family. He never revisited Moor Park in his prosperity; he never spoke to any of the Temples;² he seems to have wanted wholly the sentiment of association, and was never softened into tenderness by the memory of the trim gardens where he had first walked with Stella, or of the real kind-

ness with which Sir William had raised him from poverty and neglect. In his inordinate sense of his own merits he seems to have felt himself injured by the benevolence of his benefactor.

Fate had provided for the impoverished scholar a companion and a pupil whose condition very closely resembled his own. On his return to Moor Park in 1696, after a serious dispute with his patron, Swift found in the house a Mrs. Johnson and her young daughter, who, like himself, were dependent on the generosity of the Temples. Esther, or Hetty, Johnson, the famous Stella, was now growing up into that rare beauty which was to become celebrated in letters, and a purity and gentleness of spirit that won the admiration of her eminent contemporaries. Her eyes and hair were dark, her complexion pale, her figure graceful, her expression pensive and engaging.¹ She was fond of knowledge, and glad to be instructed; and if her taste in literature was sometimes at fault, or her spelling never perfect, she was at least able to feel the beauties of a *Spectator* or an *Examiner*. Swift became her tutor, Mentor, lover. He taught her his own bold handwriting, explained the allusions of the poets, gave her a taste for wit and humor, and seems to have communicated to her alone the secret of his anonymous works. A perfect unity of feeling and of interests grew up between them, and four years of tranquil happiness glided away in the calm shelter of Moor Park, during which Stella ripened into graceful womanhood, and seems to have been treated by Sir William almost with the tenderness of a parent.² She mingled with the best society of the neighborhood, became acquainted with fashionable ladies and eminent men, and in London was already known as one of the most accomplished and beautiful women of the day.

More than the common sorrows of life, meantime, had fallen upon the family at Moor Park. Lady Temple, that Dorothy Osborne whom Sir William had courted for seven years with stately assiduity, had long been dead; their children passed away, one by one: the eldest son died by his own act, the victim of an extreme sensibility. The society of Swift and Stella probably served to amuse the last years of the eminent statesman; and when he died, in 1689, Sir William left to Swift the valuable legacy of his writings, and to Esther Johnson a thousand pounds. But their home was now broken up; for a time they were separated; they were only to meet in that irrevocable union which was to throw its mysterious shadow over the lives of both forever.

¹ Stanhope, *Reign of Queen Anne*. Wilde, *The Closing Years of Dean Swift's Life*.

² "I have done with that family," he says, in the *Journal to Stella*.

¹ A portrait of Stella still exists, pensive and beautiful.

² *Gentleman's Magazine*, 1755; and Wilde, p. 108. She was reported to be Sir William's daughter; but in his will he calls her his sister's servant.

Of Swift's startling eccentricities and wild bursts of rage, his cold, despotic temper, his unbending self-esteem, the frequent rudeness of his manners, his violence and pride, his contemporaries have recorded many examples. He was suspended or expelled from Trinity College for insolent and lawless conduct; he quarreled with Sir William Temple. "God confound you both for a couple of scoundrels!" he exclaimed to Earl Berkeley and his friend when they had offended him. His cruel duplicity to the two devoted women who clung to him with confiding fondness can never be excused. Yet were the gentler and better elements of his character so eminent and remarkable that the generous Addison could only think of him as endowed with every endearing virtue, the most delightful of companions, the most faithful of friends; and to Pope, Arbuthnot, Gay, and a throng of accomplished associates he was ever an object of sincere affection and esteem.¹ He was generous often to excess; he loved with an unchanging regard; he was happy in doing good; his countrymen in Ireland, who had felt his benefactions, followed him with an almost superstitious veneration, and were willing to die in his defense.

After their brief separation Swift and Stella were once more reunited, and the pleasant parsonage of Laracor, near Dublin, has become renowned as the scene of their happiest hours. Here Swift was made vicar, and upon a moderate salary lived in retirement and ambitious discontent. At his request or his command, Stella, who was now without a home, whose mother seems scarcely to have deserved her regard, resolved upon the dangerous plan of removing to Ireland to live near her early instructor. A female friend, Mrs. Dingley, accompanied her. It is impossible to say what promises of a future marriage were the inducements held out by her imperious master, whether he postponed their union until his income had increased, or left his future plans hidden in mystery. It is only certain that at eighteen years of age the beautiful Esther Johnson, already one of the ornaments of London society, and the reputed daughter of Sir William Temple, abandoned the gay world to hide in the obscurity of Ireland; to live in a cloud of doubt, assailed by calumny, and scarcely convinced of her own prudence; to reject all other suitors, and to await with patient cheerfulness the moment when it should please the imperious Swift to name the hour of their nuptials.²

The two ladies, Mrs. Dingley and Stella, occupied the parsonage at Laracor when Swift was absent; when he returned they went to private lodgings: no concealment

was pretended. It was well known that the two gentlewomen had followed Swift to Ireland; it was even believed that he was married to one of them. The days at Laracor passed pleasantly onward. Stella, secure of the attachment and attentions of him whom she looked upon as her husband, lived in cheerful confidence, and Swift seems to have given her no cause of alarm. She was ever to him "the fairest spirit that dwelt upon the earth." Her conversation was his chief delight. To her he opened his secret plans, and confided his most daring hopes. They laid out the canal at Laracor together, planted it with graceful willows, filled the garden with rare fruits, or adorned with simple comforts and embellishments the parsonage, whose ruins still show traces of its famous occupants.¹ Society gathered around them, and the eccentric union of the two protégés of Sir William Temple, who had long been known to the world of letters and of fashion, seems to have been looked upon as in no degree improper. Stella was courted by the grave and the gay; received offers of marriage, which she declined; wondered, perhaps, at the ungenerous delay of her suitor, but had not yet learned to reproach.

In 1704 dropped mysteriously from the London press one of those books that the literary world can never let die, yet one which it has tacitly agreed to hide in a decent obscurity. It treated of the most sacred themes with coarse ribaldry and painful familiarity. It was more shocking to a delicate taste than the barbaric wit of Rabelais and the keen levity of Lucian. Yet its rare originality, its biting satire, the profusion of its learning, the endless variety of its wit, and that clear and simple style, the result of long years of labor, in which the writer's mind, with all its fertile novelty, seemed to blend with that of his reader, made the "Tale of a Tub" the most remarkable book of the day. Its clouded renown opened the dawn of the golden age of Queen Anne. It was read by pious bishops with horror and delight, by eminent statesmen and ambitious lords, by the gentle Addison, by Somers, Garth, and the youthful Pope. Its anonymous origin was soon examined. Swift, who had already written popular pieces, was believed to be its author;² and the renown of being the greatest wit and the most original genius of his day was awarded at once to the Irish vicar. Swift now made yearly visits to London, and in the society of Somers, Montague, and Addison began to project schemes of ambition that were to end in signal defeat.

From their quiet retreat amidst the willows

¹ Scott, p. 69.

¹ Macaulay, "Sir W. Temple," with his usual severity, sees only Swift's harsher traits.

² Scott, *Life of Swift*, p. 68.

² Scott, p. 84. Swift borrowed his design from Rabelais, and must be content with the second place in the ranks of modern humorists, or perhaps the third—next to Cervantes.

of Laracor, Swift and Stella saw pass slowly before them the barbaric glories of the reign of Queen Anne. Chivalry, unhappily, still ruled in France. Louis XIV.—coward, impostor, the basest of voluptuaries, the chief savage of his time—proclaimed a tournament of the nations, and drove his starving and enfeebled people to fling themselves in miserable throngs against the patient Hollander, the quiet German, the soft Italian, and die in myriads on the fields of battle. When Swift retired to Laracor, Louis the Great was at the height of his renown. Europe trembled before the despot of Versailles, the modern Dionysius. While the people starved, the soldiers of France, clad in rich trappings and fed on costly food, were held ready to be let loose upon the factories of Flanders and the rich cities of Germany; and in every happy home or peaceful village from Strasburg to Vienna the ambition of the French Attila struck an icy dread.

To become "king of men," as his unchristian preachers were accustomed to salute him, Louis had sunk into a barbarian. Yet his youth had not been without its promise. He was the grandson of Henry IV., and had inherited at least the memory of the austere Jeanne d'Albret, and of the simple manners of Bearn. His own mother had neglected him. He could remember the time when his velvetsuit had grown threadbare from poverty, and when his scanty and ill-paid allowance scarcely gave him a tolerable support. He had been educated in sobriety, at a time when all France was flourishing with signal vigor under the influence of Huguenot ideas, when the fields were clad in wealth of food and population, the factories busy, and the prosperous nation had just entered upon a career of reform and culture that might have saved it all its later woes. Louis, the neglected boy, grew up fair, graceful, and gracious in his manners; but at twenty-two—still happier auspice for his country—became king in reality, under the guidance of the hardy intellect of Colbert. The Huguenot minister governed for a time the destinies of France, and Louis was the champion of economy, moderation, and peace.¹ Brief, however, was the period of his moral vigor: he fell with a memorable lapse. The pagan influence of the Catholic faith clouded his aspiring spirit. Corrupt confessors and plotting Jesuits condoned his enormous vices. He sank into moral and mental degradation, and Bossuet and Massillon celebrated in sounding periods the mighty monarch who had driven the Huguenots from his kingdom with unexampled atrocities, and whose barbarous ambition had filled Europe with slaughter.

The crimes of Louis can scarcely be sur-

passed. Without provocation he broke into Spanish Flanders, and spread desolation over that rich territory, whose boundless productiveness has outlived the wars of centuries. Without provocation he poured the finest soldiers of Europe into the busy fields of Holland. City after city fell bleeding and defenseless before his arms. Already the Jesuits and the Catholics believed themselves masters of that wonderful land, where the printing-press and the free school had nerved the intellect of the Calvinist in its desperate struggle for independence, and whose vigorous thought had sapped the strongest bulwarks of Rome. But the Dutch had torn down their dikes. The ocean rolled over the scenes of prosperous industry, and Louis retreated from the land he had covered with despair.

Yet it was against divided and distracted Germany that the great king perpetrated his most unpardonable crimes. That hive of nations, from whence had poured forth in successive streams Goth and Vandal, Frank and Saxon, to renew the energies of the Latin race, was now to lie for hopeless years at the feet of haughty France. Louis seems, in his insane ambition, to have believed the Germans an inferior race, into whose savage realm the gay and civilized legions of Paris might penetrate without an effort, and ravage without remorse. To extend the frontier of France to the Rhine, over blazing Alsace and the blood-tinged Moselle, Louis labored for fifty years.¹ No such scenes of human misery and national shame had been witnessed in Europe as were those over which the gracious and courtly king exulted with horrible joy. Twice he had sent orders to desolate the Palatinate, and reduce to a naked waste the fairest province of Germany. For seventy miles along the banks of the Saar, villages and fields were swept by a general conflagration, and the miserable people fled to their forests, to perish by famine or disease. Strasburg he had seized by an open fraud. In September, 1681, when its chief citizens had gone to the Frankfort fair, in the midst of a recent peace, the French troops surrounded the great city, the key of Germany, and demanded its surrender. Its garrison trembled before the heavy artillery and the unexpected attack of the foe. The gates were opened by treachery, and Strasburg fell into the power of the French. The Protestants were driven from its renowned cathedral, where they had worshiped for more than a hundred years; and Louis, without a blush, made a triumphal entry into the city he had violated his honor to obtain, and from whence he hoped to inflict new miseries upon the German race.

Nor did it seem possible that Germany

¹ Martin, *Hist. France*. In 1662 Louis and Colbert were laboring to check pauperism and elevate the people. Vol. xiv. 615 *et seq.*

¹ *Mémoires de Louis XIV.* (written by himself), *Archives Curieuses*, viii. 335, show his constant activity, his ceaseless ambition: p. 319.

could long survive the ceaseless malignity of its French foe. In 1683 Louis had called to his aid the savage Turks—the scourge of European civilization. With an army of two hundred thousand men—the largest that had been seen in Europe since the fall of Constantinople, the grand vizier, Mustapha, a brave and skillful soldier, broke into Germany and laid siege to Vienna. The emperor and his family fled from his trembling capital; its garrison was small, its fortifications imperfect; and in June, when the immense Turkish host sat down before the city, there seemed little hope that the empire could be saved. All Germany awaited with almost supine awe the fall of the house of Hapsburg.

The siege was prosecuted with terrible vigor; the Viennese resisted with undoubted heroism. Every day new mines were sprung; the walls were shattered by huge parks of cannon. The weary defenders repaired at night the ruins of the day; yet the Turks pressed on, eager for the plunder of the wealthy city, and filled the trenches with the Christian dead. At length, in the beginning of September, a mine was sprung under the bastion of Burg; half the city shook and tottered at the dreadful shock, and a wide breach was opened, sufficiently large for a whole battalion to pass in. The garrison had melted away with toil and battle, and the hopeless Viennese prepared for the final assault that might deliver their proud city forever into the hands of the infidel.¹ But on the morning of the fatal day John Sobieski, King of Poland, stood on the Kalen Hill, at the head of forty thousand men, surrounded by the princes of Germany. The Turks were arrested in the moment of triumph; and on the 12th of September, leading his brilliant cavalry, Sobieski sprang from the hills into the centre of the throngs of Turkish horsemen, and chased them in a wild flight along the plain.²

At night a panic seized the whole Turkish force, and they fled silently from their countless tents. Sobieski, in the morning, saw before him the rejoicing city, just delivered from a horrible doom, and a boundless wealth of spoil in gold, silver, and rich robes, the great standard of Turkey, and the baths, fountains, and gardens of the luxurious Mustapha. Germany and Europe rang with the praises of the gallant Pole; and Louis alone lamented the discomfiture of the Turks.

In 1688 he began a new war against the enfeebled Germans. It opened with an act of singular atrocity. In the depth of winter, when the fields and forests lay clad in snow, the French cavalry swept into the fertile provinces of the Rhine. Around them

were rich and famous cities, renowned as the centres of early Protestantism and freedom, and countless villages—the emblems of centuries of toil. All were to be destroyed. The inhabitants in that cold and mournful season, the period of domestic festivity, were ordered to abandon their fine cities and pleasant homes, or were driven at the point of the bayonet, naked and defenseless, into the snow. When they asked why they were treated with such severity, they were told, "It is the king's pleasure." They wandered out, beggars and homeless. Behind them, over the wintry landscape, they saw the flames sweep over Worms and Spire, Heidelberg or Baden. Every city was burned to the ground; the French soldiers plundered the tombs of the Salic emperors, and robbed the churches of Spire. The hapless people died by thousands, of starvation, frost, despair, and grief; and the civilized world admitted that the enormities of Louis had never been surpassed by Turk or Hun.¹

Yet the great king, dead and sick at heart, scorned the reproaches of civilization, and lived only for glory. Never was his manner more gracious, his court more splendid, his Bossuet or Massillon more enthusiastic in his praise, his gross degradation more apparent, his hollow pomp more shocking and disheartening, than when, in 1689, he could point to the blighted waste of the Palatinate, and to his prisons and galleys thronged with Huguenots. All Western Europe rose against him. Holland, England, Germany, Italy, Spain, led by William of Orange, united to crush the common foe of civilization. He repelled their efforts with fearful sacrifices to France. He was still "king of men." At the peace of Ryswick he scornfully enforced the Catholic faith upon countless German towns, and still saw Europe tremble at his nod.

Then, when for sixty years Louis had sat upon the throne of France (1702), William III. died, and Anne, the mild, dull queen, ruled over divided England.² Scarcely did the daughter of James II. appear likely to become the avenger of Germany—to perfect the plans of William and decide the fall of Louis. She was slow and cautious; neither good-natured nor malicious. Of intellect she showed scarcely a trace; she could not have known the difference between Pope and Blackmore, or Addison and Dennis. She was never sensible of the merits of Swift. Yet around the unlettered queen were gathered the brilliant fruits of the second English revolution; and her authors, statesmen, and commanders, her men of science and of action, set bounds to the ambition of Louis.

All France was now mad with vanity and misery. The gentle touch of Addison has

¹ Kohlrausch gives the German view of these horrible scenes. *Hist. Ger.*, ch. xxviii.

² By her contemporaries she was known as "the incomparable princess." *Life of Queen Anne*, 1714.

² Hormayr, p. 295.

painted in his letters the boastful Frenchman starving in his glory, and looking down with scorn upon those inferior races who seemed to follow as captives the triumphal chariot of his king. In his old age Louis had placed his grandson Philip on the throne of Spain. Europe accepted the challenge; the war of the succession began; a French army once more broke into Germany; Bavaria joined the invaders; and the divided empire seemed at last destined to perish before the ceaseless malice of the Gallic king.

Germany might well have sighed for a Barbarossa, and waited for the rising of that mighty barbarian whose haughty spirit was believed to hover still around its beloved Rhine; but the Emperor Leopold¹ had none of the talents of his predecessor, and his long reign had been marked only by the misfortunes of his realm. His small, distorted figure, his projecting under-jaw, his cold and Spanish gravity, his feeble mind, made him no worthy champion against the graceful and talented monarch who had sold himself to glory; and Louis might well scoff at the dull ruler of a disunited people. But far up in the north of Germany the French had found a more resolute foe. Frederick William of Prussia had brought his small principality into unprecedented renown. He had been the first to defy the power of France. His intelligent troops had become famous on many a battle-field. His vigor sustained the courage of the Germans, and the Prussian soldiers and a Prussian general were the central figures of the German troops. His successor assumed the royal title, and Prussia, in the moment of danger, stood firmly by the side of the feeble Leopold.

From his stronghold at Strasburg, penetrating the natural defenses of Germany, Louis supposed that his accomplished commanders would march almost without resistance to Vienna; his soldiers had never yet been beaten; he had held Alsace and the Rhine against the vigor of William of Orange, the power of England, and the efforts of a grand alliance; nor could he have thought to have encountered any braver foes than those to whom he had haughtily awarded the treaty of Ryswick. The dull Anne and the feeble Leopold he had treated with singular indignities. He had named a king for England, and had proclaimed the Pretender James III., amidst the acclamations of his courtiers and the joy of the Catholics of the British Isles. His gold had been freely distributed among English statesmen, and his emissaries were always busy in the secret intrigues of the English court. Marlborough and Sunderland had been his pensioners. It was believed that Anne herself was not unwilling to acknowledge her unfortunate

brother. His grandson Philip had been received with ready loyalty in Catholic Spain. The Archduke Charles must conquer his kingdom before he could hope to reign. The war of the succession opened for the great king with a boundless prospect of universal dominion; and the nobles and the marshals of France crossed the Rhine, inspired by the memories of half a century of uninterrupted success, in the proud confidence of superiority.¹

But England was now thoroughly Protestant; its Catholic faction had sunk into a feeble minority; the intellect of the nation, which had been debased and degraded under the insincere rule of Charles or James, had begun to produce examples of public virtue worthy of the days of Cromwell and of Milton; and the people of England, shocked at the chivalric crimes of Louis and the corrupting vices of a Romish court, had resolved, with rare unanimity, to break down the haughty despotism of France forever. The money of the English merchants was lavished in maintaining the unity of Germany. The wealth of Dissenting tradesmen sustained the house of Hapsburg on its ancient throne. The gay nobles of the Parisian court, whose pedigrees had been carefully marked out for eight generations, were found to have lost the savage virtues of their ancestors; the factories of England and Holland repelled the fierce inroads of the feudal lords.

Anne was represented on the battle-field by Marlborough; Leopold by Eugene. A friendship grew up between the two great generals as constant as it was sincere; and whatever may have been the earlier faults of Marlborough, he seems to have given all the best resources of his genius to the aid of European freedom. If he had been in the past a traitor, a perjured commander, the pensioner of Louis, he grew, under the influence of a real friendship, into sincerity and honor.² Modest, small, dark-complexioned, insignificant, the fiery ardor and vigorous principle of the Savoyard soldier had fixed the admiration of the eminent Englishman;³ with Eugene, Marlborough ceased to be treacherous; together they struck down the power of Louis, and put back for nearly a century the Gallic conquest of Europe. Yet in tactics they represented the two opposite forms of military genius. Marlborough, calm, impassive, never at fault, moved his squadrons with precision, and waited for the moment of victory; Eugene, sword in hand,

¹ Kohlrausch, ch. xxviii.

pressed to the front, and led the fury of the battle. Marlborough guided the whirlwind; his companion was ever in the van. The small and insignificant figure of Eugene seemed filled with grandeur as he sprang upon the French at Blenheim, or sank wounded before the walls of Turin. The impassive Englishman showed scarcely a trace of unusual excitement in the moment of danger or success. Before their varied qualities the mighty fabric of French ambition fell with a sudden shock.

The time may come when the barbarous details of warfare will cease to be interesting, and when men will turn with disgust from the nameless horrors of the battle-field and the campaign. Yet the military glories of the reign of Queen Anne have, at least, the excuse that they were necessary. Tallard, at the head of eighty thousand French and Bavarians, was pressing on to Vienna. He was met at Blenheim by Marlborough and Eugene, with an inferior force. The French, stretching far along a range of difficult heights, surveyed their foe. The two friends resolved to storm the hills. In front of the French lines spread bogs, rivulets, and morasses; but difficulties vanished before their resolution. Eugene was opposed to the Bavarians, and among his troops was a select band of Prussians, then first rising to renown. Marlborough led the Hollanders and English against the best soldiers of France. The roar of battle resounded through the still August day, and often as their troops shrank back from the rain of cannon-balls that swept over the marshes of Höchstadt, the two friends rallied them once more to the charge. Struggling in deep bogs and difficult paths, Eugene pressed upon the Bavarians, and was nearly cut down by a Bavarian trooper. But a charge of the Prussians decided the battle on the right wing; on the left the famous squadrons of Louis yielded to the steady courage of Marlborough, and the night fell on the utter ruin of the army of Tallard. How many perished on that dreadful day, what troops of prisoners were gathered up by the weary victors, what stores of money and of arms came into their hands, it is scarcely necessary to remember;¹ it is sufficient to know that the pride of France was broken, and that German peasants and villagers, set free from their life-long terror, sang the praises of Marlborough and Eugene as they tilled the fertile pastures of the Danube and the Elbe.

The two commanders now separated. Eugene, with a force of twenty-four thousand Germans, among whom were the famous Prussian band and their commander, the Prince of Dessau, climbed over the mount-

ains and crossed the rivers that separate Italy from Germany, performing one of the most romantic feats in warfare, and fell suddenly upon a great force of eighty thousand French, who were besieging the capital of Savoy. The city had nearly fallen when the Germans, moving swiftly along the banks of the Po, threw themselves upon the hostile lines. The prince was at the front; the Prussians struck a well-aimed blow; eighty thousand French, dismayed and broken, fled before an inferior force, and Italy saw, with amazement, the disastrous flight of the soldiers of the great king. Meantime, in the Low Countries, Marlborough, at Ramillies (1706, May 23), had rivaled the terrors of the battle of Turin. Louis sent his best army and Villeroi to defend the territory he had wrested in his prosperous youth from Spain. Not far from that memorable field where France and England struggled for victory at Waterloo, and Wellington and Napoleon had finished, a century later, a generation of warfare, Marlborough received the attack of the brilliant and well-trained squadrons; on that day he emulated the daring of Eugene; he was every where in the heart of the battle;² his horse fell under him, and he had nearly been captured by the enemy; his aid was shot at his side: but when the dreadful labors of the day were ended, the throne of Anne, the liberties of Holland and of Germany, were secured.

Blenheim, Turin, and Ramillies were followed by the union of the two chiefs; and again, at Oudenarde, 1708, they shattered, by incessant toil, the last army of France. Marlborough, eager to do honor to his friend, had placed him in command of the English troops; he kept himself the Germans. The landscape of the battle was a rich and level country, sown thick with towns and hamlets, with farms and valleys teeming with plenty, and pleasant woodlands, above whose tree-tops the turrets of peaceful abbeys and lonely castles rose over the tranquil scene. All was now torn with the raging contest.² The French were slowly beaten. The night fell, and at length the glittering fires of musketry amidst the darkness revealed the converging lines of the allies. The French fled to Ghent, and Marlborough and Eugene felt that their labors were nearly over. Terror and gloom filled the once boastful streets of Paris, and its aged king might well have looked to see the Germans at Versailles. Soon, too, the powers of nature lent their aid to complete the miseries of France. A winter the most severe ever known in Europe froze the Seine to its bed; the rigors of Lapland were repeated in Normandy and Guienne. The crops froze in the ground; the peasantry and their cattle perished by the road-side; vineyards were destroyed; the

¹ Life of Queen Anne, 1714, p. 95, 96. "The glorious battle of Blenheim." Marlborough's Dispatches, i. 39, give that commander's modest account of the battle.

¹ Coxe, i. 407.

² Id., ii. 247 *et seq.*

pastures were converted into icy wastes; and when the summer opened famine preyed upon the enfeebled nation, and Louis saw around him a dying people and a ruined realm.¹

In England, meantime, the tumult of victory had been followed by a weariness of slaughter and a longing for the calm of peace. The passions of men were stilled. Even the fearful splendors of Blenheim and Ramillies ceased to awaken exultation. Spain had been conquered and lost; Gibraltar alone remained; Leopold and Joseph had died, and Charles VI. ascended the imperial throne. The safety of Europe, it was asserted, demanded that Philip should be permitted to rule at Madrid, and that Louis, humbled and disarmed, should be spared the last humiliation of utter defeat.

Thrice had England risen on the wave of advancing thought to singular eminence. The Protestant reform of the reign of Elizabeth had given birth to a throng of stately intellects, original, vigorous, creative. A second movement of the popular mind toward honesty and austerity had produced a Milton and a Hampden. And now, by a third impulse, the narrow realm of the good Queen Anne was raised to the first rank among European powers. Scarcely, indeed, had the dull prejudices of feudalism passed away, and it was still the fashion with the eminent and the wise to trace their descent from Norman robbers or Saxon thanes, to indulge in the ostentation of rank, and lay claim to a fancied superiority. It was still held more honorable to have come from a knightly race, whose mail-clad hands had been stained with Moslem blood, who had shone in the guilty revelries of barbarous courts, and had abandoned learning to clerks and priests, than to possess the wit of Addison or the genius of Bacon. The people were still contemned; yet from the rising vigor of the people had sprung almost every one of the wits, the courtiers, and the statesmen who had made the dull Anne the arbitress of Europe.

Anne had herself inherited her sober virtues from the honest yeomanry of her mother's family; the corrupt instincts of the Stuarts were tempered by the regular habits of the Hydes.² Marlborough, the savior of Germany, had risen from comparative obscurity by every unworthy artifice, as well as by his successful sword; Halifax, the orator and wit, had come up to London with an ingenious fable and fifty pounds a year, and had been pampered into unhappy satiety, like the city mouse of his own tale; Somers rose from poverty and insignificance; St. John was married to the descendant of a

wealthy clothier; Harley covered his obscure origin by a fancied genealogy; and the ruling caste of England, in this gifted age, was formed in great part of men who were prepared to recognize personal merit, since they had found it the source of their own success.

The clouded fame of Marlborough has sensibly decayed; few now care to pursue the devious intrigues of Bolingbroke and Oxford; but from the successful reign of Queen Anne still gaze down upon us a cluster of thoughtful faces whose lineaments the world will never cease to trace with interest, and to whom mankind must ever turn with grateful regard. One fair, soft countenance alone is always serene. No lines of fierce struggles or of bitter discontent, of brooding madness or of envious rage, disturb that gentle aspect. A delicate taste, a tranquil disposition, a clear sense of the vanity of human passions and of all earthly aims, have softened and subdued the mental supremacy of Addison. To some he has seemed feeble; for many he wants the fire of genius. But multitudes in every age have been held willing captives by the lively play of his unwearied fancy, his melodious periods, his tenderness and truth; have yielded to a power that is never asserted, and to an art that is hidden in the simplicity of a master. By his side gleams out from the mists of centuries the severe and intellectual countenance of Alexander Pope. Bitter, treacherous, and cruel, magnanimous and full of moral vigor, the teacher of honesty and independence, the poet of Queen Anne's age still holds his high place in the temple of fame. His versification, so novel and so perfect to his contemporaries, has long sunk into monotony under countless imitators; his satiric vigor is no longer felt; the splendor of his artifice and the glitter of his rhetoric amaze rather than delight; yet while literature endures the wise sentences and the keen insight of the philosophic poet will instruct and guide his race.

Gentle Parnell and pensive Gay, the vigorous thought and powerful diction of the corrupt St. John, the honest aspirations of a dissipated Steele toward ideal virtue, the melody of Tickell, the inventive genius of Defoe, the rude criticism of Dennis, the wit of Arbuthnot, and some few lines of Prior, survive from the faded glories of the age; and memorable above his contemporaries by his griefs, his brooding madness, his fierce and unsparing pride, the dark and troubled aspect of Swift looks down over the waste of time. There was never any thing of trust or joy in his solemn eyes. There is neither faith nor hope in the "Tale of a Tub" or "Gulliver's Travels." He came into life already weary of existence, and left it in the gloom of madness.

Swift came up to London in 1710, upon some important business for the Irish Church. He soon began that brilliant but scarcely

¹ St. Simon paints the miseries of France; the court was served with black bread. St. Simon gave reluctantly part of his plate to the treasury.

² Anne was the daughter of Anne Hyde, whom James married when Duke of York.

honorable political career which engaged for several years his vigorous faculties, awoke his overbearing ambition, and left him in moody misanthropy and discontent.¹ Two famous women controlled successively the feeble intellect of Anne. Her strongest passion was an impulsive friendship, and the severe pen of Macaulay has traced with inimitable fullness the ardor of devotion with which she yielded to the imperious fascinations of Sarah Jennings, Duchess of Marlborough. But the reign of the bold and vindictive favorite was now drawing toward its close, and a political revolution that was to decide the whole policy of England was brought about by the secret influence of a woman of a very different character.² A cousin of the duchess, Abigail Hill, had been admitted as an attendant upon the queen. She proved crafty and subservient. She betrayed her cousin, and supplanted her in Anne's feeble affections. The duchess discovered her treachery. She covered Anne with reproaches, she wept, she implored; but the stubborn queen clung to her new favorite, and at length the haughty duchess was driven from the court; her husband, the great duke, fell with her; the Whigs were deprived of the power which they had held for so many years, and the Tories and the High-Churchmen, led by Harley and Bolingbroke, ruled over England.

The literary men had all been Whigs, and had been brought into notice and covered with favors by that progressive party, which was represented in the Church by Tenison and in the Parliament by Montague. They remained, with but few exceptions, true to their principles and their benefactors. Addison, dignified and gentle, led his obedient followers into the opposition; Steele, profligate yet honest, employed his ready pen in the defense of the fallen Whigs; Congreve, Tickell, Philips, and Budgell remained unseduced by the brilliant prospects of the triumphant faction. But the Tories succeeded in purchasing with bribes or winning by flatteries two of the chiefs of that gifted band who were to complete the renown of the reign of Queen Anne. No man had been more lavish in his flatteries of Marlborough, or a more vigorous suitor for the favors of the Whigs, than Matthew Prior.³ He now abandoned his friends and sold himself to St. John. His wit, his address, his dissolute morals, and his poetical fame made Prior the chief confidant of the new ministry, the companion of their pleasures, and their representative at the court of Louis. The poet negotiated the treaty of Utrecht, and saved France from a German invasion. But the

chief of the traitors was Jonathan Swift. It is possible that in the dawn of his career, touched by the high inspiration of letters, Swift had felt the charm of ideal virtue, and had lived above the inferior impulses of his age. He was always fond of boasting of his integrity, his independence, and his conscientious merit. But his feeble virtues now yielded to the shock of disappointed ambition. He abandoned his liberal principles, separated from his early friends, and went over to the Tories. He was received with singular favor. He became the constant associate of the unprincipled Harley and the profligate St. John, of Abigail Hill, who had become Lady Masham, and of the gay circle of dissipated courtiers who controlled the policy of Queen Anne.¹ Pious men were shocked to see an eminent clergyman the chosen companion of the worthless and the gay, and the keen wits of the fallen party pursued the renegade with ingenious malice. But Swift replied to their taunts with a ribald brilliancy that soon disconcerted his feebler foes, and amidst the elation of a political triumph, and the flatteries of ministers and lords, poured forth the most wonderful of party diatribes. He seemed to live in an atmosphere of exhilaration, to hold in his hands the avenue of promotion. He was fond of boasting to Stella how he loved Harley and St. John, and how they both treated him as a favored friend. He was eager with vague hopes, but often sinks into despondency; and the famous *Journal*, the picture of an unquiet soul, shows how Swift clutched at wealth and power, and lost his integrity.

Scott, a name ever memorable in letters for consistency, if not for acute discernment, has labored to excuse the fatal lapse of his great predecessor; but his palliation scarcely conceals the fault. It is not sufficient to assert that Swift's zeal for the Church drew him over to the Tories, for it must also have led him into a captious leaning toward the Pretender, who could hardly be thought a friend of the English establishment. In his bitter discontent Swift seems to have abandoned all principle, and yielded himself wholly to the promptings of passion and a ceaseless thirst for vengeance upon his early friends.

There had come a time in the annals of France when it seemed that the Germans and the Dutch, the English and the Prussian, might march almost unopposed to Paris; when the fountains of Versailles must play for a foreign master, and the gay parterres of Marly sink beneath the tread of hostile squadrons; when Louis must flee from his luxurious chambers, to hide, like

¹ The *Journal* to Stella commences with this visit, so long protracted, to London.

² Correspondence of Duchess of Marlborough, ii. 105. The angry duchess, after all, has little to say against her rival.

³ Coxe, i. 421.

¹ "The Rev. Mr. Swift and Mr. Prior quickly offered themselves for sale," says the Duchess of Marlborough. *Corresp.*, ii. 129.

James II., an exile in a distant land. Nothing could resist the splendid onset of Marlborough and Eugene. Lille, the capital of French Flanders, yielded to their united skill. The path lay open to the heart of France; and Louis trembled in the midst of those magnificent palaces which he had reared to his own glory amidst the ruin of his people. Huguenot riders swept from Courtray to Versailles, and captured an officer of the royal household on the bridge of Sèvres. The streets of Paris rang with the news that the enemy was near.¹ No longer the magnificent, the beloved, amidst starvation, death, and penury, the aged king saw insulting placards hung upon his statues, and heard the murmurs of dejected France.²

Scarcely eight years had passed since Louis, almost monarch of Europe, issuing from his gorgeous chamber at Versailles, had presented to the Spanish ambassador and a splendid throng of all the chief dignitaries of his court, his grandson, Philip of Anjou, as King of Spain, and amidst the applause of a corrupt assembly had openly violated his plighted faith; and now, on a mournful day, a council was gathered, covered with humiliation and dissolved in tears.³ There was the dull, unprincipled dauphin, his son, the heir of that great kingdom, which was now wasted with famine and threatened with a sudden conquest; there was the young Duke of Burgundy, the best of all the depraved grandchildren of Louis, the direct heir of a tottering throne; there were eminent statesmen and stately nobles—Torcy, Beauvilliers, or Pontchartrain; and there, as Beauvilliers painted in vivid eloquence the woes and dangers of the realm, princes and nobles wept together, and Louis, with bowed head and breaking heart, consented to send an agent to Holland to ask mercy and peace from the Dutch. If William of Orange could have looked upon that scene, and beheld the humiliation of the destroyer of his country, he would have remembered with renewed satisfaction the time when, before the triumphant legions of France, he had ordered the dikes to be cut, and amidst the roar of the North Sea billows had called all Holland to the defense of its freedom and its faith; when the Calvinistic people, roused by his heroism, had defied the rage of the Jesuits,⁴ and trusted in an arm mightier than all earthly powers. But the Dutch were now in no mood to listen complacently to the almost abject supplications of Louis. They had been bitterly wronged. France and Louis had labored to blot them from the earth. They offered only terms so severe and degrading

that, even in its despair, the court of Versailles preferred war to submission.

Happily for Louis, a wide revolution had taken place in the politics of England; and the Tory reaction, covering the intellect of the age with the dreamy dullness of mediæval High-Churchism and the doctrines of passive obedience, had inclined the nation to look with sympathy upon the fallen monarch and his faded glories. The Tories stretched out a friendly hand to save the centre of European despotism and of regal follies and crimes. They had little in common with the Dutch reformers and the rising intellect of Northern Germany. Anne herself was a Stuart, remembered the close alliance of Louis with her uncle and her father, and was no friend, perhaps a feeble enemy, to the plans of William of Orange and the rapid growth of Protestantism. Marlborough and Eugene were checked in their invasion of France; yet they were permitted to move slowly onward, and at the great battle of Malplaquet, the most fiercely contested of all this disastrous war, the new army of France was defeated with dreadful slaughter; and again the enemy were looked for in Paris. At Malplaquet, on French soil, the fate of Louis and his dynasty seemed decided. His army, led by the brilliant Villars, had shown the courage of desperation, the self-sacrifice of a spurious patriotism. Thrice had Eugene led his best troops against the French intrenchments, and was still beaten back. The Dutch contingent, under a Prince of Orange, threw itself by mistake against a line bristling with cannon and guarded by a triple defense, and, with pertinacious resolution, was nearly cut to pieces on the spot. The prince retreated behind his heaps of dead. The Huguenot brigades, the flower of a devoted race, lay strewn upon the fatal field; and Prince Eugene, wounded by a musket-ball, was carried fainting to the rear. But while the French thus bravely held their ground, their line was again shaken by the steady advance of Marlborough with the English and the Prussians. Once more Eugene, his wound bound up, sprang onward at the head of his daring cavalry, and, with a despairing cry, the centre of the French army broke, and the great host fled before its foe.

The conquest of France seemed now no difficult task,¹ and the Germans, the Prussians, and the Huguenots were ready to press forward to the siege of Paris. Happy would it have been for Europe and for Frenchmen had they been permitted to complete their victory. They might have restored toleration to the Church and self-respect to the people; they might have driven the Jesuits from France, the source of all its woes;

¹ St. Simon, Mem., 1709. The courtiers were afraid to go out of the city.

³ Torcy.

⁴ Even the popes and Louis feared the malice of this dangerous body. See St. Simon, *Les Jésuites*, vol. x.; *Œuvres*, p. 107.

¹ Marlborough was removed from his command, and the invasion of France abandoned. That France must have fallen, had the allies pressed on either in 1709 or 1710, seems scarcely doubtful.

they would have renewed the Huguenot colleges at Sedan or Saumur, and invited from every side the elements of reform; they might have scattered forever that gilded throng of poisoners, assassins, idiots, and imbeciles who had proclaimed themselves the rulers of France, and who, under the despotic guidance of Louis and the Jesuits, were sowing the seeds of endless woes. But the Tory reaction of England checked the career of reform in London as well as in Paris. The Huguenots and the Dutch were forbidden to conquer France. Louis and the Jesuits were left to rule over the decaying kingdom; and the bitter pen of Swift, ever malignant and destructive, covered with sharp ridicule that vigorous alliance, the dying legacy of William of Orange, which had alone preserved the liberties of Europe.

Five years of a weary life yet remained to good Queen Anne, and of ceaseless plotting to the Tories. They knew that their power must cease with her reign, and that when the Hanoverian king ascended the throne, the principles of Protestantism and the liberal policy of William would again govern England. It was believed by many that Bolingbroke, and perhaps Oxford, had engaged in a plan for bringing back the Stuarts; that popery was to be restored with the Pretender; that a period of anarchy was approaching, when the nation would once more be driven to contend against French corruption and a Catholic king. The Tories, careless of the clamor of their opponents, resolved to break up the grand alliance, to desert their allies, to save Louis. Prior went on a secret embassy to Paris; Swift wrote his "Conduct of the Allies;" the treaty of Utrecht (1713) was slowly perfected; and Louis rose from his humiliation, still the master of Alsace and Strasburg, and saw his grandson Philip firmly seated on the throne of Spain.

That the peace of Utrecht was unjust to Germany and Holland, to the exiled Huguenots, who had fought for the freedom of England on many a battle-field, to the Protestants of Strasburg, and the friends of toleration in every land, can scarcely be denied; that Bolingbroke, Swift,¹ and Oxford were bound to the despot of Versailles by no honorable ties, was openly asserted by many of their contemporaries. If they were not engaged to bring back the Pretender, they at least felt a lasting hostility for the Protestant king from Hanover.

It was in the last years of Queen Anne's reign that, every morning, was laid on the breakfast-tables of tasteful lords and quiet citizens a small printed sheet that told the mournful story of Sir Roger and his widow; discussed the sources of the beautiful and

the sublime; made "Paradise Lost" familiar to countless readers, and unfolded to the world the graceful meditations of a spotless mind on the problems of life and of immortality. While party strife raged with unexampled bitterness, Addison, the tranquil spectator, taught all the milder virtues and softened the rude manners of his age. With less success, but still more general applause, he produced a tragedy in the cause of freedom, of which only a brief monologue survives. At the same time was printing at the London press a magnificent volume,¹ rich with the rarest decorations of luxurious typography—a translation by one who could scarcely read the original, with slow labor, of the ever-living tales of Homer. Such unscrupulous audacity was rewarded with an unbounded triumph. Golden showers rained upon the poet; he rose at once to unprecedented fame; and if a wide eminence be a proper object of congratulation, Pope might be looked upon as the most successful of his contemporaries: more fortunate than Marlborough; happier than Swift. Nor was his triumph undeserved; for the rich fields of English poetry have no more captivating mine of poetic gems, of the touching, the graceful, and the sublime, clothed in sonorous couplets, and radiant with a glittering diction, than Pope has ravished from the boundless stores of Homer. What he has brought with him almost compensates us for all that he was incapable of bearing away. The simplicity and majesty of his original he never ventured to imitate. Swift, meantime, was startling the literary world with those unrivaled political satires that have never ceased to find imitators and readers, and had, perhaps, already conceived the design of "Gulliver's Travels;" Defoe had not yet turned from party strife to write "Robinson Crusoe;" a throng of inferior writers sought the public ear. In the midst of the new literary activity Johnson was born (1709), and Hume (1711)—the most successful students of Addison and Swift. Shakspeare and Milton, now rescued from neglect, rose into general favor, and literature began that vigorous contest, of which the victory has not yet been won, against medieval ignorance and feudal follies.

The dull queen cared nothing for the strains of her bards or the graceful periods of Addison and Swift; she was sick, unhappy, and alone. Her husband and all her children died before her; fierce dissensions had broken out among her ministers. Bolingbroke and Oxford, torn by an insane emulation, brought their quarrels into the council chamber, and disturbed the last days of the feeble queen with their coarse recrimination and bitter hate. No tenderness for their dy-

¹ "I hope they can tell no ill story of you," wrote Archbishop King to Swift, after his fall.

¹ Pope's Homer was printed 1715, after Anne's death, but belongs to her period.

ing mistress, no memory of her favors, restrained the rude natures of those corrupt men, to whose hands was committed the destiny of a cultivated nation. Harley came intoxicated into her presence; the character of Bolingbroke was well known to his mistress; yet the queen was forced to listen to their counsels and submit to their advice. At length that event which the Tories had long looked for with natural alarm was hastened by the imprudence of their chiefs, and Anne was seized with a mortal illness. One morning she rose, fixed her eyes for a long time on a clock that stood near, and when a lady in waiting asked her what she saw unusual, turned upon her with a vacant gaze and fainted. On the 31st of July, 1714, Anne died, and with her passed away forever the rule of that faction which had inculcated the doctrine of passive obedience and the divine authority of kings. Fugitives, exiles, impoverished, dismayed, the fallen adherents of a political superstition sank before the indignation of their countrymen. Oxford, a prisoner in the Tower, trembled for his life; Bolingbroke fled to France, and openly joined the court of James III.; Ormond was a needy exile; Swift, spared by the lenient Whigs, was permitted to retreat to his deanery at Dublin; Prior, fallen almost to penury, lived upon a subscription to his poems. Never again was the extravagant theory of loyalty to rule in England. A new race of statesmen had sprung up, who had been educated in the tolerant spirit of Addison rather than the passionate bigotry of Swift. The crown had, in fact, become elective; it was slowly discovered that the king, the church, and the ruling caste should be the servants rather than the despots of the nation.

While England, taught by the gentle genius of Addison, had made some faint progress in refinement and common-sense, France, shorn of its military glories by the acute diplomacy of William of Orange and the successful generals of Queen Anne, remained lost in a dull stupor of bigotry and despotism that was to be broken only by the fierce convulsions of its revolution. Louis, in extreme old age, was still governed by the severe guidance of the Jesuits. It was even asserted that, like James II. of England, he had himself become a member of their powerful society, and might claim all those immunities and privileges in a future world that had been lavishly bestowed by grateful popes upon the followers of Loyola.¹ His reign had, at least, been illustrative of the principles of the Spanish saint. His two confessors, La Chaise and Le Tellier, had condoned all his vices and instigated all

his crimes. The slave and the tyrant of depraved women and designing men, Louis had swept on through life, the chief actor in a dreadful pageant, blind to the miseries of his people, confident only in his own glory. Yet the misfortunes of his later years might well have broken any heart less cold than his own. The sorrows and the humiliation he had brought upon France seem, indeed, to have given him little uneasiness. His selfish vanity was never touched by the woes of others; but within his own family a series of afflictions had fallen upon him that cast a dreadful gloom over the splendors of Versailles and the gardens of Marly.

Since Louis, on a chill and snowy night, attended by the Archbishop of Paris, his confessor Père la Chaise, and a few officials, had led the widow Scarron to the chapel of Versailles, and, kneeling with her at the altar, had exchanged the marriage-rings, but little peace could have remained in the palace, where the new wife was eagerly plotting to be openly acknowledged, and the legitimate princes refused to come into her presence. An alienation had arisen between the king and his son the dauphin; and Madame De Maintenon had become the patroness of the natural children of Louis, who had inherited all the evil passions of their parents. But when the Duke of Burgundy, the dauphin's eldest son, and heir to the crown, had married, amidst pageants of unprecedented splendor, Mary of Savoy, that amiable but heedless princess had won the regard of Louis, and the good qualities of the young duke, who had been educated under Fénelon, seemed to promise a happier era for the suffering people. Two sons were born to Mary, and the family of the Duke of Burgundy formed a centre of promise in the corrupt atmosphere of Versailles.¹

Death now suddenly descended upon the guilty court, attended by all the horrors of suspicion and of doubt. The dauphin was seized with small-pox, and died; Louis fainted in an agony of grief, but fled hastily from the infected chamber; his courtiers followed him; and the heir of the French throne was buried in haste, with only a few strangers to attend his funeral. In February, 1712, a box of Spanish snuff was presented to Mary. Soon after she died delirious, and with every trace of poison. Her husband, the duke, not long after perished in similar torments. Their eldest son also died. The Duke de Berri, second son of the dauphin, followed next, the victim of his own wife. The cry of poison resounded through the nation. Louis trembled for his own worthless life; and his great-grandson, a feeble infant, the Duke of Anjou, alone remained, the last of his direct heirs. Faint with repeated shocks,

¹ St. Simon, *Œuvres*, x. p. 106, paints the dangerous ambition of the Jesuits. Their threats terrified Louis.

¹ St. Simon gives details of the terrible corruption of the court and the king.

yet tranquil in the assurance of the protection of the Jesuits, Louis at length passed away (1715) from his magnificent palaces, haunted only by the shades of the dead, and left behind him a baleful memory, which future generations will rejoice to hide in a decent oblivion.

Such was the spectacle of the fall of the great, the miseries of nations, the barbaric glories and disasters of French vanity and Jesuitic intolerance, upon which Stella had gazed with a feeble attention, and in which Swift had played no unimportant part during the last years of Queen Anne; but for the dark-eyed, pensive maiden, now no longer in the bloom of youth, yet still singularly fair, the hand of destiny was tracing an intricate and touching fate that must survive in the annals of letters, when perhaps the names of Louis and of Anne are remembered only to be contemned. Swift had written each day to Stella a journal of the various events that had soothed his ambition or satisfied his pride; had named the great nobles who were his frequent companions, the power he had won in the counsels of the nation, the most minute events of his daily life, his dinners, his diseases, his giddiness, the misconduct of Patrick and the melancholy end of Patrick's lark, the adventures of the box of snuff, the heat of the weather; yet there was one passage of his London career upon which he was ever silent. He had found a new pupil, and Stella had learned by report of that gay and graceful rival to whom all of Swift's leisure was devoted.¹ Esther Vanhomrigh, the Vanessa of the mysterious romance, was young, wealthy, beautiful, a member of that glittering circle of Tory fashion in which her master was now moving with singular applause. Her father was dead, her mother kept a hospitable house, and here Swift found a friendly reception, and forgot in the eager homage of Vanessa his duty to his betrothed, the gentle pupil of Moor Park.

He woke suddenly from his delusion; and when the death of Anne drove him, a moody exile, to his deanery at Dublin, had resolved, perhaps, to part forever from Vanessa. On his return he found that grief and a natural jealousy had thrown Stella into a deep melancholy. Her health declined. A common friend carried her complaints to Swift; and, with strange reluctance and singular precautions, he at length determined to prove his constancy by going through the form of marriage.² The ceremony was performed secretly in the garden of the deanery by the Bishop of Clogher in 1716, but upon the condition that it was never to be acknowledged publicly, and Stella was still to live

apart from her husband in the same guarded way in which they had so long defied the scrutiny of the world. Agitated and gloomy, Swift had yielded as if to some fatal necessity in his mysterious marriage. Soon after, his friend Dr. Delany met him coming from an interview with the Archbishop of Dublin; he looked like one distracted, and passed Delany without speaking. Delany found the archbishop in tears; upon asking the reason, he replied, "You have just met the most unhappy man on earth; but of the cause of his wretchedness you must never ask a question." Swift hid himself in seclusion for several days after his marriage, and then came forth to resume his usual course of life, and to treat Stella only as a beloved and honored friend. Every year, on her birthday, he celebrated her virtues in graceful verses, and proved the sincerity of his affection by his devotion to her while living, the anguish with which he received the tidings of her death.

What fatal barrier existed to their perfect union, what strange confession Swift made to the Archbishop of Dublin, why he ever refused to publish his marriage with one he so deeply loved, no research has ever unfolded, and no tongue has ever told. Swift carefully preserved his secret; and even when his intellect sank into imbecility, upon one point he was always prudent. In all his writings he made no confession. The mystery of Swift and Stella sleeps with them where they were placed side by side in the Cathedral of St. Patrick. But conjecture has never ceased to explain their story. It was said that after his marriage Swift discovered that Stella was his sister, that they were both the children of Sir William Temple, and that the secret was maliciously revealed by Mrs. Dingley, Stella's companion, when the ceremony was ended. Several circumstances seem to confirm the theory. They had both been inmates of Sir William's house, had been treated by him with constant regard, and had received considerable legacies in his will. Some likeness was traced between them and their supposed father, and it was not incredible that one might have remained ignorant of the other's parentage; but Scott believed that he had perfectly refuted the theory.¹ By some writers it has been suggested that Swift was insane, and that his conduct toward Stella and Vanessa showed only the wild freaks of a madman. Others have accused his fierce ambition and pride, that led him to crush with cruel neglect his humble companion and wife. Some assert that he would save the life of Vanessa; that he married Stella, but loved her rival. But for all these conjectures no sufficient argument can be adduced.

¹ Scott, p. 227.

² The marriage of Swift and Stella is generally admitted (Scott, 239), yet in her will Stella entitles herself "spinster."

¹ Scott's argument is not conclusive. That Swift and Stella were brother and sister was believed by their contemporaries. See *Gent. Magazine*, 1755.

Meantime the unhappy Vanessa, constant in that love which she had openly declared to her master, had also followed him to Ireland, and lived at Marley Abbey, a small estate which she had inherited, near Celbridge, resolved not to be separated from him by the treacherous seas. Here, amidst the charms of a gentle landscape, the victim of a real passion saw her youth and beauty fade away in monastic seclusion. Her house resembled a cloister in form as well as in name. A river wandered bright and glad amidst green fields and graceful woods before it; a cascade leaped and murmured in the distance; the garden was profusely planted with laurel by Vanessa's own hand, in honor of her beloved; and here, in a bower furnished with two seats, and a table covered with writing materials, would Swift sit with his pupil, on those rare occasions when he visited her in her retirement, striving to moderate her fatal passion, but never revealing that secret bond that had separated them forever. Here, shaded by his laurels, Vanessa wrote those impassioned letters that served only to awaken alarm, pity, we may trust remorse, in the agitated breast of the husband of Stella.

Her sister, her only companion, died beneath her care, of a lingering disease; and in her solitude, torn by jealousy, conscious of Swift's close intimacy with her rival, yet ignorant of its cause, Vanessa, after eight years of patient expectation, resolved, by a daring step, to discover the nature of the tie that bound him to another. She wrote to Stella, asking her to reveal the mystery. Stella, in reply, told her of her marriage,¹ sent Vanessa's letter to Swift, and, filled with a just resentment, fled from Dublin, and from a husband whose cruel duplicity had well deserved her lasting scorn.

But for Esther Vanhomrigh, her bold effort to unfold the dangerous mystery proved the knell of death. In one of those fierce bursts of rage, the tokens of approaching madness which so often came upon him, and which was now excited to unusual intensity by the reception of Vanessa's letter from Stella, Swift rode instantly to Marley Abbey. No remorse for his own base conduct seems to have checked his selfish resentment; no pity for that fair and gifted woman, to whom he should have knelt in humble self-accusation, seems to have been thought of in his haughty delirium. With a terrible countenance he entered Vanessa's apartment, flung her letter upon the table, and when she asked him, with a trembling voice, to sit down, turned from her sternly, and rode hastily away.

A few weeks afterward Vanessa died, it was said of fever; but no one has ever mis-

taken the cause of her rapid decline. Her heart was broken. Until she received Stella's letter she had lived in a perpetual delusion, ever hoping that time would remove the unknown obstacle to her union with him whom she thought her lover, and for whom she had cherished an unbounded veneration, a singular devotion. The discovery of his faithlessness had turned her love to resentment, her respect to scorn. She at once revoked her will, in which she had left all her property to Swift, and gave it to strangers. She died amidst her shattered hopes, indignant, silent, and alone. At Marley Abbey are still shown two or three laurel-trees, from whose classic leaves Vanessa had once hoped to crown his immortal brow, and the garden, now tangled and neglected, from whence they had looked together on the shining river and the bright cascade.

At the news of her death, Swift, overpowered by remorse and grief, for two months hid himself in solitude, alone in his agony. He then came back to the deanery. Stella forgave him, touched by his distress; and once more they lived like brother and sister, careless of the opinion of the world. Still the same mystery hung over them, and still Swift, untaught by the mournful fate of Vanessa, refused to publish the secret marriage. But Stella's health, always delicate, sank under her painful circumstances. Calumny wounded her pure and gentle spirit. She in vain urged that vindication of her fame which Swift alone could give. At length she fell into a consumption, and was rapidly passing away. Yet still Swift refused, with unaccountable cruelty, to grant her last request. She was even removed from the deanery, lest, by her dying there, some scandal might be excited, and Swift was not with her in her last moments. But from his chamber in the deanery, agitated by no common grief, he might have seen the torches gleaming through the Gothic windows of St. Patrick's as they bore Stella, at night, to her grave in the solemn cathedral.¹

The great dean, idolized by the Irish, whose interests he upheld, wit, scholar, poet, the classic writer of his age, survived for many years his fair and gentle pupil. His fame ever increased; his wit filled the world with laughter; his power in Ireland was almost despotic. Yet no moment of happiness or of peace ever came to his troubled spirit. He always declared that he was weary of life, eager for death. His common parting words to his friends were, "May we never meet again." His mind at last was lost in silent idiocy. He died in 1745, and was laid in St. Patrick's Cathedral by Stella's side.²

Thus came and passed away the days of

¹ There is another version of the story, but it is allowed that Vanessa discovered the marriage.

¹ Wilde, p. 120.

² Recently their graves were opened, and their remains examined. Wilde, 120.

good Queen Anne, full of their joys and their calamities, their wars and triumphs, their pleasures and their pains; their heroes and statesmen, who rise for a moment above the paths of history, soon, perhaps, to sink forever in neglect; their princely and noble throngs, shining in a transient splendor; their patient multitude, rising slowly in knowledge and power. Nor did they pass wholly in vain. For still look down upon us from amidst their fading glories the calm countenances of Addison, Swift, and Pope, shorn of their coarser and baser elements, and living only as intellectual agents, governing all future generations at will by the power of mental culture, softening the rude, informing the dull, exciting emulation, and teaching forever, with no common success, in the great university of mankind.

A CURIOUS PREDICTION.

THE burning of Chicago has called attention to the accounts that have come down to us of the great fire in London in 1666—the only parallel, in fact, that exists to the recent calamity. That fire, which lasted four days, consumed about as much of London as the recent fire consumed of Chicago. In both cases the fire was the occasion of great popular excitement, innumerable rumors, and many ill-founded and unwholesome suspicions. The burning of London was attributed to the papists, and the monument of Wren, built in 1671 in memory of the fire, as Pope said,

“Like a tall bully, lifts its head and lies,”

by asserting the calumny in an inscription which has been obliterated during the present century. The frantic populace were further excited by reports that an army of French and Dutch had landed, and were marching to complete the destruction of the doomed city. There was much less loss of life during the London conflagration, on account, perhaps, of its slower progress, it having begun on Sunday, September 2, and raged until Wednesday morning. There was, perhaps, however, as much suffering after it, and charity was much slower and more irregular in its beneficent operations. Evelyn draws a gloomy picture of how “the poor inhabitants were dispersed in St. George’s Fields, and about Moorfields, as far as Highgate, and several miles in circle, some under tents, some under miserable huts and hovels; many without a rag, or any necessary utensils, bed or board, who from delicateness, riches, and easy accommodations in stately and well-furnished houses, were now reduced to extreme misery and poverty. The people who now walked about the ruins appeared like men in some dismal desert, or, rather, in some great city laid waste by a cruel enemy; to which was added the

stench that came from some poor creatures’ bodies, beds, and other combustible goods. I then went toward Islington and Highgate, where one might have seen two hundred thousand people, of all ranks and degrees, dispersed and lying along by their heaps of what they could save from the fire, deploring their loss, and though ready to perish for hunger and destitution, yet not asking one penny for relief, which to me appeared a stranger sight than any I had yet beheld.”

Singularly enough, the fire of London, while undoubtedly accidental, is claimed to have been twice distinctly predicted. Of course Nostradamus, who is well known to have announced in advance all the great events of the last three hundred years, had his opinions upon the subject of the conflagration, which he promulgated as early as 1555, to the effect that

“Le sang du juste à Londres fera faute
Bruslez par feu, de vingt les trois, et six.”

or, in other words, “The blood of the just spilled in London will require it to be burned with fire in three times twenty and six.” This was a pretty good guess on the part of the old astrologer, who claims to have arrived at his conclusions by means of “astro-nomical affections.”

The other prediction was once very famous; and, indeed, was thought at one time to have made the fortune of its author, and of the art of mundane astrology. That author was Mr. William Lilly, the astrologer—a conspicuous character in his day, and enjoying the reputation of being a particularly clever knave and accomplished impostor. His biographer, Zadkiel, claims, however, that Lilly was a good citizen, an honest, sincere Christian, and a thorough-paced believer in the art in which he was so great an adept. Lilly, in his capacity of professional astrologer, erector of nativities, and resolver of all sorts of *horary questions*, had been for many years publishing a sort of almanac, under the name of Merlinus Anglicus, Junior, in which he gave circulation to several of his remarkable predictions. Encouraged by the notoriety gained through this book, and perhaps by the fortunate result of some of his happier prognostications, Lilly, in 1651, published another *mundane* speculation, which, in accordance with the temper of the time, he entitled “Monarchy, or No Monarchy?” and in which, under the form of hieroglyphics (as he called them), he predicted several events. The most celebrated of these hieroglyphics were the one indicating the great plague of 1665, and the one—of which a facsimile is here engraved—to prognosticate the great fire of the next succeeding year. As will be inferred from the horoscope being introduced, this is an astrological symbol; the children reversed at the top of the picture

FAO-SIMILE OF THE ASTROLOGICAL HIEROGLYPHIC OF THE GREAT FIRE IN LONDON, SEPTEMBER 2, 1666,
PUBLISHED BY W. LILLY, IN THE YEAR 1661.

are intended for the zodiacal sign *Gemini*, which the astrologists feigned was the "ruler" of London; their headlong attitude over the fire indicates the complete mastery which that element would gain over the stricken city. The struggle to overcome the fire, the picture shows, would be vainly engaged in by both sexes and all conditions of the people.

Zadkiel, Lilly's editor and most fervid and uncompromising disciple, remarks that "these celebrated predictions were made by means of the motions of the fixed stars, as is evident by the words of Lilly, who says, 'The

asterisms and signs and constellations give greatest light thereunto.' The *Bull's North Horn*, a star which, Ptolemy says, is 'like Mars,' was, in the year 1666, when the fire occurred, in $\text{Gemini } 17^{\circ} 54'$, which is the exact ascendant of London. It was, no doubt, by this means Lilly judged the city would suffer by fire. The year 1666 was that in which that evil star was crossing the ascending sign of London. And as it is of the *fiery nature* of Mars, we need not be surprised that it produced such terrific results."

In consequence of the notoriety of his hieroglyphics, and perhaps also as a tribute to

the excited state of public feeling, Lilly was examined before the committee of the House of Commons appointed to investigate the fire on October 2, just one month after it occurred. He has handed down to us a rather vainglorious narrative of his examination, dwelling with great unction upon the exceeding civility shown him, and the curiosity manifested to hear him testify. Sir Robert Brooke, chairman of the committee, Lilly tells us, spoke to this purpose:

"‘Mr. Lilly, this committee thought fit to summon you to appear before them this day, to know if you can say any thing as to the cause of the late fire, or whether there might be any design therein. You are called the rather hither because, in a book of yours long since printed, you hinted some such thing by one of your hieroglyphics.’

"‘Unto which I replied: ‘May it please your honors, after the beheading of the late king.....I was desirous, according to the best knowledge God had given me, to make inquiry by the art I studied what might from that time happen unto the Parliament and nation in general.’ At last, having satisfied myself as well as I could, and perfected my judgment therein, I thought it most con-

venient to signify my intentions and conceptions thereof in forms, shapes, types, hieroglyphics, etc., without any commentary, that so my judgment might be concealed from the vulgar and made manifest only to the wise; I herein imitating the example of many wise philosophers who had done the like. Having found, Sir, that the city of London should be sadly afflicted with a great plague, and not long after with an exorbitant fire, I framed these two hieroglyphics, as represented in the book, which, in effect, have proved very true.’

"‘Did you foresee the year?’ said one.

"‘*I did not,*’ said I, ‘or was desirous; of that I made no scrutiny.’ I proceeded: ‘Now, Sir, whether there was any design of burning the city, or any employed to that purpose, I must deal ingenuously with you; that since the fire I have taken much pains in the search thereof, but can not, or could not, give myself any the least satisfaction therein. I conclude that it was the finger of God only; but what instruments he used thereunto I am ignorant.’

"The committee seemed well pleased with what I spoke, and dismissed me with great civility."

THE GOLDEN LION OF GRANPERE.

By ANTHONY TROLLOPE.

CHAPTER I.

UP among the Vosges Mountains in Lorraine, but just outside the old half-German province of Alsace, about thirty miles distant from the new and thoroughly French baths of Plombières, there lies the village of

Granpere. Whatever may be said or thought here in England of the late imperial rule in France, it must, at any rate, be admitted that good roads were made under the Empire. Alsace, which twenty years ago seems to have been somewhat behindhand in this respect, received her full share of Napoleon's attention, and Granpere is now placed on an excellent road, which runs from the town of Remiremont on one line of railway, to Colmar on another. The inhabitants of the Alsatian Ballon hills and the open valleys among them seem to think that the civilization of great cities has been brought near enough to them, as there is already a diligence running daily from Granpere to Remiremont; and at Remiremont you are on the railway, and, of course, in the middle of every thing.

And, indeed, an observant traveler will be led to think that a great deal of what may most truly be called civilization has found its way in among the Ballons, whether it traveled thither by the new-fangled railways and imperial routes, or found its passage along the valley streams before imperial favors had been showered upon the district. We are told that when Pastor Oberlin was appointed to his cure as Protestant clergyman in the Ban de la Roche, a little more than one hundred years ago—that was, in
